- G. Maddison. 3422. If you had remained a member of the firm, would you have looked upon it as certain that the firm would have had to take in Mr. Hickson, jun., as a partner? I really could not say. It is a thing to which I have not given any particular thought.
- 17 June, 1896. 3423. But you consider that it would be an advantage to have him a member of the firm? It was an advantage to some extent, of course, or he would not have been employed, I suppose.
3424. You tendered in company with Mr. Ewing for Contract No. 77, did you not? Yes.
3425. Have you before seen the plan upon the board in front of you—I mean the substituted plan upon the Monier system for Contract No. 77? No; it was not on the table when tenders were called for that particular work.
3426. You noted particularly the departmental plan upon which tenders were called for? We got a man to take the quantities off it for us. We trusted solely to him.
3427. But you saw the plan? Yes.
3428. Is it not a most elaborately furnished plan;—have you ever had, in connection with former sewers, to tender for dressed stone cornice work? No; there has been none of that class of work in anything with which I have been connected.
3429. Has there been any pointed double-pressed brick work? The sewers are all constructed with double-pressed brick, I think.
3430. But as regards the facing? That I could not say.
3431. You know the nature of an elliptic arch? Yes; to a certain extent.
3432. Is it not a most difficult arch to build? I could not say. It is more expensive, no doubt, compared with other arches.
3433. *His Honor.*] Where does the difference come in? In almost everything connected with it. Once the centering is set, however, the other work is about the same.
3434. *Mr. Parkes.*] Is it not very costly to make elliptical arches? I am a little bit fogged on that point.
3435. Did not the original design of Contract 77 strike you as being a very expensive one? It looked fairly expensive, no doubt.
3436. When tenders were called for it, did it not strike you as being peculiar that the designs should be so expensive? I did not give much thought to it at the time. We tendered upon the plan as it stood. We did not know any alteration was to be made in it.
3437. Or you would have saved yourselves the trouble of putting in your tender? Yes; we should have saved the expense of getting the tender made out. We should have saved, I suppose, £10 or £12.
3438. Were you upon the first deputation of contractors which waited upon me? I was upon one of the deputations, but I do not know whether I was upon the first or the last.
3439. There were two deputations, were there not? I could not say.
3440. Do you know whether they were before or after my speeches in the House? I think they were before your speeches in the House.
3441. On both occasions? Yes.
3442. Were you upon the first or upon the second deputation? I think that when we waited upon you, you said you had a good deal of information about the matter.
3443. Did you come with Mr. Ewing? No.
3444. Was he present when you were there? No.
3445. Did you come to me voluntarily? Yes, certainly.
3446. When you were with me, what did I say to you—did I instantly jump at your proposal? No; you did not seem very hasty in acting upon it.
3447. I insisted upon you gentlemen making sure of your facts, did I not? Yes.
3448. Upon what was said to me at that deputation, I mean—concerning Carter, Gummow, & Co.? Yes.
3449. Can you recollect the conversation? Yes; I think so.
3450. What was it? It was principally about the Monier contract. The grievance of the contractors was that they had not had a fair go at the tender-box.
3451. Were any other contracts taken into consideration? I think the extension of a contract at North Shore was mentioned.
3452. Any other? I believe there was something mentioned about the cutting of a storm-water drain at Johnstone's Creek.
3453. Was I not asked to put an end to the concessions which were being made to this firm of contractors? That is what the deputation was about. We wished to put everyone upon the same footing.
3454. Did you represent other contractors besides yourselves;—what did you tell me with regard to that? There had been no particular arrangement. Everyone was dissatisfied, and there had been a good deal of grumbling. There might have been half a dozen other contractors there.
3455. Can you tell me whether Mr. Gillan and Mr. Forrest executed contracts in connection with Messrs. Carter & Co. in this Colony before April, 1895? You mean, were they partners in the same firm?—Yes.
3456. They did work in this Colony with the same firm? No; Mr. Gillan did not in this Colony.
3457. Has Mr. Gillan property in this Colony? Yes.
3458. Can you tell me where it is situated? Yes; he has a place at Dulwich Hill.
3459. What would be about the cost of it? I could not say.
3460. Have you seen the place? Yes.
3461. What sort of a house is it? It is a double-frontage cottage with a large piece of ground.
3462. Is it worth £5,000? No.
3463. Would it be worth £1,500? I suppose it would be worth that or thereabouts when he bought it.
3464. Speaking as a business man, what would you consider the actual value of the property now? Property has gone down so much in value that I could not say.
3465. Is this the only property Mr. Gillan has in the Colony of which you are aware? It is all that I know of.
3466. Has Mr. Forrest property in the Colony? I could not say. I have heard him say that he had property in New Zealand.
3467. But you do not know if he has property in this Colony? No.
3468. Do you know whether he has freehold property at Marrickville to the extent of £5,700? I could not say.

3469. Why did you wish to leave the firm of Carter, Gummow, & Co.? Because I was getting dissatisfied. G. Maddison.
3470. On what grounds were you dissatisfied? That is a very broad question.
3471. Had you any particular grounds for dissatisfaction? Well, I suppose I had, or I should not have left the firm. Of course, if they had ordered me out I should have gone out. 17 June, 1896.
3472. You did not, when you were leaving, make any statement to Mr. Carter about the position of the firm? Just concerning my own settlement, that is all.
3473. *Mr. Smith.*] I think you said you were an unemployed contractor? Yes; as far as contracts are concerned.
3474. You are not a land valuer? No.
3475. You have not done anything in that way? No.
3476. You have not much knowledge of Mr. Gillan's private affairs and of his property? No.
3477. He is more likely than you are to be able to give a fair estimate of the value of his own property? Yes.
3478. Regarding the first conversation that you had with Mr. Carter near the Bank of New Zealand—was Mr. Ewing there at the time? Yes.
3479. On the second occasion the conversation took place when Mr. Gillan had come up from Adelaide? Yes.
3480. I think you said it was Mr. Gillan who mentioned that he had seen a wire to a certain effect? Yes.
3481. What was the effect of it? It was from Sydney.
3482. From whom was it said to have come? From Mr. Carter.
3483. To whom was it said to have been sent? He did not say to whom it was sent.
3484. Did he say that it was sent to any member of the firm? No; he did not mention that; he simply said that he had seen a wire which had been sent by Mr. Carter.
3485. The effect of the wire being what? Asking that Mr. Hickson, junr., might be taken into the firm.
3486. Did he say when the wire was sent? No; I could not give the date of it.
3487. Could you give us any idea of the time when that conversation took place? I think it was some time in May, 1895.
3488. Did he then say that the wire had been sent recently? No; he did not say when it was sent.
3489. And the wire, you say, was simply to the effect that Mr. Hickson, senr., wanted his son taken into the firm? Yes.
3490. It was not a wire giving directions that Mr. Hickson, junr., was to be taken into the firm? It was not quite that.
3491. It was not a direction that he was to be taken into the firm at any cost? I could not say. I remember that it was asked that he might be taken into the firm.
3492. As a matter of fact, however, Mr. Hickson, junr., was never taken into the firm? I could not say.
3493. You were a partner in the firm up to 1895? Yes; the final payment I received was in 1895. I gave notice of leaving in October-November, 1894. I took very little active part in the work after that.
3494. Up to 1895 Mr. Hickson, junr., was not a partner in the firm? I could not say whether he was or not. He was not a partner to my knowledge.
3495. Did you ever tell anyone that Mr. Hickson, junr., was a partner? No.
3496. Did you ever make a statement to the effect that Mr. Hickson, junr., was a partner in the firm? Certainly not.
3497. Never to anyone? Never.
3498. So that if that statement has been made upon your authority it is untrue? It must be. I never said that in any way.
3499. With reference to the telegram of which you have spoken did you ever see a copy of it? No.
3500. Did you ever undertake to obtain a copy of it? No.
3501. So that if anyone has said that you undertook to produce a copy of the telegram, it is not true? Yes; I could not produce a copy.
3502. With regard to this second deputation to Mr. Parkes, I think that you said that Mr. Ewing was not on the deputation at which you attended? No.
3503. Who else was there? Am I bound to answer that question.
3504. *His Honor.*] Certainly? Mr. Williams was with me.
3505. *Mr. Smith.*] Who were the other members of the deputation which then waited upon Mr. Parkes? I could not say. I was away when the rest came.
3506. Then you and Mr. Williams went in to see Mr. Parkes alone? Yes.
3507. And you were not present when the other contractors waited upon him? No.
3508. Did they wait upon him before or after you waited upon him? I could not say. Mr. Parkes said that he had received some information about the matter before.
3509. At all events, the others were not there at the time you were there? No.
3510. Who is Mr. Williams? A contractor.
3511. Is he a member of a firm, or is he a sole contractor? He is a sole contractor. At all events, in the case of the last work he did he had no partner.
3512. I think you said Mr. Parkes made sure of the facts when he received you, and that he did not seem hasty? Yes: I think he made sure of the facts.
3513. You were there you say in order to put an end to concessions which had been made to Messrs. Carter, Gummow, & Co.? To do what I could towards it.
3514. Concerning those concessions, what were the facts you made sure of;—were they referred to in any way? Which facts.
3515. The facts which I understand you to say Mr. Parkes made sure of before he listened to you? Well, there was the alteration in this particular plan at Annandale and the cutting of a stormwater drain at Johnstone's Creek. The specification said nothing about that at the time tenders were called.
3516. Were there any other grievances? Not that I know of.
3517. Those were all you knew about? Yes.
3518. You did not know of any other concessions which were alleged to have been made to these contractors? No.
3519. You were not working in Adelaide when Mr. Hickson, junr., was there? No.
3520. It was Mr. Gummow and Mr. Gillan who were down there? Yes.

- G. Maddison. 3521. When you went into this partnership it related to a large contract which had been taken up in Adelaide? Yes.
- 17 June, 1896. 3522. And Mr. Hickson, junr., was employed there? To the best of my belief.
3523. He remained there at work the whole of the time? Yes.
3524. He did not come to Sydney? Yes.
3525. When was that? I could not say.
3526. How often did he come? I think he was up for a holiday once, but I could not be sure about it.
3527. Did he come here upon the work of the firm at all? Not to my knowledge.
3528. He did not come here on business? No.
3529. He is an engineer, I believe? I think so.
3530. I believe he served his time here? I could not say.
3531. At all events he was doing engineering work for your firm in Adelaide? I think so.
3532. So far as you are aware he did not come here upon any business of the firm? Not to my knowledge.
3533. As far as you know it would be incorrect to say that Mr. Hickson had been going backwards and forwards between here and Adelaide? As far as I know it would.
3534. *Mr. Gummow.*] Could you tell me whether Mr. Hickson, junr., came up from Adelaide with Mr. Gillan at any time? I do not think he was here at the time Mr. Gillan was here. I never saw him.
3535. When Mr. Hickson, junr., was engaged by the firm, had we any contract in hand in Sydney? No; they were just about completed.
3536. How long after our employment of Mr. Hickson, junr., was it that we obtained a contract here? I could not say.
3537. Did we get the contract, when we did get it at all, through the tender-box? Yes; No. 69.
3538. Would it be twelve months after Mr. Hickson's employment by the firm? No.
3539. Would it be six months after? About eight or ten months.
3540. Did you make out the tenders for any of our contracts? No.
3541. Who made them out? You always made out the tenders.
3542. Since you left the firm you have tendered for other contracts? Once or twice.
3543. Have you obtained any contracts yet? No.
3544. Did you get second in the case of No. 77 Contract? No.
3545. If Messrs. Carter, Gummow, & Co. had not tendered a lump sum, or had not submitted their tender 28½ per cent. below the schedule rates you would have got the contract. What I mean is that it made no difference to you personally? No.
3546. It made no difference to your firm at all? I do not suppose it did.
3547. Did you ever tender with Mr. Williams? Yes.
3548. He is the man who called with you to see Mr. Parkes? Yes.
3549. You say you gave notice to the firm at the end of 1894 that you wanted to go out? Yes.
3550. You did very little active work you say after that? Yes.
3551. Were you being paid by the firm during the whole of the interval between your notice and your leaving? Yes; I was paid up to the latter end of April.
3552. *Mr. Parkes.*] When you first called upon me, I said I wanted to make sure of your statements, was not that what happened? Yes.
3553. Have you, yourself, heard other contractors complaining about the concessions given to Messrs. Carter, Gummow, & Co.? Yes.
3554. Other contractors, I suppose, would be likely to make statements to me beside yourself? Yes.
3555. You have seen the substituted plan in Contract 77? Yes.
3556. It is a structure entirely different from the original design? No doubt.
3557. You had no design upon which to tender for the Monier work? No.
3558. You might have beaten Carter, Gummow, & Co. if you had had a design upon which to tender? We might have done. At all events, we should not have been labouring under the difficulties we had to meet.

George Forster Hickson sworn and examined:—

- G. F. Hickson. 3559. *Mr. Parkes.*] You are a civil engineer, I believe? Yes.
- 17 June, 1896. 3560. You are the son of Mr. Hickson, the present Under Secretary for Public Works in this Colony? Yes.
3561. Were you employed in the Department of Public Works in the year 1893? Yes.
3562. When did you leave the Department? I think in May, 1893.
3563. Do you not remember when you left the Department? I can tell you from looking at my diary. I see from my diary that I left in April, 1893.
3564. In what month did you join the employ of Messrs. Carter, Gummow, & Co.? In May.
3565. What salary were you receiving when you were in the Department? £200.
3566. And in the employ of Messrs. Carter, Gummow, & Co., what salary did you receive? £200.
3567. Were you not latterly receiving £250? Yes.
3568. How came you to enter the employ of Messrs. Carter, Gummow, & Co.? I was in want of employment.
3569. But did you do so at the request of your father? I did so at nobody's request.
3570. Did you apply for the appointment? Yes.
3571. Did you make any arrangement with Carter, Gummow, & Co. that ultimately you were to become a partner in the firm? No.
3572. Was there any conversation between yourself and Messrs. Carter, Gummow, & Co. as to your becoming a partner at any time? No conversation that I can call to mind.
3573. Did you look for a partnership at any time? That is a little indefinite, I think.
3574. Are you absolutely sure that you did not have a conversation with Messrs. Carter, Gummow, & Co. relative to your becoming a member of the firm? I never had any serious conversation with them about it.
3575. Did you have a conversation of any kind with them in reference to the matter? No.
3576. You never had a conversation of any kind with them as to your becoming a partner in the firm? Not seriously; but such a lot of things are said which one cannot remember. 3577.

G. F.  
Hickson.  
17 June, 1896.

3577. You did not converse with any member of the firm about your being a member of it? No, never.  
 3578. You are positive of that? I am on my oath.  
 3579. When did you come up from the firm's work in Adelaide? At the end of July, 1895.  
 3580. Did Mr. Gillan then come up with you? No.  
 3581. Did he come up shortly afterwards? No.  
 3582. Before? I could not say. I do not know his movements.  
 3583. You know Mr. Gillan, I suppose? Yes.  
 3584. Does Mr. Gillan know your father? I could not say.  
 3585. Has your father ever had any conversation with Mr. Gillan? I do not know.  
 3586. What were your principal duties in the employ of Messrs. Carter, Gummow, & Co.? Chiefly alignment of the tunnels, levels, and occasionally quantities.  
 3587. On what date did you leave their employ? I received notice on the 1st April, 1896.  
 3588. When you left Sydney for Adelaide on the last occasion did you go with any member of the firm of Carter, Gummow, & Co.? No.  
 3589. You went by yourself? Yes.  
 3590. Who were the members of the firm in Adelaide at that time? Mr. Gillan and Mr. Gummow.  
 3591. Did your father know that you were going to those members of the firm? I think so.  
 3592. Why did you leave the employment of Messrs. Carter, Gummow, & Co. lately? They had no more work for me.  
 3593. They had not finished their contracts. They had plenty of work going on, had they not? What do you mean by plenty?  
 3594. They have started within the last two months another contract at North Shore? Yes; but there was nothing for me to do upon that.  
 3595. You actually left their employ later than the 1st of April, did you not? Yes; I had three months notice.  
 3596. Do you mean that you gave three months, notice? No; I took it.  
 3597. Had you any monetary interest in the firm apart from your salary? No.  
 3598. You had no interest in the Monier arch patent? No.  
 3599. You were paid every month, were you not? Yes.  
 3600. What was your monthly payment? I do not know at what stage of my engagement you refer to. I was not in receipt of the same salary during the whole of the time I was with them.  
 3601. I am talking of the later stages of your employment by them in 1896. What was your monthly salary then? I think it was £20 16s. 8d.  
 3602. Was April 27th the date you left the firm—do you remember? Do you mean the last day I was on the works?  
 3603. Yes? I can give you that from my diary. I see that I was last on the works on 30th April, 1896.  
 3604. Was not a cheque of £62 10s. paid to you on 27th April, 1896? I could not be certain about the date, but I think I received a cheque about that time.  
 3605. Of what payments was that cheque made up? It included the three months' notice.  
 3606. They let you go then and paid you for the three months? Yes.  
 3607. They paid you the cheque straight off on the 27th April for the three months? Yes.  
 3607½. Were they bound under an agreement to give you three months' notice? No.  
 3607½. Then why should they give it? Is it not usually done?  
 3608. *His Honor.*] What was your engagement—was it by the month? I got paid by the month.  
 3609. And nothing else was said? There was no agreement of any kind.  
 3610. It was an indefinite employment? Yes.  
 3611. But was it said that you were paid so much a year or so much a month? So much a year.  
 3612. You were paid monthly? Yes.  
 3613. *Mr. Parkes.*] There was no written agreement? No.  
 3614. There was no agreement that the firm were to give you three months' notice? No.  
 3615. There was no agreement for notice at all? No.  
 3616. You had nothing to do with account books or anything of that sort, had you? No.  
 3617. You had to do only with engineering work? Only with engineering work. Just measurements—that is all.  
 3618. Had Messrs. Carter, Gummow, & Co. an account? Not when I was with them.  
 3619. Had they anyone who kept books? What do you mean by books;—do you mean the bank book?  
 3620. I mean books of any sort? There were the usual office books for the payment of the men, pay-sheets, and so on.  
 3621. Had they an office book in which to record them? Latterly.  
 3622. Since when? I cannot give you the exact date, but it was three or four months before I left.  
 3623. They had no books before that? Not that I know of.  
 3624. What did the book in which they recorded these matters latterly consist of? It was simply the pay-sheets.  
 3625. They had no ledger? Not that I ever saw.  
 3626. While you were in the employ of Messrs. Carter, Gummow, & Co. were you living at your father's house? I went straight to Adelaide at the commencement, and after I came back I was living at home for about a fortnight, or perhaps a month.  
 3627. When you returned to Sydney permanently were you living at home? Not more than a fortnight or a month.  
 3628. Did you ever have any communication concerning contracts of the firm with your father? No.  
 3629. You were not delegated to see your father with reference to these contracts? I did not deal with him in business matters at all.  
 3630. In connection with your engineering duties you had not to come to the office? No.  
 3631. You did not come to check measurements and to ascertain if your measurements were correct side by side with those of the engineer of the Department? No.  
 3632. *Mr. Smith.*] Did you not come back from Adelaide before the end of July, 1895? No.  
 3633. From April, 1893, until July, 1895, you were in Adelaide working? Yes; for two years and three months I think.

- G. F. Hickson.  
17 June, 1896.
3634. Between the date when you entered the service of the firm in Adelaide in 1893 and the date of your return in July, 1895, did you come to Sydney at all? Yes, once.
3635. Was it on business? No, it was purely a private visit.
3636. You were on a holiday? Yes. I fancy it was at Christmas time. I see from my diary that I left Adelaide on 16th December, 1893.
3637. You were here for how long? I see that I was back on the works again on 19th January, 1894.
3638. During your visit to Sydney on that occasion had you anything to do with business relating to any of the contracts of Messrs. Carter, Gummow, & Co.? No.
3639. You had nothing whatever to do, then? No.
3640. That, you say, was the only occasion on which you were in Sydney between April, 1893, and July, 1895? Yes.
3641. When you came to Sydney in July, 1895, you were working here for the firm on some of their contracts? Yes.
3642. Who had charge of the sewerage work—who were the resident engineers upon the particular works upon which you were employed? Mr. Beveridge upon one and Mr. Millner upon another.
3643. Who was the supervising engineer? I think Mr. Davis was in charge of the storm-water contract, but I am not quite sure. I should not like to say for certain. The officers of the Department were all so mixed up at the time with the changes that were being made that I do not now remember.
3644. What were your duties upon the contract of the firm in Adelaide? I was working upon alignment and the levels of the tunnel.
3645. I suppose you had to work there pretty hard? Yes.
3646. You would not describe your post as a sinecure? Decidedly not.
3647. If anyone described your post as such it would be incorrect? I should say so.
3648. Sometimes you had to work all day on Sundays, did you not? Yes, frequently.
3649. Would this be a correct description of your duties—that you had nothing to do but to walk about and take photographs, and now and then use a theodolite on the works to no purpose;—would that be a correct description of your duties in Adelaide or in Sydney? It would be absolutely incorrect from the very start.
3650. I think you served your apprenticeship here? Yes.
3651. You said you were a civil engineer, I believe? Yes.
3652. Under whom did you serve? Under Mr. Moriarty, and after he left under Mr. Darley. My articles were made out to Mr. Moriarty.
3653. I believe Mr. Gillan was in Adelaide when you were there? Yes.
3654. You do not remember when he came up to Sydney, in 1895, before you came? No.
3655. It is absolutely incorrect to say that you came up with him in 1895, when you finally returned to Sydney? Yes.
3656. If anyone has stated that you came up here with Mr. Gillan some time in 1895, is that true? No.
3657. *His Honor.*] Were you not in the same boat, or in the same train with him? Never.
3658. *Mr. Smith.*] You did not come with him to Sydney in April or May, 1895? No; I never met Mr. Gillan in Sydney.
3659. You did not come to Sydney with him on any occasion? No.
3660. It is equally untrue, if it has been so stated, that while you have been employed by the firm in Adelaide you were going backwards and forwards between that place and Sydney for the firm? That would be equally untrue.
3661. *Mr. Gummow.*] At the time you were first engaged by the firm had they any contracts in Sydney that you know of? Not that I know of.
3662. And you were sent down to Adelaide to assist upon the work there? Yes.
3663. I want you to endeavour to remember whether there was any other partner in Adelaide at the time you arrived there besides Mr. Gillan and myself? Not to my knowledge.
3664. You do not remember any other partner being there? No.
3665. Do you remember going to the races the day after you arrived? Yes.
3666. Did you win any money? I did.
3667. Do you remember the drive we had after that, and a dinner? Yes.
3668. Who drove with you? Mr. Snodgrass and yourself.
3669. Was not Mr. Snodgrass a partner in the firm? I had been led to believe so.
3670. As far as you know he was? Yes.
3671. He would be in Adelaide, then, as well as Mr. Gillan and myself? Yes.
3672. Then in saying just now that you did not remember any other partner being there you made a mistake? Yes; I did not think of Mr. Snodgrass at the time.
3673. Do you know that he was or had been assisting on the work there? I believe he had.
3674. And he left soon after you arrived? Yes.
3675. When you came to Sydney at Christmas, 1893, did you come up on the firm's business at all? No.
3676. Did they pay your expenses? No.
3677. You paid your own expenses? Yes.
3678. You were on purely a holiday? Yes.
3679. Regarding your duties upon the contract in Adelaide, you said that you did the alignment and levels;—what alignment do you refer to? The centre line of the tunnel.
3680. Do you know how much tunnel work had been done? No. 2 had been done, and Nos. 3 and 4 had not.
3681. Would it have been possible for an engineer of the contractors to do all that work himself—would he be able to do the whole of that alignment by himself? No.
3682. He would require skilled assistance, you think? I should think so.
3683. You left Adelaide in July, 1895? Yes.
3684. Was the difficult alignment completed before you left—what I mean is, had the tunnel between the shafts been completed, permitting of their doing the rest of the alignment with ease? When I left lines had been dropped down all the shafts and the long base-line underground was completed.
3685. So that it was not necessary for you to stop when the really difficult work had been done? No.
3686. Therefore, you came up to Sydney? Yes.
3687. Had you duties to perform up here in connection with alignment and levels? Yes. 3688.

G. F.  
Hickson.  
17 June, 1896.

3688. Had you any cross-sections to take? Yes.
3689. And measurements? Yes.
3690. Measurements of the work generally? Yes.
3691. Did you not assist with the pay-sheets? Yes.
3692. You know young Mr. Forrest? Yes.
3693. Did you not between you look through the accounts to assist us? Yes.
3694. You were doing your best for the interests of the firm, were you not? Yes.
3695. Do you consider that you earned the salary they paid you? Yes.
3696. When you were in Adelaide you were paid at the rate of £200 a year? Yes.
3697. What was the length of the contract upon which you were employed? Between 4 and 5 miles, I should say.
3698. Did the contractors find you a conveyance? No.
3699. Did you have to find one yourself at your own expense? Yes.
3700. You had to hire and keep it yourself? Yes.
3701. And you had to pay for that out of your salary? Yes.
3702. You had to pay for your board? Yes.
3703. When you were in the Government Service, and when you were on outdoor work, did you get any extra allowance for being on that outdoor work? Yes.
3704. Did you receive any from the contractors? No.
3705. With regard to the cheque of £62 10s. which you say you received at the end of April of this year, it was for three months' pay you say—you having received notice on 1st April? Yes.
3706. Did you keep in touch with the firm throughout April? Up to the end of April.
3707. Then you actually worked for one month out of the three? Yes.
3708. Really, then, you received pay for only two months during which you did not work? That is all.
3709. You say you had no agreement at all with the firm? No.
3710. Do you consider that the firm at any time dismissed their employes without giving them what they considered fair play;—did you ever know of our doing such a thing? I never heard of it.
3711. With regard to being a partner of the firm—were you ever in that position? No.
3712. Did I, or did any other member of the firm, tell you that you were a partner? No.
3713. Did you receive any bonus from the firm? No.
3714. Did you get your expenses from the firm when you went to Adelaide? Going down and coming back I got my expenses.
3715. What did they amount to? About £15.
3716. Besides that £15, or thereabouts, did you ever get anything from the firm in addition to your salary? Not a penny that I can think of.
3717. Is it not a fact that when you went in to Adelaide on the firm's business you paid your own expenses, and never charged them to the firm? Frequently.
3718. How far were the works from Adelaide? Eighteen miles.
3719. Do you consider that the firm paid you a huge price for your expenses? I received none at all for going in to the city from the works.
3720. Were you a loser or a gainer from the visits you made to the city on behalf of the firm? I was decidedly a loser.
3721. *Mr. Smith.*] I think you told Mr. Parkes that you stayed with your father for several weeks when you came from Adelaide in July, 1895? Yes.
3722. Where did you go after that? To Forest Lodge.
3723. To lodgings? Yes.
3724. You were staying with your father, then, only while you were looking for lodgings? Yes.
3725. I think you said that when you were in the Department you did not get anything above your pay? I received an allowance.
3726. What did it amount to? 2s. a day.
3727. *His Honor.*] What was that supposed to cover? It was a travelling allowance to cover train and tram fares.
3728. *Mr. Smith.*] I think you said your salary was £200 when you were in the Department? Yes.
3729. *His Honor.*] When was your salary from the firm raised to £250? I cannot quite remember; but I think at Christmas, 1893.
3730. You say you never had any conversation with any member of the firm as to a partnership? No.
3731. Was any hint ever dropped, or any suggestion ever made, that you should enter into a partnership? Well, I suppose such a thing may have been mentioned, but there was never any agreement or any definite arrangement of any kind made.
3732. What sorts of hints or suggestions were made? I often expressed a wish, I believe, to become a member of the firm.
3733. And what would be said by the persons to whom you expressed such a wish? They never gave me any hope at all.
3734. The question was mooted only in a general way? Only in a general way.
3735. At what time would that be? I could not give you any idea.
3736. Was it soon after you went to Adelaide, or was it before you entered the service of the firm? I could not say. It was never really discussed at all.
3737. What I understand you to say is that a hint was dropped by you that it would be a good thing for you if you were to become a partner—is that it? I do not know how to put it. I never asked them to take me into the firm, and they never asked me to join it.
3738. Then in what sort of way was the matter mooted? I cannot exactly say. Nothing was mentioned concerning it with any degree of finality. No hope was held out to me that I should become a partner.
3739. But did you say to any member of the firm that you would like to become a partner? No; I think I never said that.
3740. Did you suggest that as you were an expert it might be to the advantage of the partnership that you should become a partner? No.
3741. But some hint of the kind was dropped, I understand? I thought I should be bettering myself if I could become a partner, but nothing of a definite character in any shape or form was ever said.

G. F.  
Hickson.  
17 June, 1896.

3742. What I want to arrive at is, what it was that was indefinitely said? I cannot remember.
3743. But whatever did occur occurred in South Australia? Yes. I saw Mr. Gummow privately just as often as I saw him officially, and we talked about various things—about other firms and matters of interest.
3744. And in the course of these conversations did you drop hints to him that you would like to be a partner of the firm? Yes; but in a purely private way.
3745. How did Mr. Gummow take these hints? He never gave me any encouragement at all.
3746. Was it a profitable concern—was the partnership making good profits out of the contracts they took up? I do not know.
3747. You assumed that it was? I had an idea that it was; but I did not really know anything about it.
3748. When you first went down to South Australia had contracts been cut very much, or were they going at fairly good rates? I do not know anything about that.
3749. It was there, I understand, that you did most of the work for the firm? Yes.
3750. And you say you know nothing about the rates of contracts then obtaining? No.
3751. You knew the schedule rates—the rates of payment—I suppose? No; I did not.
3752. You merely attended to the measurements, taking an interest in them and in nothing else? That is all.
3753. *Mr. Gummow.*] As a matter of fact, you lived upon the works? Yes.
3754. Where was I living? In North Adelaide.
3755. You often visited Adelaide, did you not? Yes.
3756. You often visited me at my private house? Yes.
3757. You often stayed there for the night, and we had frequent conversations upon all sorts of subjects? Yes.
3758. When you say that I held out no encouragement to you that you might one day become a partner, you say that which is absolutely correct? Yes.
3759. *His Honor.*] When you did leave the firm what was it that first led up to your leaving—was there anything more than a failure of work which led up to it? Not that I know of.
3760. Was any reason other than that given you when you received notice? No.
3761. Had there been any kind of dispute between yourself and the firm? No.
3762. It was simply that you were given notice that your services would be dispensed with? That is all.
3763. No explanation was given you? No.
3764. Did you not ask for any—did you not say, “This is rather a sudden affair”? It was not a sudden affair. I could see myself all the time that the work was drawing to a close.
3765. You had foreseen that you would have to go? Yes; it was very marked.
3766. *Mr. Gummow.*] Did we tell you verbally that your services would not be required after three months, or did we give you a letter? You told me verbally, I think.
3767. We gave you no letter? No.
3768. We had a conversation beforehand on the subject, had we not? Yes.
3769. And you could plainly see that the contract was practically ended? Yes.
3770. As to the new North Shore contract—do you remember speaking of it, and do you remember asking me if you were to go there? Yes.
3771. What did I tell you? I really forget what you told me.
3772. Did I say that we needed a contractors’ engineer on that contract? You said you did not, I think.
3773. Are there any members of the firm who are capable of doing their own engineering if they had the time in which to do it? Yes.
3774. If they were not too busy with other matters they could do it themselves? Yes.
3775. How many members of the firm are there who could use the instruments if they had the necessary time? Two, to my knowledge.
3776. Who are they? Yourself and Mr. Carter.
3777. *His Honor.*] Mr. Gummow, I understand, acquired more knowledge by practice during the time he would be carrying on these contracts than when he first went upon them? Yes. Of course, any man would gain experience from being upon them for a long time.
3778. *Mr. Parkes.*] Is not Mr. Carter a practical engineer? Not to my knowledge.
3779. Is he not capable of carrying out engineering works? Not to my knowledge.
3780. Is Mr. Gummow a practical engineer? Yes.
3781. He is capable of carrying out engineering works? Yes.
3782. Did you not know that Mr. Carter was a surveyor? Yes.
3783. Therefore, he would be capable of setting out work, would he not? I do not know. I never saw him set out work, and I never heard of his setting out work.
3784. Is Mr. Gummow an engineer by profession? Yes.
3785. *Mr. Smith.*] You are now employed by the Government of Western Australia? I think I am.
3786. *His Honor.*] You were when you left? I had applied for an appointment, but I do not know that my papers had gone through.
3787. But were you not in the service of the Western Australian Government? Temporarily until my papers went through.
3788. You were on the temporary staff? Yes.
3789. *Mr. Parkes.*] What pay were you getting in Western Australia as a temporary hand? 12s. a day. I was classed as foreman.
3790. Have you had any pay? I have not received any yet. I had to come away so quickly that I had not time to get it.
3791. Is there anything promised to you beyond what you are now getting? Yes; I had an appointment in view. I was only taking this 12s. a day while I was waiting for something to do.
3792. Then there is an appointment ahead of you under the Western Australian Government? Yes.
3793. Is it a certain one? The head of the office said to me, “Your papers will be through by the time you get back”; so I suppose it may be regarded as pretty certain.
3794. *Mr. Smith.*] What would be the pay attached to that appointment? I do not know.

FRIDAY, 19 JUNE, 1896.

John Carter sworn and examined:—

J. Carter.  
19 June, 1896.

3795. *Mr. Parkes.*] You are a contractor? Yes.
- 3795½. And the leading member of the firm of Messrs. Carter, Gummow, & Co.? No, not the leading member. We are all equal.
3796. But the firm is under your name? Yes; but we are all equally interested.
3797. Beyond the two small bank-books which have been produced, have you no other books upon which you conduct your business? No; we never keep any books. I have some more pass-books in connection with the account of Carter & Co. for which you asked the other morning.
3798. Do you not keep any ledger? No.
3799. Have you the butts of your cheque-books showing your transactions? Not for years back, but I have a few at home.
3800. For how long back would they go—would it be twelve months? I do not think so.
3801. Would you be likely to have the butts for six months? Probably.
3802. What has become of the others? They have gone into the fire or into the blacksmith's forge.
3803. You have the bank-books only, showing your transactions? Yes.
3804. Since 1894 have you had any other bank-books than those of Carter, Gummow, & Co.? Yes; Carter & Co.'s books.
3805. Is the account of Carter & Co. in operation at the present moment? Yes, it is. We are not doing any works under it, but we are receiving rents and are paying trifling accounts under it.
3806. Can you produce those books? Yes; I have them.
3807. I see that the books already produced deal with £70,000 received from the Treasury, and that Carter & Co.'s books which you say are in existence would deal with about £71,000, so that the transactions were divided between the two accounts? I do not exactly follow that.
3808. Certain contracts were paid to the account of Carter & Co., and others were paid to the account of Carter, Gummow, & Co.? That is correct.
3809. Will you now produce the books of Carter & Co.? Yes.
3810. Do the pass-books of Carter, Gummow, & Co. contain all the expenses of carrying on their business? Yes.
3811. And the books of Carter & Co. contain, I suppose, the distribution of the profits? No; they contain the workings of Carter & Co.'s old contracts.
3812. The payments of amounts in respect of those contracts? Yes.
3813. I see from Carter, Gummow, & Co.'s bank-books that various items have been paid as profit to certain partners;—they were retiring partners, I presume? Yes.
3814. I do not see any entry of profits paid to existing partners? No.
3815. Is there any entry of the payment of such profits in Carter & Co.'s books? No.
3816. I presume, then, that there were no profits upon the contracts? Yes, they are still in the bank.
3817. They are not yet divided up? We have not taken any.
3818. But you have taken salaries? Salaries only.
3819. During the last four years have there been no profits given to any of the existing partners? No.
3820. Only salaries? Only salaries. There have been temporary advances sometimes.
3821. *His Honor.*] Do you mean temporary advances against salary? Well, if I wanted £100 for a special purpose, I should draw it and have it charged against me.
3822. *Mr. Parkes.*] Mr. Baltzer, who was one of the holders of the patent for the Monier arch, received certain payments from Carter, Gummow, & Co.? Yes.
3823. I see he drew early in August 10 guineas; on 17th August, 20 guineas; in September, 15 guineas; in December, 10 guineas; early in January, 1896, 12 guineas; on 25th January, £60; on 22nd February, £20; 29th February, £32; 13th March, £73; and finally on 13th March, £508;—was Mr. Baltzer employed by you from August of last year? No; he was employed by us two or three months after he left the Government service. We employed him temporarily.
3824. What was the salary you paid him? £5 a week while he was working.
3825. Was the item of £60, which he received on 25th January, 1896, for the payment of wages also? It would be a general settlement of affairs between us. These amounts, besides wages, might include little temporary loans, and so forth.
3826. I presume there would be some profit arising from his interest in the Monier patent? Not the slightest; no profit has yet accrued upon that. It has been all loss.
3827. Have you received any percentage at all from the Government for the use of the Monier arch? Not up to the present time.
3828. I see that upon 13th March of the present year there was a payment of £508 to Mr. Baltzer? Yes.
3829. He has gone to Europe? Yes.
3830. He has gone to procure the Monier patent, has he not? He has gone to procure additional patents.
3831. But I mean the Monier? Yes; and any other system he can get hold of. He has gone to the Berlin Engineering Exhibition, and he is also visiting some dewatering works. He is investigating all these things with the view of getting up a scheme for the city abattoirs.
3832. Has he not gone to make more complete the Monier patent? There are new discoveries every day.
3833. As a matter of fact, are you not very uncertain about your rights in regard to the Monier patent? Not in the least.
3834. You have patented only the iron according to the drawings you have submitted? We have patented the construction of cement and iron, as far as I understand it.
3835. According to the drawings? According to the drawings and specification. [*Vide Appendix No. 18.*]
3836. If anyone chose to alter the shape of the iron as represented in your drawings, you could not prevent them from using it in compo.? I think so, certainly. I should endeavour to do so.
3837. Why did you not press your claim against Mr. M'Sweeney for the use of the iron? He has not used it yet.
3838. He has used iron in connection with concrete? Not yet.
3839. Not in his carrier? He has not built the carrier.

3840.

- J. Carter.  
19 June, 1896.
3840. But he is proposing to use it? As regards that, we must wait till the thing is built. We cannot claim in respect of anything which is not in existence, but we took the precaution of writing to him telling him that we intended to make the claim.
3841. Did you tell Mr. Baltzer anything in connection with the right to get this patent? No.
3842. You paid all the expenses of obtaining it? Yes.
3843. How long after you obtained the patent was it before you offered it for sale to the Government at £1,500? I could not tell you the date. [*Vide Appendix No. 7.*]
3844. Would it be about a month? More than that, I think.
3845. It was offered on 3rd April, 1893, was it not? I presume so.
3846. Do you not know of your own knowledge as a contractor that iron has at all times been used in connection with composition or concrete? I know it has been used as tie-bars to connect structures, and for that sort of thing, but I never saw it being used in the form in which we are now using it.
3847. You cannot hold a patent for ordinary construction;—there must be some special reason? There must be some special reason.
3848. If anyone used a shape of iron different from that definitely prescribed by your patent you would have no action against them? I should certainly try the matter.
3849. As a matter of fact, were you not so dubious about your patent that, to put an end to your doubts, you sent Mr. Baltzer to Europe to perfect it? Certainly not.
3850. Then why did you send him only in April of this year instead of at an earlier date? Simply because it was only convenient at that time. There was no special reason for it. I have already explained that he had half a dozen errands.
3851. How did you make up the exact sum of £15,500 when you tendered upon the Monier system;—did you go into the quantities of the work? I could not tell you. That is not my work at all.
3852. Who made up the tender? Mr. Gummow and Mr. Snodgrass. Mr. Gummow principally. I might say, to put an end to that question, that I never made up a tender in my life.
3853. *Mr. Hickson.*] Did you ever make any payments to Mr. Baltzer when he was in the Government service? No.
3854. The first payment to him I understood from Mr. Parkes' questions was in August, 1895? Yes.
3855. Do you happen to know when Mr. Baltzer left the Government service? No.
3856. He was not in the service at that time, was he? I could not tell you. I might have lent him £10 then. I know that I did so on one occasion, and he paid me back either the next day or the next week. I cannot remember when he left the Government service. I did not take much interest in the matter.
3857. I think it was you who engaged my son on behalf of the firm? I did.
3858. Did I ever directly or indirectly ask you to employ him before you had so employed him? No.
3859. Never directly or indirectly? No.
3860. You engaged him on an application from himself? Yes, at North Shore.
3861. Without any interference on my part? Yes.
3862. You engaged him to go to South Australia, did you not? Yes, to Adelaide.
3863. He went there almost immediately afterwards? After a week or two, I believe.
3864. When did he come back to Sydney? Last year.
3865. It has been said in evidence that he came back in July, 1895;—up to that time had he had any connection directly or indirectly with any of your firm's contracts in New South Wales? No.
3866. Did he ever come up from Adelaide in connection with them, either with Mr. Gillan or on his own account? No.
3867. With reference to the telegram which has been mentioned, did you send a telegram to either Mr. Gummow or Mr. Gillan in Adelaide in which you made a statement to the effect that it was necessary to take my son into the firm? I did not.
3868. Do you know of anything that would give rise to such a report? I do not.
3869. *Mr. Gummow.*] I would like you to be a little more explicit with regard to the business of Carter, Gummow, & Co., and Carter & Co. I think you said that the whole of the payments which were made in connection with the transactions of Carter, Gummow, & Co. were made from their account? Yes.
3870. Under whose name was Contract No. 79A carried out? Under the name of Carter & Co.
3871. Were the payments to Carter & Co. made into the account of Carter, Gummow, & Co., or into the account of Carter & Co.? Into Carter & Co.'s account.
3872. Were the expenses connected with the contract paid out of Carter & Co.'s account, or out of Carter, Gummow, & Co.'s account? Out of Carter, Gummow's account.
3873. In what way did you arrange between Carter & Co. and Carter, Gummow, & Co.? The amounts were transferred, and the two accounts were balanced. The indebtedness of Carter & Co. to Carter, Gummow, & Co. being arrived at from the Bank-books.
3874. Contract 79A was carried out under the name of Carter & Co., and the payments made into that account were afterwards transferred to the account of Carter, Gummow, & Co.? That is correct.
3875. In the meantime Carter, Gummow, & Co. paid the expenses in connection with the contract? Yes.
3876. Did Carter & Co. pay any of the expenses in connection with it? No.
3877. As to Mr. Hickson, junior, did you ever give or make to him any payment in any way other than his salary or his expenses to Adelaide? No.
3878. You never gave him anything in the shape of a bonus, commission, or profit out of the concern? No.
3879. Do you know whether any other member of the firm ever did so? I am not aware of its being done. I presume you would not call a two-months' salary, paid to him in connection with his three-months' notice, a bonus.
3880. If regard to his engagement, did he come to you or did you go to him? He came to me.
3881. Did you go to his father first? No.
3882. You engaged him upon his own application, and without his father's sanction? Yes.
3883. You engaged him entirely upon his own application? I did.
3884. And you sent him down to Adelaide? Yes.
3885. Why did you send him down there;—did you ask me whether I wanted him or not? I engaged him upon my own responsibility, knowing that you required someone.
3886. When you engaged him, did you send me word? I engaged him first and told you afterwards that I had done so.
3887. In writing to me you told me that you had engaged him for me? Yes.
- 3888.

J. Carter.

19 June, 1896.

3888. What did I reply to you? I do not remember the words, but I recollect that the meaning of the reply was, "Send him along."
3889. Did you consider his presence necessary in Adelaide to help to do the work? Yes.
3890. Had I any assistance before Mr. Hickson, junr., came to Adelaide? Yes; Mr. Snodgrass was there. I also was there a little while.
3891. Is it not a fact that Mr. Snodgrass was there assisting me at the time Mr. Hickson, junr., came? Yes.
3892. Did Mr. Snodgrass return to Sydney shortly afterwards? Yes.
3893. Was he needed upon any contract here? Certainly—upon No. 79.
3894. From your knowledge of what Mr. Hickson, junr., had been doing, you knew that he was an engineer, and that he could use the instruments? Yes; I knew the contract upon which he had been employed.
3895. *His Honor.*] Which was that? Carson and M'Sweeney's outfall works. He was the Government Assistant Engineer.
3896. *Mr. Gummow.*] Could Mr. Snodgrass use the instruments? Yes.
3897. Was Mr. Snodgrass my superior officer in Adelaide, or was he my assistant, or what was he? I should say, under the circumstances, that he was an assistant.
3898. He was an equal partner with myself, but he was an assistant to me at that time—that is to say, I had charge of the work? Yes.
3899. And actually he assisted me in any alignment or levels I required;—I presume you understand that? Yes; I was there some part of the time.
3900. You saw the work in which he was assisting me? Yes.
3901. And did you consider that Mr. Hickson, junr., could assist me in a similar way? Certainly, or I should not have sent him.
3902. Do you know Mr. Snodgrass's salary;—was it larger than that which Mr. Hickson, junr., received? He received his usual salary, £10 a week.
3903. Would it have been wiser for the firm to keep Mr. Snodgrass there than to get someone at a cheaper salary to assist? As far as I understood, it was not a matter of keeping Mr. Snodgrass there at any salary. He had to come back in connection with other matters.
3904. It was to the benefit of the firm to send someone down there at a smaller salary to assist me? Yes.
3905. You considered it for the benefit of the contract that I should have someone to assist me? Yes.
3906. Do you know in what year Mr. Hickson, junr., was sent down to Adelaide? In 1893, I think.
3907. Do you know whether I had any other duties to perform besides the carrying out of engineering upon the Adelaide contract? Yes.
3908. Where were they? In Melbourne.
3909. I had often to go there in connection with the firm's business? Yes.
3910. What was the business? Tendering for contracts. We were tendering for twelve months.
3911. Were they large contracts? Very large.
3912. Did the doing of that work take up a great deal of my time? Yes.
3913. Did you consider that the contract in Adelaide could have been left without engineering skill in the meantime? It could not.
3914. As to the matter of Mr. Hickson, junr., becoming a partner;—did you ever suggest that he was to become a partner? No.
3915. Did you ever hold out any encouragement to him to believe that he might one day become a partner? Not the slightest.
3916. Did you not, on the other hand, damp him, as it were,—instead of encouraging him did you not rather discourage him? Certainly I did. As far as I can remember the matter only cropped up once between us conversationally, and then I sat upon him, as it were.
3917. *His Honor.*] When and where was that? During his trip here. When he was on his holidays I believe. He was always anxious to better himself, I presume. We had seven partners in the business, and I thought that quite enough.
3918. *Mr. Gummow.*] Actually he was never a partner in the firm? Never.
3919. *Mr. Parkes.*] Did you ever have any communication in any way, verbally or written, with Mr. Hickson, senr., concerning the appointment of his son? No.
3920. Had you not any at the time of his appointment? No.
3921. You say that Mr. Hickson had been employed upon Carson and M'Sweeney's contracts? Yes.
3922. He was under the Government? Yes.
3923. Did he come direct from that contract to you? Yes.
3924. Had he any employment with which he might have gone on at M'Sweeney's? Certainly not.
3925. The work was going on was it not? Yes; but he was retrenched.
3926. But if there was need for an engineer upon that work why should he be retrenched? That is a departmental matter. I might guess at it but I could not definitely say the reason.
3927. You wrote to your partner in Adelaide you say, stating that you had engaged Mr. Hickson, junr.? Yes, I wrote to Mr. Gummow.
3928. Have you a copy of that letter? No.
3929. Could you produce the letter? No.
3930. Can you tell us exactly what you said in the letter? No; I could not tell you the exact wording of it. I have already told you the meaning of it. I simply informed him that I had engaged Mr. Hickson junr., as an assistant engineer, and I presume, he had no objection, or something to that effect.
3931. Would you make an effort to obtain that letter? I know it is utterly impossible to obtain it. It is of no use saying I could do so.
3932. *His Honor.*] Do you not keep copies of letters of that kind? Mr. Gummow, I should have explained, was in sole charge in Adelaide, and looked after the interests of the firm there. I looked after the commercial interests of the firm here. I was in the habit of writing to Mr. Gummow what might be termed friendly letters, informing him, among other things, how the business was going on in Sydney. They were chatty letters, so to speak. In one of these letters I remember telling Mr. Gummow, among other items of news, that I had sent down Mr. Hickson, junr. So far as Mr. Gummow's letters to me are concerned, they were absolutely of no importance, and, as a rule, I tore them up in the street directly I had read them.

- J. Carter.  
19 June, 1896.
3933. Before you put on Mr. Hickson, junr., had you not an engineer named Chiene in your employ? Yes.
3934. You removed him to make room for Mr. Hickson, junr.? No. Mr. Chiene had gone out of our employ long before that.
3935. Is it not a fact that he left your employ a month only before your engagement of Mr. Hickson, junr.? No.
3936. You are sure of that? Yes; certain of it.
3937. He did not leave just as Mr. Hickson entered your employment? No. Your question took me rather by surprise, because I had an impression that Mr. Chiene left our employ years ago. He was engaged for a fixed time, and at the expiration of that time he left.
3938. It was July, 1893, when Mr. Hickson, junr., left Adelaide? I think so. It was about this time last year.
3939. Did he not then go upon one of your works in Sydney as an engineer? Yes; he was brought back for that purpose.
3940. To take charge of a work here? No.
3941. But to act as an engineer upon it? Yes.
3942. What did you pay Mr. Chiene? £300 a year.
3943. *His Honor.*] How was it that the firm first came across the Monier patent, and formed the idea of patenting it out here? It was through Mr. Baltzer. He was an engineer himself, and he was always looking into engineering subjects. He was a friend of ours—a personal friend, I might say.
3944. And he mentioned it to you? Yes.
3945. As a good thing? Yes. I might tell your Honor that up till now we have spent £2,000 in tests, patenting, and so forth.
3946. Would that include the tests that were made at Johnstone-street aqueduct? Yes; the figure I have given you is what it has roughly cost us. It has been an expensive experiment.
3947. You said that so far there had been no profit upon it? Absolutely none.
3948. No profit from the use of the Monier patent? None.
3949. As far as the work has gone on on these two aqueducts, can you see at present whether you are making a profit or whether you are making a loss, or how matters stand? We can see that we shall come out on the right side, but not to any great extent. As to separating the Monier from the other work at present, I have not gone sufficiently into the matter to be able to do that. We are waiting until the contract is finished.
3950. You cannot say, then, as regards the Monier part of the work itself, how you will come out? No; but we shall not lose. We shall probably make a little.
3951. With reference to this telegram which has been referred to, do you remember whether you ever sent a telegram to Mr. Gummow in which Mr. Hickson's name was mentioned at all? I do not remember it.
3952. Are you sure you did not? Quite.
3953. At no time? No.
3954. You have spoken of the firms of Carter & Co. and Carter, Gummow, & Co.? Yes.
3955. During the year 1895 who were Carter & Co.? Carter & Co. were Messrs. Carter, Snodgrass, and Forrest. They were actually merged into Carter, Gummow, & Co.; but Carter & Co.'s contracts were not completed. Consequently, an account had to be kept open until final payments were made.
3956. The only reason for the continued existence of Carter & Co. as distinct from Carter, Gummow, & Co. was for the purpose of working out the old contracts which Carter & Co. had taken? Yes.
3957. Before Carter, Gummow, & Co. came into existence? Quite so. More especially with regard to Contract 79A at North Shore, which was practically an extension of Carter & Co.'s own contract.
3958. So that Contract 79A was actually Carter & Co.'s? Yes; but being partners in the other contracts we put it into Carter, Gummow, & Co.'s business. It had, however, to be carried out under the style of Carter & Co., and all payments were made into Carter & Co.'s account. That is the reason for the existence of Carter & Co.'s account at the bank.
3959. *Mr. Smith.*] As to Contract 79A, would the name of Mr. Gummow or Mr. Gillan be recognised in that contract by the Government? No, the only names would be mine and Mr. Snodgrass's.
3960. And Mr. Forrest's? No.
3961. *Mr. Gummow.*] You say you wrote me certain letters;—did you mean that you wrote them to me or to Carter, Gummow, & Co.? To you personally. I have already explained that.
3962. Your letters were not business letters to Messrs. Carter, Gummow, & Co.? No.
3963. They were private letters in which business subjects were often included? That is correct.
3964. Coming back to the employment of Mr. Hickson, jun., how did you happen to know that I would require him;—had you seen me much before that time? Yes; I was in Adelaide by your special request about a month before.
3965. Would it not be less than a month before? I am giving you an extreme date. Probably it would be within a fortnight.
3966. When you were there was there any conversation in reference to the general business of the firm, or were you there on a holiday? I was there on the firm's special business to look into the working of the contract.
3967. As to Mr. Gillan, did you write to him as you wrote to me? No.
3968. Did you send a telegram to him? No.
3969. Did you ever write to him once? Not to my recollection—in fact, I am sure I did not.
3970. And you never sent him a telegram? No.
3971. To whom would a telegram such as that referred to be sent if it were sent at all? It would be sent to you.
3972. As to Mr. Chiene, Carter & Co. had him in their employ for a time? Yes.
3973. What engagement had he? A two years' engagement.
3974. Do you remember his meeting with an accident? Yes.
3975. Was he laid up for any length of time? Yes; he was in St. Vincent's Hospital for a considerable time.
3976. Did you pay him a salary while he was laid up? Yes.
3977. Did you employ anyone in his place while he was laid up? Yes.

3978. Then you were paying him his salary while you were at the same time paying someone else to do his work? Yes.
3979. You did not deduct from his pay the salary of the man who was doing his work? No.
3980. How did Mr. Chiene get hurt—was it on the works? No; he was jumping out of the tram going to the races.
3981. Did he ever come back to the works? Yes.
3982. You occupied him to the full extent of your agreement? I did.
3983. Had you ever assisted him since? Yes; repeatedly.
3984. Was there any reason why you felt bound to assist him? No.
3985. Have you seen him within the last six months? Yes.
3986. Did he tell you that he was in a poverty-stricken condition? Yes.
3987. And what did he ask you to do for him? Well, I should prefer not to answer questions of this kind. He did not ask me to do anything, but he came down to the works with a subscription list for himself. I saw him in the yard and I said, "Hallo, Chiene, what are you doing here?" He said, "To tell you the truth, I am very hard up."
3988. Did you assist him? Yes.
3989. For any length of time? Yes. I paid his baker's bill for three or four months.
3990. Were you bound to do that? No.
3991. It was merely a transaction as between one man and another? Well, I was sorry to see an old servant in that state.
3992. *Mr. Parkes.*] What was the date of your entering into your partnership with Mr. Gummow? In August, 1892.
3993. And you engaged Mr. Hickson, junr., when? In April, 1893.

J. Carter.  
19 June, 1896.

George McCredie recalled and further examined:—

3994. *Mr. Parkes.*] You have made out comparative estimates in respect of Contracts 101, 112, and 77? G. McCredie. Yes.
3995. *His Honor.*] Do you mean 77 according to the departmental plan or according to the Monier plan? According to the departmental plan and the Monier plan also. 19 June, 1896.
3996. *Mr. Parkes.*] In regard to Contract 112—Mr. Sweeney's contract—will you tell His Honor what you make out to be the area of the carrier, and also the cost per foot of the aqueduct? The area of the carrier of No. 112—that is, the full section—is 41.22 superficial feet, and the cost per foot run is £5 6s. 7½d. [*Vide Appendix F.*]
3997. That is for the whole work? Yes.
3998. Taking the Monier design in No. 77 Contract, what do you make the figures? The per foot run, including the foundations, as in the other case, comes out at £3 2s. 3½d. The area of the carrier at White's Creek is 11.56 superficial feet, and at Johnstone's Creek 13.5 superficial feet.
3999. It is only about one-third of the capacity of the carrier in Contract 112? Yes; about one-third.
4000. Mr. Bage, in his report, says that Contract 101 (Mr. Ahearne's) works out for two sewers at about £10 16s. 1d.;—will you tell His Honor what you worked this contract out at, taking one sewer? The cost according to my figures is £4 15s. 4½d. per foot run for the carrier.
4001. What was the capacity of the one 6-foot barrel? 28.27 is the area.
4002. *His Honor.*] When you say area do you mean the full section or the carrying area? The area of the surface right round.
4003. You mean when it is absolutely full? Yes.
4004. *Mr. Parkes.*] The result of your investigation is that you find the departmental design for Contract No. 77 more costly than the other two? Yes. Taking the departmental design and considering the area, it is more costly.
4005. There can be no doubt about that? No doubt.
4006. You have been very careful with your checking? Yes. I have gone through these figures very carefully.
4007. Taking Contract 101 in the proportion of one carrier, what is the comparison between that and Contract No. 77? The comparison would be this—the 6-foot barrel drain in No. 101 is £4 15s. 4½d. per foot run with an area of 28.27 superficial feet, as against £5 1s. 3d. per foot run with a capacity, in the case of the White's Creek aqueduct, of 13 feet, and in the case of the Johnstone's Creek aqueduct of 14 feet, taking the departmental design in Contract No. 77, or (say) about one-half the capacity.
4008. *His Honor.*] By the Johnstone's Creek aqueduct, you mean the aqueduct nearer to Sydney? Yes.
4009. *Mr. Parkes.*] Why is it that the departmental design for Contract No. 77 is so much more expensive than the others;—what is the difference in the work? There is a most extravagant class of work in that design. For instance, there is the tuck-pointed brickwork, the stonework, and a heavy concrete. It is more expensive in every way. [*Vide Appendices A, F, and C.*]
4010. The concrete is very high-class? It is first-class concrete for the work. You could not put in better.
4011. As regards Contract 77, have you taken out a rough measurement of the cost per foot run of the tunnelling and the sewer work in the tunnelling? No. I have not taken it out yet.
4012. Will you prepare that for us? Yes.
4013. Will you tell me the exact cost per foot run of the tunnel work, upon which you are engaged for telephone wires? I have not the exact particulars with me, but I can get them. We have them all worked out.
4014. Cannot you say what the cost is from memory? It will be £2 odd per foot run.
4015. How many shillings? I could not say from memory.
4016. It would not be much over £2? I think it would be £2 3s. and something per foot run. [*Vide Appendix No. 15.*]
4017. It would be rather elaborate work, because it has to carry, with the wires, insulators and other things of that description, has it not? It is strong work. It is 9-inch brickwork built in cement on a solid concrete bottom.
4018. What is the size of the chamber? Five feet 9 in. high by 4 ft. 6 in. wide. [*Vide Appendix G.*]
4019. Besides your lining, have you not concreted solid all round it? We have not concreted solid round it outside, but it has been packed solid.

4020.

G. McCredie. 4020. With what? Ballast.

19 June, 1896. 4021. I want to take you back to the evidence you gave when you were last here in connection with the Monier arches;—have you since looked over your quantities? Yes.

4022. And you are perfectly sure of them? I am perfectly satisfied with them.

4023. Have you not allowed ample to pay for builder's risk, profit, and things of that sort? I reckon from my quantities and from the prices I base them on, that there is 10 per cent. profit on the whole concern.

4024. To cover everything? Yes.

4025. If you, as an engineer, had brought to you a patent and you were asked to get one of your clients to use it, on whom would you throw the risk of the patent? You mean if the thing were being introduced?

4026. Yes? I certainly would throw the risk upon the parties who introduced the patent. If there was any great risk I should be very dubious about having anything to do with it.

4027. Would you think of asking your client to pay for the risk? I do not think it would be a proper thing to ask him to pay for such a risk. When a person is introducing a new patent it is to his advantage to get an opportunity to introduce it.

4028. From your practical knowledge, what do you think will be the result of this Monier construction, seeing that it is composed entirely of compo and iron? That I could not say. I regard these aqueducts simply as an experiment. You must have experience in such matters; you must use it in a structure before you can judge as to whether it will stand properly.

4029. Do you think three years is sufficient maintenance in the case of such a risk, supposing the life of the sewer to be 60 years? That is a question. Three years does not seem a long time for which to guarantee a job of that sort, especially when the work is supposed to last for such a long time.

4030. Have you ever used iron in concrete and compo. work? Yes; both in compo. and concrete work.

4031. Have other architects and engineers done so? I suppose so.

4032. Would they do it now, do you suppose? Well, I would do it myself if I wanted to use the materials.

4033. You would use iron in cement or compo. at the present time without any fear in regard to any patent? Yes, if I wanted to use it I should use it in the same way as it was used in these Monier arches. I do not regard the so-called Monier patent as a patent at all. We have used ironwork in the construction of cement and concrete structures ten years ago. I have often used it in my own business.

4034. Since you gave your evidence the other day you have paid more attention, have you not, to the way in which this Monier aqueduct work is being constructed on Contract 77. You have seen the construction? Yes.

4035. How many centres are the firm using in the construction of this work? Upon this particular work they are apparently using only two centres.

4036. That is all you could see? Yes.

4037. How have they built the centres? They are built in two segments.

4038. They are not in one piece? No; they are made of Oregon timber about 4 inches thick. They are in three pieces shaped to the contour of the arch. They are built up one on each side where the arch is to be erected, and then a piece is fitted in the centre. It is a very simple construction, and I do not see anything special about it. It is ordinary soft-wood scantling.

4039. Is there any difference between these centres and ordinary centres? No; if there is any difference at all they are more simple in construction than an ordinary center.

4040. You observed closely the way in which the ironwork was being put in? Yes.

4041. Is it being put in all in one piece or in many pieces? It is put in in lengths which are fastened one close against the other with wire. They are about 4 inches apart.

4042. Do they put these pieces in as the work goes on? Apparently.

4043. They do not make in the first place a complete arch of iron-work? No; I do not see how they could possibly do the work in that way.

4044. *His Honor.*] Did you see a big arch being built? They were not putting stuff in when I was there, but from what I know of the class of work, and how the compo. was prepared for putting in, I could give you a fair explanation of it. The large arch was in readiness for the putting in of the stuff when I was there, and they were fitting up the principals of the others. The arch was being put up in just the same way as I described just now. There were the principals on each side, and the segment in the middle was fixed in, with a straight piece braced up from the sides. The top was boarded over with ordinary boarding, the same as would be used in ordinary arches for any work of a similar description. The sides are then boxed in. The concrete had apparently been mixed on the bank right at the side, and a plank was running right out to where the arch was to be built, so that the stuff could be barrowed right up to the place, put on the board, turned over, and placed in position. If I were building the arch, that is the way in which I should carry it out. I would have the compo. put in on the top of the boards. I should have my distance pieces put in at the distance required for the grill, and I should then work all my face over up to the level of the grill, and ram it well in. I should then fill in on the top in the same way as in the case of ordinary work.

4045. *Mr. Parkes.*] Is not that the way in which they are doing this work? It is the way in which it is being done as far as I can see. I was very particular about this point, on account of Mr. Hickson saying that there was such a difference between my price for the compo. and the Department's price. I wanted to find out whether I had made a mistake or not. Had I found that I was mistaken I should have said so at once. I could see nothing special at all in the mixing of the stuff or the putting of it in.

4046. *His Honor.*] Do I understand you to say this—that a layer is in the first instance laid upon the centering and that the grill is then laid upon that in sections? I do not know if they are doing the work in that way, but I think they would be because that is the only way in which it could be done properly. The stuff would have to be rammed before the grill was put on, because there are only 4 inches of space between the iron rods, and if the compo. were put through the grill there might then be some difficulty in connection with the ramming.

4047. Would it be possible to ram it in thin layers as you describe? Yes; it soon consolidates. In fact, it is not good unless it consolidates soon.

4048. Can you say whether the grill is, as a matter of fact, finally made in one piece or not before it is

is put on to the compo., or before the compo. is run through the interstices as the case may be? I G. McCredie.  
could not say whether they do it in the way I have described or not, but that is the way in which I should  
do it to make a good faithful job of it. 19 June, 1896.

4049. You did not actually see them putting the grill in? No.

4050. Supposing it had been proved that it is done in this way—that the grill, although it cannot be made in one single piece, is made up into one piece by shorter lengths being lapped over and fastened with wire—suppose that the grill is laid on before there is any compo. put in at all, and that it is separated from the boards by little pieces of wood nailed on to keep it a proper distance out, and that then the compo. is put in by hand work through the grill, small hand-rammers being used to consolidate it—you cannot say that it is not done in that way, can you? That would not be as satisfactory a job as getting it set before the grill is put in, because the grill would then get a permanent level, whereas by ramming it in and out between the squares you might get it up here and down there. By putting in a layer of the compo. first you get a good surface upon which to lay the grill.

4051. How long would it take to set? Not long. They generally keep it from setting too quickly by wetting it.

4052. Would it set firmly enough to carry the grill;—how long would it take it to do that? By the time you got the work all over and smoothed up, it would carry the grill. We prefer to keep it wet as long as we can.

4053. *Mr. Parkes.*] Have you gone into the question as to what would be the stability of the arch if the iron were left out? I have not taken out any calculation of the strains of this kind of arch.

4054. Would you like to risk it? On the appearance of it I would not like to risk it.

4055. It all depends upon the fitting in of the iron? Yes; the iron constitutes the safety of the system.

4056. If it happened that from putting the iron in in pieces, it settled at any place sufficiently to cause a crack, what would be the result? The question is, of course, whether the iron will give or not.

4057. Supposing it does give? That, of course, would be a source of weakness.

4058. And once the arch were cracked what would become of the structure? It would be a weak arch if it were cracked. There is no doubt about that.

4059. There would be a danger to the structure you think? Yes.

4060. Supposing you were a builder, and you had to put up these Monier arches, would you be thoroughly satisfied with the prices you had put down for them? Perfectly satisfied. I would undertake to carry them out for the prices I had put down, and I am sure I should then make a profit of about 10 per cent.

4061. If, as an engineer, two plans were put before you—one the substituted plan in Contract 77 and the other the original design—which would you prefer to take, supposing the prices of the former were £250 below the other? £250 would not be a sufficient inducement. If I wanted to carry out work in connection with an aqueduct to carry water, and I had not sufficient money wherewith to build on the Departmental plan, I would certainly adopt the other plan upon the score of economy. There is no doubt as to its being cheaper. The Monier system carried out in its entirety is effectual enough for the work, but only on the score of great economy would I accept it as against the other plan. I do not think the difference between the prices you mention would be sufficient inducement for the adoption of the Monier in preference to the original design made out by the Department.

4062. Ordinary bridge construction is in brickwork with stone arches and concrete, is it not? Yes.

4063. And if the Monier work is 50 per cent. cheaper in bridge work, is there any reason why it should not be 50 per cent. cheaper in aqueduct work? I see no reason why it should not be just the same. It ought to be cheaper. Of course there is the channel to be considered, but that would not make such a big difference.

4064. As a matter of fact, is not a channel cheaper than a carrier? There is not much difference between them.

4065. Not when one is encased in concrete, and when the other is only 4 inches thick? Of course, a good deal depends upon the construction.

4066. Still, if the Monier work is 50 per cent. cheaper in bridge work, you are satisfied that it would be 50 per cent. cheaper in aqueduct work? Yes.

4067. And do not the figures you have made out show a difference of 50 per cent. between the two designs? Yes; there is no doubt about that.

4068. Suppose you as an engineer made out a design and called for tenders upon it, would you permit an officer of yours to make drawings with your knowledge to compete against the original drawing and then advise that a tender be accepted for a lump sum upon the substituted drawing without going into quantities to ascertain its real cost? It would be a most unusual course to adopt. I should not adopt it myself, nor would I allow anyone to adopt it in my office.

4069. If a substituted drawing were put in by a builder before you recommended a plan to your client, would you not endeavour to ascertain its exact cost? Certainly.

4070. And would you not take the trouble to take out the quantities in order to ascertain it? Yes.

4071. How long would it take you to take out the quantities in the case of the Monier arches? About three days altogether, I should say.

4072. Would not the aqueduct design in the case of Contract 112 be equally serviceable if it were employed in the case of No. 77? I should think so.

4073. It would be just as effectual for the purpose? Yes.

4074. Would it not be better if the work in the Monier arches were carried out with bluestone concrete instead of compo.? That is my opinion, because it is better than compo.

4075. Concrete is at any time better than compo.? Yes.

4076. *His Honor.*] Do I understand you to mean that you could work the concrete in with an iron grill in the arch as effectively as you could work in compo.? Yes; with a small gauge metal with special stone. As a matter of fact, in the Monier system they are doing it. They are putting a special concrete down outside the grill in the channel, and that works down in between the iron?

4077. On the side of the channel? Yes; in the aqueduct I looked at the other day some parts were finished and other parts were going on.

4077A. But I should say the difference between the two classes of work would be this—that in the case of the compo. there would be more continuous and complete adhesion to the iron than in the case of the concrete; for instance, wherever a piece of stone came into contact with the iron there would be no  
adhesion.

- G. McCredie.  
19 June, 1896.
- adhesion so far as that small piece went? There would be very little difference. I noticed the special bluestone stuff; it lies very close in the channel; in fact, you can see it sticking hard up against the iron.
4078. Practically you think it would come to the same thing? Yes; but of course special concrete would be more expensive than the compo.
4079. Would it set into a stronger mass finally apart from the iron? Yes, I think so. It is more like a solid mass than the compo. The compo. is more brittle.
4080. *Mr. Parkes.*] In the construction of any portion of this aqueduct is fine bluestone concrete used? Yes.
4081. And does it adhere to the iron? Yes; it goes against the side of the grill in the channel.
4082. *His Honor.*] You mean the vertical grill? Yes.
4083. *Mr. Parkes.*] When you were out at the works the other day I believe that the ends of the iron work which you formerly described as being rusty were cemented over? Yes; they were all covered with cement.
4084. Did you notice any other alterations as between your first and second visits? No great alterations had been made as far as I could see.
4085. Did you not notice some bolts? The bolts are all in for the plates that go across the joints; they are well protected; they have oiled rags round them.
4086. Did you notice them on the occasion of your first visit? They were not in on the first occasion.
4087. When you first went to the works you found the work generally being done in a great deal more careless fashion than on the occasion of your second visit? No, I could not say that. The work itself is well enough done. It is to the interests of the patentees of a new system to do really good work there. I should not say that the work was in any way done improperly.
4088. It is fairly good work? Yes.
4089. Where do the bolts which you have described go in in the drawings; can you point them out; I understand that bolts have been put in where holes had been left? The bolts were put in at the joints.
4090. *His Honor.*] I suppose the openings were to be filled in with mastic? Yes.
4091. *Mr. Parkes.*] Would not rust be likely to get into bolts put in after the concrete is set? The bolts are passed through the side of the channel.
4092. After the concrete has set? Yes.
4093. Therefore the rust could get to them? Yes, I daresay it could.
4094. The concrete being set would not preserve them? No; concrete will preserve iron.
4095. *His Honor.*] Are not their heads covered over by the rendering in some way? I do not know about that.
4096. *Mr. Parkes.*] The point is this, your Honor: if the bolts were put in after the concrete had set could they be coated with the concrete? Not very well.
4097. *His Honor.*] But if the heads are countersunk in the concrete on the inside they would be covered by the rendering? Yes.
4098. *Mr. Davis.*] You regard three years as being rather a short term for which to ask the contractors to guarantee this work? With a sixty years' life it does appear a small term.
4099. You think it would be more reasonable perhaps to ask for a ten years' guarantee? Ten years is a long time for a guarantee; I think about five years would be a fair thing.
4100. Supposing your firm were asked to take a risk, you would not take it without being paid for it? We don't generally take any risk under ordinary circumstances. The commission for the work we do covers all risk.
4101. Suppose you asked one of your contractors to take a risk of the description which Messrs. Carter, Gummow, & Co. had to take in connection with this Monier structure, would you regard it as a fair thing for them to include in their tender the price of that risk? If I were asking them to take a risk I should consider the price they submitted would cover it.
4102. With regard to the estimate which you made of the compo. used in these arches, and which you submitted to His Honor when you were here previously, what would you allow for shrinkage of the material after it had been made up? It is a 3 to 1 composition. I allowed 1 of cement to entirely disappear in 3 of sand. I think that is a sufficient margin.
4103. Supposing you were told that it had been found from actual experiment that the shrinkage was considerably more than that, would you be surprised? I would not believe it.
4104. You said just now that the Monier structure was no new thing? I do not say the Monier structure, as regards aqueduct work, is not a new thing; but the putting of a grid in cement is no new thing.
4105. Do you say that you used a grid similar to this in work which you did ten years ago? Yes.
4106. Do you remember what you said on the last occasion you were here? I do not know what you are referring to.
4107. You think, perhaps, that it might not exactly tally with what you are saying to-day? I do not not know. I will tell you when I look at my evidence.
4108. You said, in reply to Mr. Parkes, at Question 2700-2701:—"We engineers in this country have not had experience of the Monier system, because none of it has been carried out here." That is as regards the Monier system in connection with aqueducts. As I said a little while ago I do not regard the Monier system—that is, the putting of iron into cement, and there is really nothing more in it—as a patent at all, because I did that work myself long enough ago.
4109. The question is whether you regard the putting of this particular kind of grid into compo. work as anything special; have you used that kind of structure before, or have you seen it used? Not in connection with aqueducts.
4110. So that what you did ten years ago scarcely applies to the case in point? I do not know that. The principle involved is the same. It is simply the putting of iron into compo. to strengthen it. That is really what the Monier system consists of.
4111. How did you get the area of the carrier in the case of Contract 112? By co-ordinates.
4112. Do you remember the greatest width and the greatest depth of the carrier? I do not.
4113. With regard to the comparative estimates which you have made in the case of Contracts 77, 101, and 112, would you have His Honor conclude that the ratio of carrying capacity necessarily goes with the cost of an aqueduct? No. Of course a good deal depends upon the depth of the piers.

4114. *His Honor.*] But suppose you had the same depth in the piers, and that the works are similar in every other respect, you would not say that the cost varied directly as the capacity, would you? A good deal depends upon the structure. G. McCredie.  
19 June, 1886.

4115. *Mr. Davis.*] Suppose you had a carrier with an area of 20 square feet, and another carrier with an area of 4 square feet—suppose the carrier with 20 square feet cost £5 a foot—would it necessarily follow that the carrier with 4 square feet would cost £1 per foot? No.

4115½. So that your comparison between Contracts 77, 101, and 112, as regards area, is not conclusive? As regards area.

4116. Is it conclusive necessarily as regards cost;—what would you yourself deduce from your comparison? Do you mean comparing the prices?

4117. *His Honor.*] Have you worked out a comparison on the theory that carrying capacity and cost of two similar structures vary directly as one another? No. I have worked out the quantities to compare them per foot running as a guide to the work they do, and I have taken the area for comparison's sake.

4118. You worked each out on its own basis? Yes.

4119. *Mr. Gummow.*] As to Contract No. 77, you told us that you saw some iron rods sticking out of the concrete? Yes.

4120. Do you know how they were put in and when they were put in? No.

4121. Do you know whether they were put in before or after the concrete was set? The ends I saw sticking out must have been put in while the concrete was being put into position.

4122. As to the bolts going through the expansion joints, were they galvanised? No; they were covered with oiled rags.

4123. Coming to the question of the capacity of the sewers,—allowing that the running capacity of the two sewers is equal, do you consider that the cost ought to be equal;—would you think that the cost depends upon area and capacity? It depends entirely upon the construction.

4124. Take the book I have in my hand as an instance; if I hold the book in one position, that is horizontally, you have an area facing you of about 8 inches by 1½ inches;—would you consider that the cost of the construction of a sewer of that shape would be the same as the cost of the construction of a sewer in the shape of the same area, such as you see when the book is held vertically? It depends entirely upon the construction and the quantity of water carried.

4125. When you alter the shape of the sewer, do you not alter the cost? That is a matter of calculation.

4126. But does it not do so? I could not tell you unless I calculated it.

4127. Would not the pressure upon the sides in the one case be much greater? It would be greater.

4128. Then would not the cost be greater;—would you not have to allow for greater strength in the walls for the different pressure? Yes; it would be a fairly upright structure.

4129. In point of fact, then, an equal carrying capacity in two sewers does not prove that they would be of equal cost? As I have already said, you must consider with the capacity the mode of construction.

4130. Has the grade anything to do with the cost? That is an altogether different matter.

4131. Has the grade anything to do with the carrying capacity? Of course it has.

4132. *His Honor.*] I suppose the grade has a good deal to do with the form in which you build your sewer;—the greater the grade the more friction you may put up with? Yes; it depends also upon whether you render with cement or other materials: that has also to be calculated.

4133. *Mr. Gummow.*] Take a cask of cement;—what is its value? I should say as much as a man could get for it.

4134. Would you blame a contractor for asking 20s. a cask for cement if he could get it? I should not blame him, but I should blame the man who paid him that price.

4135. *His Honor.*] You would blame the contractor if he said the cement was worth that I suppose? Certainly.

4136. *Mr. Gummow.*] As to this aqueduct, do you not consider that the experience you would gain from other persons' risk would be a benefit to you? Certainly.

4137. If it proved whether it would be a good article for the future requirements of your clients, would not that experience be of some value to you? Yes, undoubtedly.

4138. It would be of advantage to your clients if it did turn out to be a good and cheap article? There is no doubt about that.

4139. With regard to the original design of Contract No. 77, does the stone-work assist in strengthening the work—I mean the sandstone ashlar? It certainly assists in a measure to strengthen the work, although it appears to be more in the nature of an ornament than anything else.

4140. Would you take it into your calculations of strength? Yes, I should have to do so, because it binds the work to some extent. These large stones working in as a string bind the structure.

4141. Does the extra dead weight, resulting from the presence of the stone, compensate for the extra strength it gives the work;—would you not consider that the extra dead weight would be rather a source of weakness than otherwise to the whole structure? I do not regard these stones as a necessary appendage to the aqueduct; I believe it would be quite strong enough without them.

4142. *His Honor.*] You think that on the whole they would be better left out except for the purposes of ornament? Yes.

4143. *Mr. Gummow.*] Do you consider that ashlar or bricks increase in strength with age; for instance, in five years are they stronger than when they are put in? I would not say that. They do not increase in strength with age.

4144. Does cement mortar increase in strength with age? That improves with age.

4145. Does it with age increase in strength, do you consider? Yes.

4146. When it was three years old, would it not in point of fact be stronger than when it was three months old? That will depend upon circumstances. It would depend upon how it stood in the three years.

4147. *His Honor.*] Suppose that at the end of three years it shows no sign of cracking? Well, when I was speaking of the guarantee, before I mentioned five years on account of the life-time of the sewer, I should say that if the work lasted well for from three to five years it ought to last well after that. Five years would be a fair test, I think.

4148. You say it took you three days to take out the quantities of this work? Yes.

4149. Do you consider that an ordinary quantity surveyor in the Department is as smart a man as you are? Just as smart as I am.

4150. With regard to the patent, are you in a position to give us a sound legal opinion? I cannot do that. I have given you only my own opinion. 4151.

- G. McCredie. 4151. You are familiar with the aqueduct portion of the Departmental plan of Contract 77? Yes.  
 4152. And you know the plan of Ahearne's contract 101? Yes.  
 19 June, 1896. 4153. They have different carrying capacities—but putting that out of the question, and comparing the two as modes of construction of aqueducts, what do you say as to their cost—for instance, is No. 77 in construction a saving upon No. 101 or is it not? I think the plan of Ahearne's contract is a saving upon the plan of No. 77. The cost in the case of No. 77 is £5 1s. 3d. per foot run, and in the case of Ahearne's contract the cost is £4 15s. 4d. per foot run.  
 4154. No. 77 plan then is more expensive than Ahearne's? Yes, according to the quantities I have taken out.  
 4155. Then it is not correct to say that as between the planning of No. 101 Contract and the planning of No. 77 Contract the Department have found out how to save money in planning, and have applied the saving to No. 77;—you say that it is rather the other way? Yes.  
 4156. You think they have found out how to make the work more ornamental? Yes. The design for the aqueduct at Johnstone's Creek and at White's Creek is a first-class design; it is an ornamental design. The brickwork and the stonework make it particularly ornamental. It is altogether a more extravagant design than that employed in the case of Ahearne's contract.  
 4157. There is not more waste of material in the spandrils in Ahearne's contract than in the other contract? No.

William Thompson recalled and further examined:—

- W. Thompson.  
 19 June, 1896. 4158. *Mr. Parkes.*] When you were last examined you had only completed your estimate in regard to one of the aqueducts in the Monier plan of Contract No. 77? Yes, at Johnstone's Creek.  
 4159. Since then you have completed an estimate in regard to both aqueducts upon the contract? Yes.  
 4160. You have also completed an estimate in regard to the original Departmental plan? Yes.  
 4161. You have been very careful to check your estimates? Yes; I have checked them very carefully.  
 4162. Could you guarantee them? To within a yard or two. I should not like absolutely to guarantee them. [*Vide Appendix No. 17.*]  
 4163. In your undertaking to the Institute of Architects have you not to guarantee your quantities? Yes; all lithographed quantities are guaranteed.  
 4164. Therefore you cannot afford to make mistakes? No.  
 4165. Do you ever make mistakes? Not that I am aware of.  
 4166. Take the Departmental design in Contract 77;—what do you make the value of the work? £10,072 19s., including the excavation and footings; that is, for the aqueducts.  
 4167. Will you tell his Honor what would be the cost of the Monier substitute? £6,230 11s.  
 4168. That is for the two aqueducts? Yes; there is a difference between the cost of the two designs of £3,842.  
 4169. Your estimate of £6,230 for the Monier arch design includes everything, as in the other case? Yes, everything in connection with the aqueduct.  
 4170. In addition to these estimates you have made out an estimate in regard to Contract 112, have you not? Yes, the aqueduct portion.  
 4171. How does it compare with your estimate in regard to the Departmental plan of Contract 77? The aqueduct in Contract 112 runs out £5 7s. 1½d. per foot as compared with £4 19s. 8½d. per foot in the case of the aqueduct in Contract 77.  
 4172. Have you not run out the quantities and the proportionate cost in regard to the work outside of the aqueducts? No; because in the one case there were two straining chambers.  
 4173. Going back to the estimate I asked you to make in regard to Contract 77, that is for the original departmental scheme for work outside of the aqueducts, what do you make it? I used the Departmental prices, taking 28½ per cent. off. My quantities I found were within a yard or two of the Government quantities, so I used the Government quantities.  
 4174. Taking 28½ per cent. off, what do you make the value? £6,629; that is the net value.  
 4175. Have you made a similar estimate in respect of the Monier plan? Yes; the two aqueducts come to £6,230 11s.  
 4176. There is not much difference between the piers? Yes; there is more stuff in the Monier piers than the others.  
 4177. To what extent? I know that there is a fair difference.  
 4178. Will you make out those quantities and let us have them on a future occasion? Yes.  
 4179. *His Honor.*] Although there are fewer piers in the Monier plan, they are so much larger that the aggregate is greater? Yes.  
 4180. *Mr. Parkes.*] You show the concrete in the quantities you have taken outside of the aqueducts? Yes; it would include the footings and the sewers and the retaining-walls.  
 4181. The difference that you make between the aqueducts in the two cases is £3,842, and that includes all the piers and foundations? Yes.  
 4182. That £3,842 is the difference after you have allowed for a fair percentage for builder's risk, profit, &c.? I have made them both out on working costs.  
 4183. The usual working costs? Yes.  
 4184. What is the percentage you have allowed on the working cost? I have not allowed any percentage on that; I have put it into the labour in each case.

Frank Moorehouse Gummow recalled and further examined:—

- F. M. Gummow.  
 19 June, 1896. 4185. *Mr. Andrews.*] You are one of the members of the firm of Carter, Gummow & Co.? Yes.  
 4186. At the time Mr. Hickson, jun., was engaged by the firm, you were carrying out a contract in Adelaide? Yes.  
 4187. Mr. Carter and Mr. Snodgrass were looking after the firm's contracts in New South Wales? Yes.  
 4188. You and Mr. Gillan were the only partners in South Australia? Yes; we were the resident partners there.  
 4189. Will you tell us what was the first you heard in regard to the connection of Mr. Hickson, jun., with the firm? It was in a letter from Mr. Carter to myself, telling me that he had engaged Mr. Hickson,

F. M.  
Gummow.  
19 June, 1896.

Hickson, jun., to assist me in Adelaide. I wrote back to him telling him that it was all right, and asking him to send Mr. Hickson on.

4190. At that time you were carrying out a rather difficult job in Adelaide? Yes.

4191. Was it necessary for the firm to have anyone there to assist you? Undoubtedly.

4192. You being a civil engineer? Yes.

4193. Had you received at that time any assistance from any other member of the firm? Yes, Mr. Snodgrass.

4194. Who also is a civil engineer? Yes.

4195. Had he to leave Adelaide? Yes; he had duties in Sydney.

4196. Did you ever receive a telegram from Mr. Carter in connection with Mr. Hickson, jun.? I believe I did.

4197. Will you tell us what was in the telegram? I am speaking from memory, and I cannot be certain of the words, but I think he wired to me to this effect—"that Mr. Hickson, jun., was leaving to come over to Adelaide." My recollection is that the wire was sent when Mr. Hickson was leaving, and after I had received Mr. Carter's letter. I could not speak definitely on the point, but I feel pretty sure that Mr. Carter did wire to me that Mr. Hickson was coming to Adelaide.

4198. Excepting that telegram, did you ever receive any other telegram about Mr. Hickson, junr.? I believe I received one other, about Christmas, 1893.

4199. After Mr. Hickson, junr., had left Adelaide? Yes; that is the only other telegram I can think of. It was to ask me if he could stay for another week in Sydney, where he had been for a holiday.

4200. Was Mr. Hickson, junr., ever a member of your firm? Never.

4201. Was there ever any intention on the part of the firm of making him a member? Never; not on my part, anyway.

4202. You heard Mr. Hickson, junr., tell His Honor on Wednesday what remuneration he received from the firm? Yes.

4203. Under all the circumstances, do you consider that a fair remuneration for a person carrying out the duties he had to discharge? Yes; I consider it a fair remuneration.

4204. It was not an excessive remuneration? No.

4205. Did you ever tell Mr. Gillan that you had received a telegram stating that Mr. Hickson, junr., was to be taken into the firm at any cost? Never.

4206. You yourself never saw such a telegram from anyone? Never.

4207. In connection with the correspondence between the members of the firm in Sydney and Adelaide by whom was it carried on? By Mr. Carter and myself.

4208. As far as you know was any correspondence carried on between Mr. Gillan and any member of the firm but Mr. Carter? Not that I know of, and I only remember Mr. Carter writing to Mr. Gillan on one occasion when he was in Sydney a few months ago. I remember saying to him, "I am too busy to write to Gillan my usual weekly budget. Scribble off a few lines to say that we are all well, and hoping that he also is going on all right." That is the only occasion on which he wrote to him to my knowledge. I was then sitting beside him at Forest Lodge.

4209. When Mr. Hickson was in Adelaide all the payments made to him were on account of his salary? Yes.

4210. Can you say whether he ever received any sum of money whatever from the firm except his salary—the money he was told he would receive for travelling expenses—and the two months salary in connection with his three months notice? No other money was ever received by him from the firm.

4211. You have checked all the accounts of the firm from the date of Mr. Hickson's entering your employment up to the time he left? Yes; and I am satisfied they are all correct.

4212. From those accounts you are positive that he never received any sum of money except those I have mentioned? I am positive. He was with me in Adelaide up to last June or the end of May, and he never received anything there except his salary. I think we paid him some expenses he incurred in coming to Adelaide from Sydney, but that is all. I am not sure whether I paid him the money, but I am sure he got it.

4213. Between yourself and Mr. Hickson was there ever any conversation as to his becoming a member of the firm? Yes.

4214. Will you tell His Honor what it was and where it took place? I can tell you the last one we had on the subject. He was often staying at my house in Adelaide, sometimes for a few days, sometimes for a night, and sometimes for an hour or two. We often talked about business and about all sorts of subjects. I can tell you the last conversation we had upon the matter to which you refer; that took place at Forest Lodge. With regard to the other conversations I always told him that I did not consider that there was any chance for a young fellow going into contracting either with our firm or with any other firm, and that if he could keep his position as an employee he would be far better off.

4215. May I take it that as far as you are concerned there was never any serious intention whatever of this young fellow becoming a member of the firm? Not the slightest.

4216. And he could not become a member without your knowledge? No.

4217. Did Mr. Hickson, senr., at any time whatever speak to you with regard to his son? Yes.

4218. About his becoming a member of the firm? No.

4219. Did he ever speak to you about his son being employed by the firm? Yes.

4220. When was that? When I came up from Adelaide I made it my business to call upon Mr. Hickson's father, and to tell him how his son was getting on. I did so as a matter of courtesy. I considered it my duty to inform him how his son was getting on, whether he was doing well or otherwise.

4221. Mr. Hickson, senr., never asked you to take his son into the firm or to give him employment? Never.

4222. But as you were in Sydney you saw his father and told him how his son, Mr. Hickson, junr., was getting on? Exactly.

4223. *Mr. Parkes.*] You say that you received a telegram from Mr. Carter about Mr. Hickson, junr.,—could you tell me the date of that telegram? I could not.

4224. Could you tell us the date approximately? It was about two or three days before he arrived in Adelaide the first time.

4225. It would be close to the date upon which the firm engaged him? Yes. I believe that Mr. Carter wired

F. M.  
Gummow.  
19 June, 1896.

wired to me that Mr. Hickson, junr., was leaving. That is my impression; I would not swear to it absolutely, but I am under the impression that Mr. Carter wired to me.

4226. Have you never had any conversation at all with Mr. Hickson, senr., about his son becoming a partner in the firm at any future time? No; but I will tell you what I said to Mr. Hickson, as nearly as I can recollect it. I called upon Mr. Hickson after I had been here a few days, and told him how his son was getting on.

4227. *His Honor.*] Did you see him on each occasion of your coming to Sydney? I came up three times in the three years.

4228. But when did this particular conversation you are about to refer to take place? I cannot remember. The conversation upon each occasion was upon the same points,—that is, as to how his son was getting on, how he did his work, whether he looked well, and general questions of that sort which a father would naturally ask about his son. I remember that on one of these occasions I said to his father that I did not see much prospect of his son getting on in the outside world as a contractor.

4229. *Mr. Parkes.*] What brought up that conversation? The conversation was brought up through my considering Mr. Hickson might have heard of the matters which I have already mentioned with regard to his son.

4230. When would that conversation be likely to take place? About eighteen months, I think, after Mr. Hickson, junr., had been in our employ. It was very similar to what I had already told the son—that I did not see much chance of a young fellow getting on as a contractor. I had spoken to the son upon the subject before, and I thought it probable that the son would send word to the father, and I told him all that I thought it right to tell him with regard to his son's connection with the firm.

4231. Did the father make any suggestion at all about his son going into partnership with the firm? Not the slightest. I merely said what I did in conversation to give the father information about his son.

4232. What did Mr. Hickson, senr., say in reply to your expression of opinion? I do not know that he said anything. I was really carrying on the conversation, and, as he was engaged at the time with his duties as Engineer-in-Chief, I did not wish to occupy his time. I told him how his son was getting on, and I then came away. I think I asked him if he had any message or parcel to send him, and that is all.

4233. Do you know whether Mr. Hickson, junr., made any application for employment in Western Australia before he left you? I do not know.

4234. How long after he gave you notice did he leave? He did not give us notice. We gave him notice. As I have said before, we had various conversations about his prospects. I remember his once asking me whether he was likely to be kept on, and I said, "Well, Hickson, you know as much about it as I do. If we do not get any contracts you will have to go. If we do get them we will keep you." We tendered for the adjoining contract to No 77, late in March, and we tendered late in March also for a railway deviation. If we had obtained either of those jobs Mr. Hickson, junr., would have been kept on, but we got neither. I remember him coming to me and saying, "No 118 is nearly finished, am I to go to the outfall?" I said, "No. The Government have adopted a system under which they do all the levelling themselves and there will be no need for you to be there. I can do what is required."

4235. Is it not a good arrangement for the contractors to have the Government doing all the work? On the contrary it is a bad arrangement; we prefer to do it ourselves.

4236. Would you not prefer it to be done at the State's expense? It does not save us very much expense. It saves us £5 a week sometimes, the cost of keeping on an engineer, but as members of the firm themselves are able to do the work, provided they have the time, it does not mean very much.

4237. Why did you not employ Mr. Hickson, junr., during the whole of the 3 months, seeing that you paid him for that period? We gave him notice on 1st April that his services would not be required after 3 months, and he came to me a fortnight later and said, "I think I am going to Western Australia." I said, "When do you think of going?" He replied, "Whenever you can let me. I should like to go as soon as I can." I said, "We have no objection. You can go whenever you like." He said, "I shall not be going for a fortnight. I suppose I can make arrangements, however, to pack up." I told him that he could, and he also said "I shall keep in touch with you all the time. I shall be still working for the firm. I can do anything you like; but I should like to have a day or two off." I said, "You can suit yourself. We do not want to stand in your light if you want to better yourself. We are pleased to hear that you are endeavouring to better yourself." About the end of April he came to us and said, "I am leaving my lodgings. Can you settle up with me?" I said "Certainly," Mr. Carter was there and drew out a cheque for three months' pay, Mr. Hickson did not ask for any particular sum and we merely gave him that amount considering that we had given him three months notice. We were quite willing to let him go if he could better himself. I do not know that we should have allowed him to walk round Sydney drawing our money; but as he thought of getting to Western Australia as quickly as he could in order to get on in life, we did not stand in his light.

4238. Had you not prospects of getting further contracts from the Government? We have now.

4239. But with a slight cessation of work you do not send your officers away? No, I could not say that; but we could see plainly the way work was cut, and, when a contract adjoining us, and which we thought we had such a big chance of getting, did not come to us, we thought it was of no use paying salaries to persons to walk about in the meantime.

4240. What was your percentage below the Government rates in the case of Contract 117? I am not sure whether it was 28 or 40.

4241. The contract was taken at 10 per cent. below Government prices? At 9 per cent. I think our tender was 28 per cent. or 40 per cent. above.

4242. *His Honor.*] You tendered above the schedule rates then? Yes; we were top; I know that; but I do not remember the percentage.

4243. *Mr. Andrews.*] Do you remember Mr. Gillan leaving Adelaide to come to Sydney about May, 1895? Yes.

4244. Did Mr. Hickson, junr., come to Sydney with him? No.

4245. Can you swear positively that on 27th May, 1895, Mr. Hickson, junr., was in Adelaide? He was in South Australia.

4246. He had not been away from South Australia from January of that year up to that date? No. I saw him every second day, if not every day.

4247. In no case was he away sufficiently long to enable him to come to Sydney? No.

4248. With regard to the last contract you have just spoken of you say that you tendered at 28 per cent. on? At some percentage on.

4249.

4249. Is it not a fact that the rates allowed in the Government schedule for that contract are very different from the rates allowed in the case of Contract 77? Yes.

4250. And that accounts for the difference so far as you are concerned? Yes.

4251. *Mr. Parkes.*] Is it not a fact that the rates allowed in the second contract are 100 per cent. below? Yes. In regard to some of the items.

4252. For instance the item excavation for tunnels is 120 per cent. below? I could not say without looking at the schedule.

4253. At all events the excavation, the concrete work, and all the large items are very much below? Yes.

4254. *His Honor.*] Was the excavation in that case in softer country? The rock might be softer, but the tenderer could not tell. There would not be a very great difference. The tunnel in country which is apparently the same will be at 40s. a yard forward, while the other would have cost 55s. It depends upon the lay of the country; the strata vary. The ground may be rising and falling.

4255. I believe the deeper you get into the sandstone the harder it is? Not necessarily. Sometimes the surface is the hardest, and the hardest country is not always the most difficult. The worst country is what is known as tough country. In some cases you can bore your holes, but it will not shoot properly.

4256. As to Mr. Hickson jun.'s ability to do work, what sort of a man was he? He was quite capable of doing any work with a theodolite or level which would be necessary on the Adelaide contract. He could take out quantities, make drawings, or do anything it was requisite to do for the carrying out of the work. I am an engineer myself, and he acted as my assistant.

4257. When you say that he was quite capable, do you mean that he exercised his capability;—you do not mean to draw a distinction between his being capable of doing a thing and his doing of it? Perhaps I had better explain the nature of his work. We had shafts 300 feet, 380 feet, and 500 feet down. We had to throw lines from the alignment on the surface. That was the most difficult work there was to do. They were about 9 feet apart. The wires were put down and were weighted at the bottom, and they were allowed to get steady. You then had to take the instrument down and put it on the same plane as the two wires; that necessitated very accurate work, and great pains had to be taken, and we had to do it on Sundays. We were sometimes working on Sundays from twelve to sixteen hours at it. I would do the work one Sunday and he would check it on the next Sunday. He would do the work on the following Sunday, and I would check it the following week, and so on. The Government in South Australia threw all the responsibility on our shoulders for the lines and levels, and they were continually writing to us to remind us of our responsibilities.

4258. *Mr. Parkes.*] That is the proper system is it not? I wish the Government would adopt it here. Before the South Australian Government will touch the work we have to do the alignments and levels. In some cases we had to expend two or three months at one shaft. They asked us what we made the reading then. We would compare notes and strike an average, and if they were not satisfied we would have to do it again and so on. It was a matter of trial and average.

4259. *His Honor.*] And you found Mr. Hickson junr.'s work in that relation good? Yes, thoroughly good.

4260. He was a man who did his work,—he did not loaf about? I will explain the nature of his work. He might have nothing to do for three or four days. We were not upon a contract where varying constructions were going on. It was the same old construction from week's end to week's end—continuous driving for months at a time. At times he might not have anything to do for a week. He could be spared for a week at a time, but on Sundays he would probably have to put in from twelve to sixteen hours, starting sometimes at 4 o'clock in the morning and knocking off at 8 o'clock at night. If Mr. Hickson wanted to get away for a couple of days to play a cricket match, or tennis, or anything of that kind, there was never any bother about it. If he were not required I would say "You can go and have your game of tennis or cricket." Of course he always let me know if he wanted to get away. Otherwise he was on the works every morning seeing what was required.

4261. When he went away to take part in a cricket match or anything of that kind was he up to time when he was wanted? Yes.

4262. So that it would not be correct to say that he loafed about taking photographs and doing nothing else? I think that referred to Forest Lodge and not to Adelaide. He did take some photographs at Forest Lodge, but he did all the instrument work there. I did not look through the instruments once there. He made measurements for all the workmen and all that kind of thing.

4263. Did he do it regularly? Yes.

4264. Steadily and properly? Yes.

4265. At intervals he may have been amusing himself by taking photographs? Yes, and we have a little pleasure ourselves when we go to cricket matches—sometimes for six or eight days in succession. At the same time we do not neglect our work if there is work to do. If any of our employees want to go away occasionally for a game they can go. We have no hard and fast rule in our engagements.

4266. *Mr. Smith.*] You always found, in regard to Mr. Hickson, jun., that when there was work to be done he was on the spot ready and willing to do it? Yes.

#### MONDAY, 22 JUNE, 1896.

John Carter recalled and further examined:—

4267. *Mr. Parkes.*] I suppose there is no doubt as to the correctness of your statement that your firm kept no books? That is correct.

4268. Did not some financial agent keep books for you? No.

4269. At no time? No.

4270. No accounts? No.

4271. You have never had your accounts audited? No.

4272. There is an amount repeated frequently in your pass-books, £52. 10s. for W. Manning;—who would that be? Sir W. Manning.

4273. Was that in connection with any financial work? It had nothing to do with our contracts or anything else of the kind—it was a purely private matter.

4274. Then there is a payment appearing in one of your books to Henry Rudolph? That is a purely private matter also.

F. M.  
Gumnow.

19 June, 1896.

J. Carter.

22 June, 1896.

4275.

- J. Carter.  
22 June, 1896.
4275. Was that a payment to an inspector? No.
4276. No books, you say, were kept other than these pass-books? No.
4277. You said you drew some of your cheques over the counter of the Bank of New Zealand? Yes.
4278. Had you no office at any time? No. We had temporary offices—boxes on the works. That is all.
4279. Did you keep no other books of any description to which you transferred amounts from the bank-books? No. We kept no books at all. I think that is very definite.
4280. Had you no private accounts to which you transferred moneys? Of course, I had my own private account at the Commercial Bank at North Shore. It was a small account for ordinary purposes—for household expenses, and so on; for nothing else.
4281. What are the red marks which appear in some of these passbooks? They are the bank's figures—the ledgerkeeper's figures.
4282. How were your partnership profits apportioned;—by your deed you had to divide your partnership profits for a certain period? I must say that that deed, so far as we are concerned, is so much waste paper, although it was drawn up by a very good firm of solicitors, Messrs. Minter and Simpson. I believe they put everything into it in the usual way. [*Vide Appendix No. 19*].
4283. You all signed the deed; it stands as a legal document? Yes; but we never acted up to it.
4284. Suppose one partner took action against another, it would stand as a legal document, would it not? Yes, I suppose so.
4285. It is in operation at the present day, is it not? No.
4286. When was it cancelled? When we paid Mr. Maddison and Mr. Ewing out of the firm.
4287. But this deed continued according to your notice to the public, did it not? Not that I am aware of. [*Vide Appendix No. 20*].
4288. Does not your notice to the public say so;—does it not say that the agreement so far as Maddison and Ewing are concerned is at an end, and that you would continue the business under the same style of Carter, Gummow, & Co.? Yes.
4289. Although the partners remaining at that time continued in the firm, you had no fresh deed of partnership? No.
4290. No fresh document was executed? No.
4291. The moneys in respect of Contract 77 were all paid into the firm of Carter, Gummow, & Co.? Yes.
4292. To what partners did those payments apply;—did they apply to the remainder of those enumerated in this deed? No; some had gone out. There are three less now. Mr. Snodgrass retired six months ago.
4293. The firm consists of the whole of the members mentioned in the deed with the exception of three? Yes; Mr. Snodgrass and Mr. Maddison and Mr. Ewing are not in the firm now.
4294. According to the payments made into your banking account the whole of the remaining members of the firm participate in the profits, if there be any profits? There is not any firm.
4295. Still this document would hold good supposing any of the partners were to take action? Only so far as the Adelaide contract is concerned. It is only in existence for the Adelaide contract.
4296. Only for that? That is all. That is my interpretation, but of course I may be wrong.
4297. Does not the deed refer to contracts proceeding in Sydney and Adelaide? I do not think so. I have not seen the document for some years. I have never had occasion to refer to it. We have had a rule-of-thumb way of doing business which might not have been quite correct, although it suited us.
4298. Is there no other partnership deed in existence besides this one;—is it not a fact that the whole of the members of the firm participate in the working of Contract 77? I wish it to be clearly understood that there is not any firm. You and I are arguing upon different lines. Four persons participate in any profits which may arise from Contract 77; but they are not a firm. There is not any firm in existence containing those four names.
4299. Is there any document cancelling this deed of partnership? No.
4300. *Mr. Gummow.*] As to this deed, you can tell by reading it whether it refers to any Sydney contracts or not? Yes. My impression is that it refers only to the Adelaide contract.
4301. Do you remember going to Johnson, Minter, and Simpson, after Mr. Maddison and Mr. Ewing had gone out of the partnership, with reference to a fresh deed of partnership? Yes.
4302. Whom did you see? Mr. Williams.
4303. Did we go into the question of a fresh deed of partnership between yourself, Mr. Snodgrass, Mr. Forrest, Mr. Gillan, and myself? We did.
4304. Was that deed ever carried out? It was not.
4305. *His Honor.*] I understand that there are four interested in Contract 77—that would be yourself, Mr. Gummow, Mr. Forrest, and Mr. Gillan? Yes.
4306. There is no deed of partnership binding you—you are in a position of co-contractors? Yes; we are what might be termed a contracting syndicate. The business is carried on merely upon those lines. There is no partnership.
4307. How used you to manage when profits had to be distributed at the end of a contract? I am glad of an opportunity to explain that. Our method of procedure in regard to contracts is this: We pay our wages fortnightly on temporary pay-sheets, and there is no signature or anything of that kind obtained from the men. Every month our measurements are made up by the Government. We do not even keep measurement books of our own. We have access to the Government books, and the measurements are made up by the Government engineer in conjunction with the contractor in charge of the work. The vouchers are paid on order by the Treasury. We never see them. Every month Mr. Gummow and myself, when he is here, and Mr. Snodgrass, when Mr. Gummow is not here, make out temporary balance-sheets to see how matters are going. We obtain our balance from the bank, noting what the Government owe us in the way of monthly progress payments. Outstanding accounts would be taken into consideration, and if a retiring partner wished to be paid up we should take our balance from the bank, credit or debit, as the case might be. We know from memory pretty well how much the Government owe us in the shape of deposit as security, and when we have paid the outstanding accounts of merchants and others a balance would be struck, and the resulting amount divided. That, shortly, is our method. If a contract was not completed we estimated the profits resulting from the balance of the work, and that was also taken into consideration.
4308. *Mr. Smith.*] You said just now that there were four persons interested in Contract 77? Yes.
4309. You, Mr. Gummow, Mr. Forrest, and Mr. Gillan? Yes.
4310. The original tender was signed by three persons, yourself, Mr. Gummow, and Mr. Snodgrass? Yes.
4311. That was on 13th March, 1895? Yes.

4312. The tender is signed Carter, Gummow, & Co., and it is also signed by yourself, by Mr. Gummow, and Mr. Snodgrass? Yes.
4313. Those names do not, owing to a mistake, occur in one of the printed papers? Yes.
4314. When did Mr. Snodgrass go out of the business? At the beginning of this year.
4315. When did Mr. Forrest and Mr. Gillan come in? They came in very soon after we had completed the contract.
4316. *Mr. Gummow.*] I understand you to say that our pay-sheets were all loose sheets? Yes.
4317. You do not know where they are at the present time? Not all of them.
4318. What is the reason of the change which has now been made as regards those pay-sheets? Well, a more methodical man in the person of yourself has taken charge of the contract. Another reason is that we are breaking in a son of Mr. Forrest to the contracting business, and we decided that it would be only fair to teach him a little more business method than we have hitherto followed ourselves. The pay-sheets are now bound up, but they are in other respects similar to those formerly issued.
4319. As a matter of fact, when I got them bound, what was your opinion? I looked upon it as a fad, and I made some joking comment upon it.
4320. *Mr. Parkes.*] Does not clause 1 of the deed of partnership say, "The said parties hereto will become and remain partners under the name, style, or firm of Carter, Gummow, & Co., of the trade or business of contractors, for the purposes of carrying out and completing the contract hereinbefore referred to, and any other contracts which the said parties shall mutually agree upon and shall obtain;"—there can be no doubt, I suppose, but that that covers all your contracts? Yes; but we must mutually agree. I could stand out or Mr. Gummow could stand out.
4321. But you mutually agreed upon Contract 77, did you not? Not under that deed.
4322. You have no other deed? We have no deed at all.
4323. This deed goes on to speak of contracts in the plural number all the way through? Possibly; but I cannot help that.
4324. *Mr. Gummow.*] You say that the deed refers to the Adelaide contract only? Yes.
4325. Is the Adelaide contract finished yet? No; we actually joined forces for the purpose of carrying out that particular contract. It was the first time that Carter, Gummow, & Co. came into existence.
4326. Did you ever carry out any other contract in Adelaide? Yes, we carried out the shafts contract.
4327. Had we a deed for that? No. I should explain that I have always regarded the two Adelaide jobs as one.
4328. Were they one? No; one was taken some considerable time after the other.

J. Carter.  
22 June, 1896.

William Thompson recalled and further examined:—

4329. *Mr. Parkes.*] You have now your estimates of quantities completed? Yes; I hand in the list. [*Vide Appendix No. 17.*]
4330. You make Contract 77 according to the departmental plan to represent £16,690, taking the whole of the work? Yes; that includes everything.
4331. You made an estimate of the value of the Monier plan in 77 Contract? Yes; I make it £12,850.
4332. There is a difference in value in favour of the Monier plan then of £3,840? Yes.
4333. You have made estimates comparing Contracts 77, 101, and 112, have you not? Yes.
4334. Will you tell His Honor what they are by the lineal foot? Yes.
4335. *His Honor.*] You mean as they go, as they actually run? Yes. My estimate for 101 is £5 9s. 1d. a foot lineal for one sewer; that is for the carriers and aqueducts portion; at the contract prices it comes out at £5 17s. 7½d. per foot lineal. In regard to 112 I estimate for one carrier £5 7s. 1½d. per foot lineal.
4336. *Mr. Parkes.*] What is your estimate in connection with 77? £3 1s. 8½d. per foot taking the Monier system, and taking the departmental plan £4 19s. 8½d. per foot lineal.
4337. Did you take out the area of the carriers in the case of 112, 77, and 101? Yes; the carrier in the case of 112 had an area of 41.24 feet, that is the total area; in the case of 101 of 28.27 feet; and in the case of 77 of 13.32 feet.
4338. Therefore the carrier in the case of 112 is more than three times in excess of the carrier in the case of 77, as regards area? Yes.
4339. Before we go any further into these figures, I want you to look at the tender forms of Contracts 112, 101, and 77; what, for instance, is the price set down for bluestone concrete, in the ordinary form, in the case of No. 77? £2 10s. a yard is set down for bluestone concrete in any situation. [*Vide Appendices Nos. 21, 22, and 12.*]
4340. What is it in the case of 101? 34s.
4341. In the case of 112, what is the price? £2 5s.
4342. So that the price in the case of 77 exceeds the other two, does it not? Yes.
4343. What is the price set down for special bluestone concrete in the case of No. 77;—I mean the schedule to the original plan? £3.
4344. What is the price of special bluestone concrete per yard in the case of 112? £2 15s., including the placing in position of the mastic plates and bars, damp course, &c.
4345. What is the price in the case of 77;—it is £3 without any iron, is it not? Yes.
4346. The material is of the same nature, as far as you can see? I think it is rather better in the case of 112, because it is 1, 1½, and 3.
4347. You mean better than in the case of 77? Yes.
4348. And yet it is set down at £2 15s.? Yes.
4349. Including all the ironwork? Yes.
4350. *His Honor.*] What is the composition of the special bluestone concrete in the case of No. 112? One of cement, one and a half of sand, and three of ¼-inch blue metal.
4351. *Mr. Parkes.*] Yet, including the ironwork, it is put down at 55s., as against 60s. in the case of Contract 77? Yes.
4352. What is the brickwork set down at in the case of 77? £2 10s. a yard in the Government schedule.
4353. What is the brickwork marked at in the case of 112? That is a different class of brickwork; it is set down at 35s.
4354. In the case of No. 101, Ahearne's contract, what is the brickwork marked at? 44s.
4355. What is cement facing marked at in the case of 112? 2s. per square yard.

W.  
Thompson.  
22 June, 1896.

4356.

- W. Thompson.  
22 June, 1896.
4356. And in the case of No. 77, what is it? 2s. 3d.  
 4357. Take freestone ashlar, what is that in the case of 112? 3s. per cubic foot.  
 4358. What is it in the case of 77? 3s. 6d. per cubic foot.  
 4359. Taking your own figures and the departmental figures in regard to the three designs—that is, the departmental design in the case of 77, the design of 101, and the design of 112—which is the most costly in proportion to its size? The departmental design of 77, certainly.  
 4360. For what reason? Because there is a good deal of ashlar masonry and double-pressed brickwork in it.  
 4361. It is a rich design? Yes, far more ornamental than the others.  
 4362. Taking the nature, quantity, and price of material, it exceeds the cost of 101 in proportion? Yes, proportionately.  
 4363. So that there can be no doubt that, seeing that it exceeds 101 in cost, and that the cost of 101 exceeds, according to your estimate, the cost of 112 by 2s. a foot lineal, it is impossible for the original departmental plan of Contract 77 to have been based upon the estimate taken out for 112? I did not go into the departmental estimates, I simply worked out my own.  
 4364. But there can be no doubt, can there, that the departmental plan of Contract 77 was not based, as regards work of the same nature, upon Contract 112? No; they apparently reduced their prices a little in the case of 112.  
 4365. Does not the cost of 77 exceed that of 112? Yes, as regards the schedule prices.  
 4366. Would it not be a fair thing, taking the relative estimates as regards 112 and 77, and seeing that in 112 the capacity of the carrier exceeds that in No. 77 by over three times, to divide the cost, viz., £5 7s. 1½d., by two? Well, 112 is rather lower; it does not go the same height as 77.  
 4367. But taking the relative cost of material? Yes, perhaps it would be fair; but I would not like to say off-hand.  
 4368. *His Honor.*] Can you form an idea as to how to reduce the cost of the bigger aqueduct to get at the cost of the smaller aqueduct? I do not know how you could do it. You would have to have the whole thing sketched out, and go into details.  
 4369. *Mr. Parkes.*] You could judge it pretty well, could you not, by the material in the two cases? Yes.  
 4370. The material in 112, as regards cost, is far below the material in 77? Yes; there is no doubt about that.  
 4371. And the capacity is three times that of 77? Yes.  
 4372. At the same time the cost of each is almost equal? Yes.  
 4373. The material is not much greater in proportion, although it is more expensive? Yes.  
 4374. Now that you have looked into the matter, will you tell His Honor how you arrive at your quantities of compo.? Yes. I have had prepared a statement, which I will now hand in, as regards the various items. As regards the compo. of 1 to 3, I have allowed 30s. per yard cube. According to Hurst's tables, and that is one of the standard authorities, 8·13 cubic feet of cement, 24·39 cubic feet of sand, and 37 gallons of water are equal to 1 yard cube of compo. I have taken 2½ casks of cement at 9s. 6d., making 19s. 9½d.; 25 cubic feet of sand, making 2s. 6d.; labour in mixing, 1s. 3d.; centres, 2s.; labour in placing, 4s. 5½d. A small mortar mill will mix 25 yards per diem, and I have allowed a man to deposit 1½ yards per diem, or 13 large barrow loads. As regards the centres I have allowed centering for 2 arches, and 80 feet lineal of channel. It comes out at about £99. I have allowed for the 990 yards of compo., at say 2s. per yard, under that heading. [*Vide Appendix No. 17*].  
 4375. So that as far as bluestone concrete goes you think the Government have put down an excessive cost for the compo.? Yes.  
 4376. You know as a quantity surveyor that bluestone concrete is a better material;—you have seen both materials tested? Yes; I have seen them tested. The bluestone concrete—I mean, of course, the small stuff—is much better.  
 4377. Is it less likely to shrink than compo.? I cannot say.  
 4378. *Mr. Davis.*] With reference to the shrinkage in the compo. what have you allowed, taking first of all the quantity of sand and the cubic feet of cement? I have taken it according to the table to which I have referred, and it comes altogether to 33 or 34 feet for the material.  
 4379. That means a shrinkage of how much? 6 or 7 feet.  
 4380. About 12 per cent.? Yes.  
 4381. I presume that if you were told that the actual shrinkage had been taken of material which had been used, and that it had been found to be three times the amount you named you would be a little bit surprised? It would be going against all the standard authorities.  
 4382. But you would be a bit surprised to hear that it was so;—I presume that what had been actually done on the ground with the materials that are being used would be nearer the mark than anything you could get from a book like Hurst's? Yes; the nature of the sand might vary slightly.  
 4383. So that that would upset your calculations a little? Yes, if you are correct.  
 4384. With reference to the centering, you say you allowed in your estimate for two centres, and for the boxing of 80 feet of carrier;—did you not see more centres than two being used? No, I did not.  
 4385. If the Department insisted on four sets of centres being used, and if the contractors have to provide those centres, I presume that it would be a fair thing to allow in the prices? Certainly. If they had to provide more centres, but there are only two actually there.  
 4386. As to the boxing, I believe you have had no actual experience in this kind of work? No.  
 4387. Supposing it were found to be a fact that the boxing would last only about four times—that is, that it could be set up only four times and would then have to be renewed, that would rather upset your calculations would it not? A little, perhaps.  
 4388. As to the labour you have included in your estimate, how did you arrive at that? Upon the assumption that a man would do so much in so much time.  
 4389. It is just an assumption on your part? Yes. No one in the Colony has had any experience in connection with compo. in this class of work.  
 4390. Supposing we have had practical experience in this class of work, and suppose that it has been found to cost more than you have allowed as far as labour is concerned, would not that upset your calculations again? Of course these things have to be tested.  
 4391. In your estimate of the Monier structure what foundations did you allow? I allowed for foundations down to the level shown on the drawing. 4392.

W.  
Thompson.  
22 June, 1896.

4392. Are there any foundations shown upon the Monier plan? No.
4393. Then any foundations which you have included are also a matter of pure assumption? No; I have gone down to the rock level as shown on the plan.
4394. Is it not a fact that you have assumed a level for the bottom of your piers? No; it is not an assumption, because the bottom is shown on the other drawing.
4395. The level of the rock is not shown underneath the piers in the Monier design? No.
4396. Then is it not an assumption on your part to give the levels of the bottom of the piers in the way you have done? No; I do not see that, because I have taken them from the other drawing which shows the rock level.
4397. In other words, you have transferred levels of rock which you have found in the departmental design on to the Monier design although the points where the rock is given do not correspond with the base of the piers at all; you say that it is not an assumption to draw a line of rock yourself? No, not altogether, because the rock is shown so clearly in the Departmental plan.
4398. As to Contract 112, I think you told His Honor that in that case there were three sewers? No; I said that in regard to Contract 101.
4399. From the estimate of comparative cost you have made as between 77, 101, and 112, do you wish His Honor to understand that it is possible to draw any conclusion from the making of an estimate of that description? No; I do not want His Honor to draw any conclusion. Mr. Parkes asked me to make these estimates, and I have made them.
4400. You know, as a matter of fact, that the shape of the sewer, the thickness and area of the brickwork, and the height of the carrier all have something to do with making up the cost per foot run? Yes.
4401. So that the price at one place for a comparatively large carrier might be less than the price at another place for a smaller carrier? Yes. I do not say that you can gauge the carriers and the relative cost at all.
4402. You have obtained certain quantities from Hurst, and I should like to know what quantity of water you propose to use in the compo,;—would the quantity put in have anything to do with the shrinkage;—would it affect it in any way? Yes.
4403. Do you know what quantity of water is being used in the compo. upon Contract 77? No.
4404. So that really you do not know what shrinkage to allow? The water does affect the shrinkage, of course. If the compo. has to be brought to a certain consistency a certain amount of water would have to be used.
4405. You do not know the consistency of the compo. that is being used? No.
4406. *Mr. Gummow.*] As to the number of centerings which are being used in connection with Contract 77, how many do you say were there when you visited the contract? I saw two in one aqueduct.
4407. Do you know if there were any more? I do not. I simply went by the first aqueduct I came to.
4408. As to the special bluestone concrete, I understood you to say that the ingredients were 7 of metal, 3 of sand, 2 of cement? Yes.
4409. Would you consider it a stronger construction than concrete—5 of metal, 3 of sand, and 2 of cement? No, certainly not; but in the case of 112 it was stronger than that.
4410. What were the ingredients in 112? 1, 1½, and 3, or 2, 3, and 6.
4411. Is that as strong as 2, 3, and 5? No.
4412. Which would be the stronger? 2, 3, and 5.
4413. *Mr. Parkes.*] You base your opinion as to office designs in Contract 77 being more costly in proportion to the others from the materials used and from the cost of them? Yes.
4414. *His Honor.*] Did you specially make a comparison between the cost of 101 and 77 for the purpose of trying to determine which was the more expensive of the two as a mode of construction? By the foot lineal; that is all.
4415. And you found, working it out in that way, that No. 77 was the more expensive? Yes, taking the capacities.
4416. Did you notice whether there had been any economy applied to construction in the case of 77 as compared with 101;—for instance, in reducing the size of the foundations, or in reducing the quantity of what might be called waste materials in the spandrils of the arches? No; I think 77 is a much more expensive design than 101.
4417. Can you explain what Mr. Hickson means, then, when he says that by the time the Department had arrived at No. 77 it had been found that the former plans were too heavy and expensive—that they were unnecessarily heavy and expensive—and that it had been found possible to economise in construction, partly by reducing the weight of the foundations, and partly by reducing the waste material in the haunches of the arches? No, I cannot. The sizes of the carriers are so different that it is hard to institute a comparison. One aqueduct is higher than the others.
4418. No. 77 is the higher? Yes.
4419. That would not affect the question of the arches and superstructure, it would only affect the piers and foundation? That is so.
4420. *Mr. Davis.*] Which would have the largest spandril, the arch as shown in the Government plan for Contract 77, or the segmental arch as shown in the case of 101? The arch in the case of 101 would have the largest spandril.
4421. *Mr. Parkes.*] Is not the building of an elliptical arch a great deal more costly than the building of a segmental arch? Yes; there is more trouble in getting the centres out.
4422. But is there not also more trouble in building after the centres are made? Yes; there is more trouble with the bricks.
4423. Is it not the most costly arch to build? Yes.
4424. *His Honor.*] I understand that the arches in the case of Contract 101 are segmental? Yes. [*Vide Appendices A. and C.*]
4425. And elliptical in the case of 77? Yes.
4426. *Mr. Parkes.*] Is there not more work and more material in the spandrils of the elliptical arches than in the spandrils of the segmental arches? There would be more material in the segmental arches, but I have not actually compared them.
4427. Take the striking of the arches on the piers in the segmental plan: compare the point at which the arch strikes there with the strike in the case of the elliptical plan? Yes; I confess I have not examined that point.

- W. Thompson.  
22 June, 1896.
4428. Is it not an acknowledged rule in construction that there is more work and more material in the spandril of an elliptical arch than in the spandrel of a segmental arch? There is more labour.  
 4429. Is there not more material? I do not know that there is more material.  
 4430. Take a semi-circular arch—is there not more material in the spandrel of the arch in that case? Yes.  
 4431. That is because the strike is lower? Yes.  
 4432. Would not the same rule therefore apply to an elliptical arch? The centre would strike lower.  
 4433. *Mr. Davis.*] In the case of 101, every sixth pier is an abutment pier twice the size of the rest? Yes.  
 4434. Go to Contract 77—are there any abutment piers? No.  
 4435. So that there would be a saving in abutment piers in design 77 as compared with the design of 101? Yes; but I have allowed extra to cover these.  
 4436. What is the span of the arch in the design of 101? 24 feet.  
 4437. What is the span in the case of No. 77? 52 ft. 3 in.  
 4438. So that there would be less piers in proportion in Contract 77 than in Contract 101? Yes.  
 4439. Taking the structure without regard to the material—taking it as it stands—do you not think that No. 77 is the cheaper design? Certainly; it is a lighter structure; but a more expensive one.  
 4440. *Mr. Parkes.*] But take it proportionately;—do not your own calculations show that there is more costly material in that design? Yes, proportionately.  
 4441. *Mr. Gummow.*] Taking the the brickwork in these three contracts, can you compare them at all in cost? No; the brickwork in No. 77 is more expensive than in the others. In the case of 101 the arches are simple brickwork, and in the case of 112 I do not think there is any brickwork at all, except under the carrier, and that would be much cheaper.  
 4442. It would be inferior brickwork? Yes.  
 4443. *Mr. Davis.*] Will the thickness of the arch have anything to do with the price? No.  
 4444. You mean to say that you could put in 4½-inch work in a tunnel for the same price as that at which you could build these big arches? Not for the same price.  
 4445. There is a lot of tunnel work in Contract 77;—there is a lot of 4½-inch brickwork in the tunnel, is there not? It is a small quantity compared with that in the aqueduct.  
 4446. But there would be a difference, and that would affect the price? 4½-inch work would be worth slightly more than 18-inch.  
 4447. *His Honor.*] The estimates you have handed in to-day go beyond the estimates you handed in on a former occasion? Yes; formerly my estimates went down to the footing line only.

---

James Mitchell sworn and examined:—

- J. Mitchell.  
22 June, 1896.
4448. *Mr. Parkes.*] You are a clerk in the Department of Audit? Yes.  
 4449. You hand in two documents from the Department, showing what? Payments on account of the contracts of Carter, Gummow, & Co. and Carter & Co.  
 4450. For what period? From 1890 to 1895. [*Vide Appendix No. 23.*]  
 4451. Do these payments include payments in funded stock? That I could not say.  
 4452. Will you ascertain and let us know on Wednesday? Yes.

---

Christian Herman Ohlfsen-Bagge recalled and further examined:—

- C. H. Ohlfsen-Bagge.  
22 June, 1896.
4453. *Mr. Parkes.*] You said the other day, in answer to one of my questions, that you informed Mr. Baltzer that Mr. Hickson wanted a Monier design;—did Mr. Hickson see you about it—did he speak to you about it? No, he did not.  
 4454. Who spoke to you about it? Am I bound to answer that question? I do not wish to cause any unpleasantness.  
 4455. I must ask you to tell us? I think it was Mr. Davis who spoke to me.  
 4456. What did he say to you? I think Mr. Hickson spoke to me also. I remember his saying, “Why do you not go in for more modern engineering?”  
 4457. I am referring now to the Monier arch design in Contract 77? Yes, but I think the conversation came in connection with the western outfall sewer in this way: I remember Mr. Hickson saying, “Why do you not go in for more modern engineering?” I said, “Well, Mr. Hickson, there are several modern modes of construction that have just come to light; but you must not forget that they are all specialities.” He answered, “That is all right; you get me some of the latest designs out; we must save all the money we can now. You had better get out three or four designs.” I think Mr. Davis afterwards came up and brought me a message to the effect that I was to get out a design for a Monier arch; and I then said to Mr. Baltzer, “Baltzer, Mr. Hickson wants a Monier design got out; you know all about it; now is your chance.” Baltzer said to me, “Yes, I know already; Mr. Hickson told me about it.”  
 4458-9. You said in your former evidence that you made calculations as to the strains on the arches at Johnstone’s Creek? Yes; no doubt, but only in connection with the original office design.  
 4460. When and where did you make up these strains? I remember at the time this matter of the western outfall sewer occurred saying to Baltzer, “If you make out a design on the Monier system you must make out calculations and show me that the system will be strong enough to hold itself up. I will not furnish Mr. Hickson with any design unless it is properly calculated.” I remember that we made out designs upon other systems also. I think there were four altogether. When Baltzer came to get out his calculations on the Monier system he found that he could not do it. I knew he would be unable to do it perfectly well, and he came to me and said, “Mr. Bagge, I find it exceedingly difficult to calculate these Monier arches. Will you let me have a good mathematician to help me?” I said, “You can have anyone you like.” He named a gentleman who is considered a good mathematician, and this gentleman went into the calculations with him. The mathematician afterwards came to me and said, “Mr. Baltzer can give me no starting-point, and unless I can get a proper starting-point I cannot calculate these arches.” He thereupon threw it up. Mr. Baltzer said to me afterwards, “Will you give me another good mathematician to help me?” I said, “You can have the whole office. Only prove that this thing will stand and I am satisfied. Show me your calculations.”

C.H. Ohlfsen-  
Bagge.  
22 June, 1896.

calculations." I gave him another gentleman to help him, and that gentleman said to me, "Mr. Bagge, the key of the position is not in our possession. Mr. Baltzer has not got it. He is very anxious to get it, but he has not got it. We can only get at the result in a very roundabout way. We cannot calculate the Monier arch. We shall have to take the compo. arch by itself and give the iron in. We cannot arrive at the connection between the concrete and the iron. We have no data—no constant. We cannot arrive at it. The only thing you can do will be to make the compo. arch so thick that it will hold itself." We then altered the original design of the real Monier arch, and made it thicker to answer our calculations. I look upon the construction of a compo. arch of this kind, even of the thickness given, as a ticklish piece of business, and for certain very good reasons I feel very doubtful as to whether it will stand.

4461. Were these plans and calculations made in office time? Yes; all in office time.

4462. And they were afterwards handed over to the contractors? No; they were handed to Mr. Hickson with my report.

4463. Was the plan you made of the Monier design, and which you handed to Mr. Hickson, made in office hours? Yes.

4464. If Messrs. Carter, Gummow, & Co. had not the true calculations upon which the Monier patent was obtained, the patent would not hold good, I suppose, if it were challenged;—I presume you know something about patents? It strikes me that that is altogether a point of law of which I do not profess to have any special knowledge. This patent was taken out without my knowledge. I had no idea at the time that it had been taken out, but Mr. Hickson knew of it. I know that Mr. Baltzer consulted him about it. Had I known of the patent being taken out at that time, I would have opposed it if I could.

4465. You have often had to use iron in concrete and compo. in your construction? We have used in various works iron bond-rods. You know the hoop-iron also that is used in building. We have never used ironwork as it is used in this special system, although, of course, the system was known to us as far back as 1888.

4466. Did you make out plans of M'Sweeney's Contract No. 112? Yes. The arch in that case is not a Monier arch.

4467. In that plan you introduce iron into your carriers? Yes.

4468. Do you think that that design is as effectual as the Monier system? No, I do not think it would be quite as effectual as the Monier system. The metal would have to lie closer. The arch is stouter than in the Monier system, and we put the iron in to prevent the concrete from cracking.

4469. In that case you estimated that the material in the concrete, including the ironwork, would run £2 15s. a yard? Yes. [*Vide Appendices Nos. 21 and 12.*]

4470. That is a great deal less than the iron and compo., which was valued in the case of the Monier plan at £4 10s.? Yes, but that price was set down on the supposition that the material and workmanship would be of the quality required for Monier work.

4471. Would it not have been much more economical to adopt a design such as that which you adopted in M'Sweeney's contract when you were designing the Johnstone's Creek aqueduct? It is very difficult to say. Johnstone's Creek is surrounded by valuable properties, whereas the western outfall, M'Sweeney's Contract, is not, and here we wanted to hand in a variety of designs as Mr. Hickson had ordered. Each design we tried to make as cheaply as we possibly could, consistently with the strength required. We did not exactly compare the cost of one with the other until we had them finished; then we drew out our results. The Monier design you speak of might have been cheaper; but you must not forget that we did not feel very safe about the Monier system pure and simple. That is why we got out these other designs.

4472. But you feel perfectly safe in regard to the design in 112? We felt safer in regard to that design than in regard to the Monier system pure and simple.

4473. It is certainly cheaper? I think my estimates bear that out.

4474. Was the design of Contract 112 built up upon any of the schemes contained in your report to Mr. Hickson? Yes; upon No. 2 scheme.

4475. But according to your estimate the material would be cheaper in the case of the Monier arch design? The material in the Monier arch design we estimated much higher.

4476. Is the design in 112 just as effectual as the Monier system? We thought it would be just as effectual.

4477. As a matter of fact, it has more responsible work to do? Yes.

4478. You thought you could construct it more easily than the Monier design? Yes; we could have completed one arch at a time, provided the necessary number of rigid centerings were placed in position.

4479. *His Honor.*] You were designing a scheme in concrete arches with which you were quite satisfied, without the use of the iron in the arch at all? Yes.

4480. Your plan is very much heavier in construction than is the Monier, is it not? Yes.

4481. And when you did not know how to calculate the strains in the case of using the iron grill, you thought it better to trust to concrete only, and work upon the basis of a sufficiently strong concrete structure to satisfy all possibilities? Yes; the calculations upon which the Monier system was based were not obtainable in the Colony.

4482. That construction, in your opinion, would be equally effectual with the Monier design? We thought it would be.

4483. *Mr. Parkes.*] Do you recollect an experiment which was made with the Monier patent in the case of a bridge on the Parramatta Road? There was a culvert built there.

4484. The saving in that case was supposed to be about 50 per cent., was it not? All I know about it is this: Mr. Davis came to me one day and said, "Mr. Hickson is building a culvert on the Parramatta Road." Mr. Hickson had told me before that there were no special difficulties in the Monier system, and that anyone could carry it out. He afterwards tried it in the case of this culvert on the Parramatta Road, and that was the culvert which Mr. Davis asked me if I would like to see. He drove me out there, and we saw the culvert. Some little time ago I heard that it had collapsed. [*Vide Appendix No. 10.*]

4485. Have you seen it since? I did not see the collapsed culvert, but someone told me that it had collapsed.

4486. Who told you? Is it necessary to say?

4487. Certainly;—I want to know who told you? I think it was Mr. Davis who told me. Mr. Davis apparently denies having done so; but my memory is quite clear on this point.

4488. You are sure Mr. Davis told you? Yes; I am quite certain he told me that this culvert had collapsed.

4489. For what reason would it collapse? When I first saw it I thought it was a safe culvert, but when I saw the masons doing their work in the way in which they were doing it, I felt fairly convinced that the thing would tumble down. They did not put in the mortar properly.

- C.H. Ohlfsen-  
Bagge.  
22 June, 1896.
4490. If there is a saving of 50 per cent. resulting from the using of the Monier system in a bridge, would there not be a similar saving from the use of the system in an aqueduct? Where does the saving come in if the system tumbles down?
4491. The real patent is in the arch, is it not? Yes.
4492. Then I say that if there is a saving of 50 per cent. in the arch of a bridge would there not be a similar saving in the arch of an aqueduct? Yes. Perhaps you will allow me to reply to that question in my own way. The trouble of building upon this Monier system makes it very hard upon a contractor. In the first place there are a lot of centerings to be built and boxed in. For the Monier design of No. 3 Scheme, Western Outfall, I reported that ten centerings would be required at a time.
4493. If he does the work properly? Yes. If he does the work properly the boxing has to be made water-tight, and that, as you can understand, involves a great amount of trouble and labour. There is great risk attaching to the work, because when you are using this fine cement if the water runs out it would take the cement with it, and that would cause a weak point at once; therefore if the work is to be done honestly it must be done with water-tight boxing from one end of the work to the other, and there may be a great expense connected with that.
4494. Upon calculations of that sort you made up your cost to £4 10s? Yes. But whether we were quite right in our calculations is another matter. We made them as nearly as we possibly could.
4495. Supposing there was a saving in the arches of the bridge from the use of this system, there would also be a saving in the arches of an aqueduct, I suppose;—is there any reason why this should not be? I think it is very difficult to calculate on the saving upon this Monier system as it is being carried out. It is entirely an experiment, and it is very doubtful whether there will be any saving at all. That is my honest opinion.
4496. *His Honor.*] But supposing that the work does stand, and that it does not tumble down? Then of course there might be a saving.
4497. *Mr. Parkes.*] And that saving would apply to both the cases I have named? Yes.
4498. I think you said just now that you took out quantities of the original office plans while Mr. Baltzer was taking out quantities of the Monier plan;—is that what I understood you to say? Quantities were taken out in the office of all the three plans together.
4499. So far as extravagance of material is concerned;—which is the most costly, the office plan of No. 77 or the plan of No. 101? I think the plan of No. 101 is the more costly.
4500. Has it not most expensive material? It is a stouter structure.
4501. But there is no dressed stonework in it, is there? No.
4502. Is there not dressed stonework in the office plan of No. 77? Yes.
4503. And the very best class of faced brickwork? Yes.
4504. Look again at the plan of No. 101 and tell me which you think is the more extravagant in material? I do not call the plan of No. 101 an extravagant plan.
4505. What would you call the plan of No. 77? I should call neither extravagant. Each plan has been calculated on its own merits and has been given the strength and material it ought to have.
4506. When No. 77 was taken out was there an economy in any special sense as compared with No. 2 scheme in your report—in other words did you base your material and work in No. 77 on the material and work in No. 2 scheme? I think they were all taken out as cheaply as possible, each on its own merits.
4507. But when you were calculating the work and material in the Departmental design of No. 77 did you take No. 2 scheme in your report as a basis? No. That is a totally different design.
4508. Is it more expensive or more economical? The design of No. 77 would be the more expensive of the two.
4509. How long after the plans of No. 112 were the plans of the Departmental design of No. 77 drawn? The plans of No. 77 were drawn some time ago with Ashlar piers; in fact, more expensive than the present plan of No. 77, the latter is a modification of the original design, less expensive, and this modified design was prepared prior to, but signed by me in January, 1895, and Contract 112 was nearly finished at that time.
4510. Seeing that you went into calculations with a view to cheapening the aqueducts, why did you depart from the method of construction in Contract 112 when you were designing Contract No. 77? Because Mr. Hickson told us that we must do more modern and cheaper work for Contract 112. Contract 77 is in a prominent locality.
4511. But when you were making the plans for the succeeding Contract 77, including the aqueducts at Johnstone's Creek and White's Creek, why you did not adhere to the cheaper form of construction? Because the locality of Contract 77 required a different design from that of No. 112, for which Mr. Hickson wanted three or four different designs taken out. We had to take out three or four different designs in order to comply with Mr. Hickson's instructions. [*Vide Appendix B.*]
4512. Is the design in No. 77 one of these? No; the brick arches were done before. Mr. Hickson wanted a cheaper design than the brick arches for No. 112. He wanted larger spans so as to cheapen the design.
4513. You drew the plans of No. 77 after the plans for No. 112 were drawn? I think before Contract 112.
4514. Then what I want to know is why you did not adhere to the cheap form of construction which you had adopted in 112? The site for No. 77 required a different design. You must understand that for No. 112 we had to take out three or four designs on the latest principles. We could not ascertain the cost of a given work until the design had been completed sufficiently to permit of quantities being taken out. After the actual quantities of the different designs were taken out, it was a matter of chance whether one of them was cheaper than the other.
4515. You mean you were waiting for the results of the plan in No. 112? Yes.
4516. Then was the Departmental plan in Contract No. 77 an experimental design? No; it is not an experimental design. It is a design such as would be carried out in Europe at that time.
4517. *His Honor.*] Do you say that the design of No. 77 involves a saving upon the principle adopted in the design of No. 101;—was it a cheaper kind of construction? No. If we had constructed a plan in the case of No. 101 upon that principle, it would have been more expensive.
4518. Then was the plan in No. 77 cheaper than in No. 101? No. All the ornamentation was taken away in the case of No. 101. The work was nearer the town in the case of No. 77, and when we started these works we were told not to put ugly sewers across the valleys. I remember that a large and very influential deputation waited upon Mr. Bruce Smith in those days, and they especially asked that ugly sewers should not be taken across the valleys. I remember pointing out at the time that we had no intention of constructing ugly sewers, and that we could make the work look as nice as any other public work.
- 4519.

4519. *His Honor.*] It was a deputation of mayors and aldermen, I suppose? Yes, and of members of Parliament, and a considerable time afterwards when the work was being carried out Mr. Hickson said that we must save as much as we could by the use of more modern and cheaper designs. These designs were accordingly taken out. I wish your Honor to understand that even the concrete arches in Contract 112 are quite a novelty. They are a ticklish thing to construct. That kind of design is even now being spoken of in the Home papers as a novelty. They constructed in Austria lately a large concrete bridge on a similar design, and they looked upon it as a great novelty. I say it is a ticklish work, because you must have watertight boxes, and great care must be taken as regards the material. It is work which should be allowed to be done only by specialists, as done in European countries.

C. H. Ohlfsen-  
Bagge.  
22 June, 1896.

4520. Then we come back to this—that as a mode of construction the design in Contract 77 is not cheaper than is the design in Contract 101? It is a totally different work.

4521. But whether the works are different or not, whether the difference comes in in the ornamentation or not, at any rate No. 77 is not a cheapening of the principle adopted in the case of No. 101. The design in No. 77 is in no way a cheapening of that principle? No. When we drew the modified present plan of No. 77 we took it out as cheaply as we could, but at the same time we wanted to give the work a good appearance.

4522. And did you in so carrying out your design modify the form of the arches—did you save anything in that plan of No. 77 in the arches as compared with the form of arch in No. 101? No, we did not; it might have been cheaper had it been a different style of work. At the same time the modified design for No. 77 is a very cheap design.

4523. If it were not for the ornamentation? Yes. [*Vide Appendices A and C.*]

4524. But with the ornamentation it is about the same you think? Yes, without the ornamentation it would be still cheaper.

4525. For its carrying capacity? Yes.

4526. *Mr. Davis.*] I should like you to be quite clear which design you signed first. You told us that the design of No. 77 was signed in January, and that the design of 112 was signed, as I understood you to say, later, in which case the design in Contract 77 would be in hand before the design in the case of Contract 112? Yes.

4527. Therefore the estimate that you put before Mr. Hickson when the design for No. 112 was about to be proceeded with had no reference to Contract 77? Certainly not, it only referred to No. 112. Every estimate was made entirely on its own merits. A special estimate for No. 77 was made and handed to Mr. Hickson at the time when that plan was laid before him.

4528. I should like you also to clear up the point as to the cheapness or otherwise of the design in contract No. 77 as compared with the design for Contract 101. Without reference to the material what do you think is the cheaper design? As far as the design is concerned the design for Contract 101 is the plainer and cheaper style of design.

4529. Leaving the material out of the question, and taking the big spans and the smaller piers in No. 77 as compared with the smaller spans and the big abutment piers in the plan of Contract 101, which would you say was the cheaper design? The plan of No. 77 might appear cheaper, but you must allow me to explain matters. You must recollect this, that when we designed the aqueducts for Contract No. 101 we were going over very peculiar and low ground, and by having the spans as you see them we distributed the weight of the heavy structure upon a greater number of piers and smaller arches in consequence. In the case of 77 we did not run as much risk as we did in the case of No. 101, which contract is on very bad ground. In the case of No. 101, on that low ground, we were afraid that with the larger arches settlement would take place much more readily than if the piers were closer together. As a rule, the greater the elevation of an aqueduct above the ground the greater the span of the arches.

4530. Assuming that the foundations were similar, and that the material in the two structures was similar, which would be the cheaper to build, the arches of the span which you have in No. 77 or the arches of the span which you have in No. 101? The two designs are necessarily quite different in style. I think the arches in No. 77, where practicable, would have been cheaper, but you must bear in mind that the two structures were on very different ground. It is of no use to ask me questions, irrespective of the ground for which the structures were designed.

4531. Coming now to the material. In the case of the design of Contract No. 77, I think you said that the material specified to be used in that case was more expensive than in the case of Contract No. 101? Only on account of the appearance which had to be given to the work.

4532. That was the reason for the difference you made in respect to the material in the design for Contract 77 as compared with design for Contract 101? Yes.

4533. Before we leave that subject, I should like you to explain what you meant by that foot-note to your report? The question arose as to the actual expense of these works. Mr. Hickson wanted us to do the work more cheaply. We had to consider that in the case of the one work two sewers would answer the purpose for a long time, the third being built some twelve or fifteen years hence. I, therefore, said in my footnote with reference to that work—I mean Contract 101—that Ahearne's plan was not so expensive as Mr. Hickson thought, and that if we only did the work actually required it would come to the amount I gave, leaving out the one sewer. [*Vide Appendix No. 9.*]

4534. You wanted to show first of all that the work which had been carried out in the case of No. 101 was not so extravagant after all? Yes.

4535. Secondly, that in the work you proposed to carry out in conformity with Mr. Hickson's wishes there was a saving representing the difference between £10 16s. 1d. and £6 16s. 11d.? Yes, and that for a much larger aqueduct.

4536. When you made these relative estimates what consideration did you give to the foundations. Did you assume that there would be the same foundations in each scheme? In these three schemes—certainly. They were all for one and the same thing.

4537. *His Honor.*] But did they involve the same foundations as in the case of Contract 101? Contract 101 was totally different from these three schemes. There were three different schemes for the same purpose, and they were on the same ground. Contract No. 101 is on quite different ground.

4538. *Mr. Davis.*] What you say is that you included in the three schemes you submitted the same foundations? Yes.

4539. How did the foundations which you included in No. 3 scheme compare with the foundations included in Contract 101? There is no relation between the two things.

4540.

C. H. Ohlfsen-  
Bagge.  
22 June, 1896

4540. So that it would not do to rely too much upon the comparison you made in your footnote? Not at all. I brought in the footnote to show that Contract 101 was not so much more expensive than the three estimates of the three rival schemes.
4541. What foundations did you include in the £10 16s. 1d.—did that amount include all the foundations which were put in or which were to be put in under Contract No. 101? According to contract schedule and prices.
4542. So that as far as the foundations are concerned the three schemes compare with the price in No. 101, £10 16s. 1d.? Yes.
4543. You were saying just now that the Monier design, which you now see on the easel, was made by Mr. Baltzer during office hours;—did you refer to the plan upon the easel, or did you refer to the design which was made at the time you wrote your report? The design referred to in my report was made by Mr. Baltzer in the office.
4544. Was it made during office hours? Yes, decidedly.
4545. You are quite sure about that? Yes; I am as sure as that I stand here that the plans were made in the office by Mr. Baltzer.
4546. Are you sure you have not confused the plan for the Johnstone's Creek aqueduct with the plan that was prepared in the case of No. 112 and which you submitted to Mr. Hickson with your report? I am referring to the plan mentioned in my report. Johnstone's Creek plan was also made by Mr. Baltzer, and I believe in the office.
4547. Do you mean the Monier design? Yes.
4548. Is it not a fact that the Monier design is similar in every respect to the design made by Mr. Baltzer at the time you submitted your report in connection with Contract 112? The plan you have pointed out to me is not a design for Contract 112. There does not appear to be any heading to the plan.
4549. I want you to be quite sure upon this point;—are you sure that this particular drawing was made by Mr. Baltzer during office hours? All I know is this, that Mr. Baltzer made a design for the Johnstone's Creek aqueduct, on the Monier system, and I believe in office hours. Whether the drawing before me is that identical drawing, or a copy of it, of course I cannot say.
4550. The design to which you refer was sent down to Mr. Hickson with your report? Yes.
4551. And that is the design to which you referred when you said, "Now, Baltzer, here is your chance"? Yes. I said to Baltzer, "Mr. Hickson wants three or four more designs, and he wants a Monier design. Here is your chance. You say you are an expert. Make a proper design, but be sure that it is calculated properly." [*Vide Appendix B.*]
4552. Is not the tracing before you, to which you have been referring, the plan which went down with your report to Mr. Hickson? It may, or may not, be; I cannot say. I should very much like to see the original.
4553. [*His Honor.*] When you sent down your report on the three schemes to Mr. Hickson you sent plans with it? Yes.
4554. [*Mr. Davis.*] But at that time the plan for the Johnstone's Creek aqueduct was not signed? I do not know about the date. I know that the Johnstone's Creek aqueduct plan, to which I am referring, was drawn by Mr. Baltzer, and I believe it was drawn in the office.
4555. But were these three concrete schemes made out with the idea of utilising them upon Johnstone's Creek and White's Creek;—were they not made out for another purpose? I recollect three different designs were made out at the one time, and that the Monier design was made out by Mr. Baltzer. The other designs were made out by us according to our ideas.
4556. Is not the tracing you have been referring to, and which Mr. Baltzer made, the design which was sent down to Mr. Hickson for his decision? I am under the impression that four designs were made out. There are only three here.
4557. Is not this tracing the drawing which you have referred to as having been made by Mr. Baltzer during office hours? Well, it is extremely difficult to distinguish one sheet from another.
4558. Was not the plan which Mr. Baltzer made during office hours the one which you sent down to Mr. Hickson with your report? Certainly.
4559. Did you, as far as you can remember, ever compare the cost of Contract 77 with the cost of Contract 112, Contract 77 being for the Johnstone's Creek aqueduct and Contract 112 being M'Sweeney's contract, seeing that these designs were made before Contract 112 was thought of;—how could you possibly compare the one with the other? The Johnstone's Creek aqueduct had nothing whatever to do with the three schemes contained in my report.
4560. What I want to know is, whether the Johnstone's Creek aqueduct plan had anything whatever to do with M'Sweeney's contract, taking the sewer across the sewage farm at Arncliffe? No; except that Mr. Hickson referred to it as a more extravagant work, and said that we must do cheaper work.
4561. When Mr. Hickson said that he did not refer to Contract 101? It is very difficult for me to understand what you mean. What I understood him to say was that the work referred to in my report must be done more cheaply with larger arches. I remember perfectly well what took place at the time, but your memory seems to have gone.
4562. At the time you submitted your report upon the extension of the sewer across the sewage farm at Arncliffe; you also submitted a sheet of strains? Yes.
4563. Can you identify the sheet I now hand in as being that sheet? Yes.
4564. Does it bear your signature? Yes.
4565. After this sheet had been prepared under your own superintendence, were you not satisfied that the 75-foot span arch at Arncliffe was not only stable but was absolutely sure? Yes; you are referring to M'Sweeney's contract. The calculations are quite correct, but the work is a speciality nevertheless.
4566. Did you not say in your report, "Scheme No. 3 is accompanied by one sheet of drawings showing the proposed general design, and by a second sheet of drawing showing diagrams of forces on the 75-foot span arches loaded and not loaded, and on the 7 ft. 3 in. arches loaded only." You go on to say that there is a factor of safety of 5·7, and that you regarded that as conclusive in your own mind as to the stability of the arch? I regarded the calculation as absolutely conclusive. It was the result of the best calculations we could make on the subject, but the work remains a speciality.
4567. Is it not a fact that the calculations shown on this diagram of forces were made without taking into consideration the iron grid in any way whatever? Exactly.
4568. You treated the arch simply as an ordinary arch composed of compo.? Yes. 4569.

4569. And it gave a factor of safety of 5·7? I ought to make this explanation: Originally we had made the arch lighter, but when we went into calculations we found that we could not make any in regard to ironwork; therefore, we made the arch sufficiently strong to hold itself. I warned you in my report that it was a concrete arch, pure and simple, and that both it and the Monier were specialities at home, and that the danger which rested with the one rested with the other. I warned you distinctly that it was a novelty, and I feel almost sure that if the iron were omitted from the compo., although the strain shows that the structure will stand, it would not be well to take the risk. I myself would not like to take the risk of the arch unless it were built by specialists. C. H. Ohlfsen-  
Bagge.  
22 June, 1896.
4570. Then you regard this diagram of forces as unreliable? It is correct.
4571. Therefore, the arch should be stable if properly built? Yes; but I would not take the risk.
4572. With the iron grid it would be even more secure? Yes.
4573. Supposing you increased the thickness of the arch from 10 inches to 12 inches, would it not be even stronger? I would not build it of compo.
4574. But would it not be stronger? Yes.
4575. So that if the arch at Johnstone's Creek, which has not to carry the same weight as the arch which you propose at Arncliffe, is made 2 inches thicker, it will be 20 per cent. stronger; and you would say, therefore, that the design was safer than the one you proposed? I would simply say this—that according to calculation this plan is correct, but in practice I believe that if you carry out the work without the iron it will tumble down. There is no engineer here who can supervise it properly. It is a speciality, pure and simple.
4576. Do you remember when I told you, as you state, that the culvert had fallen down at Strathfield;—when was it? Some time afterwards. It might be a few weeks afterwards. You took me out to show me the place, and you afterwards said, "You know that culvert? It has tumbled down."
4577. You cannot remember where it was that I told you that? In the office.
4578. You are quite sure about that? I am as sure of it as that I stand here.
4579. Did I ever tell you, or did you ever hear from anyone, that a week after the arch of the culvert had been constructed, by some mistake on the part of the watchman, one of those waggons which come down from the country laden with produce and weighing about 10 tons was allowed to cross it, and that the arch did not move a peg? No; no one ever told me of that. It is the first time I have heard it.
4580. *Mr. Gummow.*] What is the date of your report to Mr. Hickson? 22nd September, 1894.
4581. What is the date of the acceptance of the tender for Contract 77? 13th March, 1895.
4582. With regard to this Parramatta Road culvert, you say it was badly constructed? I did not say anything of the kind.
4583. Did you not say something about bad construction? Mr. Davis, to the best of my recollection, came to me and said, "Mr. Hickson is building a culvert on the Parramatta Road. Would you like to see it?" I said, "Yes." We went out, and I saw it being constructed, and I saw the men who were at it using their tools in a very peculiar way, putting the compo. in in a way that I did not like—very different from the way in which I have seen you putting in the compo. in your model arch when it was built at North Shore. I saw then at once that it would never do to hand this kind of structure to anyone who came along, and offered to do it.
4584. Did Carter, Gummow, & Co. build the culvert? I do not think so. I think it was built under Mr. Hickson by one of the road engineers.
4585. If these Monier arches are built with watertight boxes, I understand you to say that you consider they would be all right—is that not so? That is one factor in their construction.
4586. With regard to the bad foundation in Contract 101, as compared with the bad foundation in Contract 77, which has the worse foundation? I think Contract 101.
4587. When you get a bad foundation, what means do you generally take to strengthen the structure? First of all, we make the arches narrower, and then we pile. Every pier is piled.
4588. Has any pier in the case of Contract 101 been piled—have piles been put in to support the piers? I think I made provision for piling in bad ground.
4589. If it were necessary? Yes.
4590. Have any piles been put into the foundations of Contract 77; and, if so, was any provision made for them? I could not say. The plan will show.
4591. Did you allow for piles in that contract? Yes.
4592. With regard to the three schemes upon which you reported—you say that Mr. Hickson told you that you must be more modern in the designs you got out;—you got out these schemes in order to be in touch with what was being done on the Continent? Yes.
4593. You said you considered these concrete arches a novelty? Yes.
4594. Do you consider the Monier arches a novelty? Yes; quite a novelty. A speciality.
4595. In connection with this contract for concrete arches, did you make any extra provision for security other than the usual deposit and retention money;—was there any guarantee bond? I could not say.
4596. You do not know whether the Government have made the contractors find security bonds as well as give retention money? I do not. I stated in my reports that for concrete arches as well as arches built upon the Monier system the European Governments asked for securities.
4597. You do not know whether the Government in this particular case asked for any special securities? No.
4598. I am referring to the design in Contract 112;—it is as much a novelty as the Monier system as far as you know? Yes.
4599. Do you know Mr. Snodgrass? Yes.
4600. Have you had much to do with him in general practical engineering? I have known Mr. Snodgrass for fifteen years, and I consider him a clever man; in fact, I think he is one of the cleverest men in your firm. I know you are a good man too, but I looked upon Mr. Snodgrass as a clever man, a good mathematician, and a man having at the same time a lot of practical experience.
4601. Do you know the main outfall chamber at Bondi? Yes.
4602. Would Mr. Snodgrass be quite capable of carrying out that work? I think so.
4603. Could I do it? I am sure you could. You did it.
4604. *Mr. Parkes.*] I should like to settle this question with regard to the plans. The first report you sent to Mr. Hickson was six or seven months before plans were made for the Johnstone's Creek and White's Creek aqueducts;—what I want to know is whether, when you were making plans for Contract 77, Mr. Baltzer was making a plan for the Monier arches? No; Mr. Baltzer made the plan for the Monier arches when we made the plans of the three rival schemes. 4605.

- C. H. Ohlfsen- 4605. You wrote a letter following your report, when tenders had come in for the Johnstone's Creek and  
 Bagge. White's Creek aqueducts, and then said: "The plans for the White's Creek and Johnstone's Creek aqueducts, as designed in this office, for which tenders were invited, were prepared with a view of securing the most substantial and enduring structure at the most reasonable cost. At the time that this design was made I had as full particulars regarding the Monier principle as it was possible to obtain in the Colony." Accompanying this letter or second report of yours, was the contractors' Monier design;—what I want to know is, was that contractors' Monier design made by Mr. Baltzer? Yes.
- 22 June, 1896. 4606. In the office? Yes, to the best of my belief. At least, I am under the impression that I saw him making a design there for this very thing.
4607. At that time? Yes.
4608. And were the original designs made at that time? Yes, the original design, as modified, was made in the office.
4609. The plan which Mr. Baltzer prepared would I suppose be a plan in addition to this tracing? Well, it was made on white paper like the plan before me.
4610. *Mr. Davis.*] Do you know whether Mr. Baltzer prepared two designs on the Monier system? It is very difficult for me to say, but I know that two designs were made. He made sketches first, and afterwards made the designs.
- 4610½. And that design was you say the design which you submitted to Mr. Hickson with your report? Exactly.
4611. When you submitted the tenders to Mr. Hickson in connection with Contract 77 you wrote what Mr. Parkes has read to you? Yes.
4612. You say in that report or letter, "At the time that this design was made I had as full particulars regarding the Monier principle as it was possible to obtain in the Colony"—did you refer to the design which you had submitted to Mr. Hickson before that date? The portion of the report which you have read referred to the design which Baltzer made in connection with the Johnstone's Creek aqueduct. I am sure of that.
4613. And you say he made only one design? That I cannot say, but two Monier designs were made in the office. I know that he made the design I asked him to make for the three rival schemes.
4614. It is quite clear that Mr. Baltzer drew the Monier arch plan which you submitted with your report on the 21st September, 1894? Yes.
4615. Now I want you to be very careful in what you say, because it is a serious matter. I want you to tell His Honor whether you know of Mr. Baltzer drawing any other design during office hours? He made several designs in the office. I am quite sure of that.
4616. Can you swear that Mr. Baltzer drew this design of the Johnstone's Creek and White's Creek aqueduct in the office? I would much rather that you did not ask me these questions. I have not seen the plans for a long time now, and they confuse me. I can only say to the best of my belief, Baltzer did draw the plan. I may be in error. The plan you have put before me looks to me uncommonly like the plan which I saw at that time. Now I come to think of it, I should not like to say whether that was done in the office or not. But I know two Monier designs were made in the office.
4617. *His Honor.*] You remember having a number of tenders laid before you in connection with the carrying out of Contract 77? Yes.
4618. You then made a report, or you may say you wrote a letter? Yes.
4619. A copy of that letter appears in the Parliamentary papers under date of 14th March, 1895? Yes.
4620. At the end of the list of tenders which you submitted with that letter you put the tender of Carter, Gummow, & Co., for a lump sum of £15,500? Yes.
4621. That was for carrying out the work upon the Monier principle? Yes.
4622. At that time did you see a plan or plans accompanying the tender for that particular work? I certainly did, and I know that a second design was made in the office.
4623. But the design to which you are now referring was for an aqueduct which really was to be built in a totally different place,—not at Johnstone's Creek or White's Creek? Yes, possibly.
4624. It might have been utilised for M'Sweeney's contract; but instead of utilising it for M'Sweeney's contract your No. 2 scheme was utilised? Yes, possibly.
4625. And it was as to the tracing to which you have referred that you calculated out the strains on the Monier system, leaving out the iron? Yes; the strain calculations refer to the three rival schemes.
4626. When this lump sum tender was before you for £15,500 as a substitute for the office scheme in the case of Contract 77, did you see any plan at all? Yes, I did. It came to me with the tenders for Contract No. 77, and at that time I was under the impression that it had been made in the office. It is Mr. Baltzer's drawing, but I may be in error as to his having prepared it in the office.
4627. That being so do you really know anything about the drawing of the plan;—do you know who drew it and where it was drawn? Yes, it is Mr. Baltzer's drawing; but, now I come to think of it, I should like to withdraw that part of my evidence as to where this plan was drawn, because I would not like to injure anyone. At the same time, I have a feeling that it was drawn in the office; but I do not want to injure anyone, so perhaps I had better not say anything definite about it.
4628. You are not sure about it? No; you must recollect that this took place some sixteen months ago.
4629. *Mr. Davis.*] At the time you received tenders for Contract 77 you had charge of the drawing office? Yes.
4630. You were personally acquainted with all that went on there? Yes.
4631. And you were responsible to the Government for seeing that every man there did his duty? Yes.
4632. Do you think it would be like yourself to allow a draftsman in the office to occupy his time on his private business or work? I do not look upon it in that light at all. When Mr. Hickson wanted a certain design we had to make it.
4633. You are referring to the design which you sent in with your report? Yes.
4634. I want you to fix your mind upon this—when you received tenders for Contract 77 is it likely that you would allow Mr. Baltzer or anyone else in the office to occupy his time in drawing another design? Not unless I told him to do so.
4635. You would not be likely to tell him? If I were instructed by Mr. Hickson that a design was wanted I should certainly tell him.
4636. Would he be likely to so instruct you;—is it at all likely that he would instruct you to do work for Carter, Gummow, & Co.? I could not take that into consideration at all. If Mr. Hickson wanted a certain design I should not ask anything of Carter, Gummow, & Co. I should not ask them to permit me to make the design. That has nothing to do with it.
- 4637.

4637. You say that Mr. Hickson asked you to make a design on the Monier system? Yes.
4638. Is not the tracing before you the design you made? Yes.
4639. *Mr. Parkes.*] When you submitted the tenders for Contract 77 did you write as follows to Mr. Hickson:—"With respect to Messrs. Carter, Gummow, & Co's. second tender for a lump sum of £15,500, I find that it is accompanied by a special design on the Monier system"? Then Carter, Gummow, & Co. must have given in the design with their tender.
4640. You admit that you wrote that? Yes.
4641. Do you not think that at that time you had the design before you? I have had it.
4642. But is it not probable that you would have had it? Yes.
4643. *Mr. Gummow.*] Did Mr. Hickson ever instruct you to allow any officer in your department to make a drawing for Carter, Gummow, & Co.? No.
4644. *Mr. Parkes.*] You recollect when you made your plans for Contract 77? Yes.
4645. Did Mr. Hickson then ask you to make a plan on the Monier system? No, I do not think he did.
4646. Have you ever seen the plan on white paper now before you;—I am not referring to the tracing? I have.
4647. Did you ever see it in the Government office? Yes; I think I may say I am sure I saw it there.
4648. Did you see it done there? That is another matter. You will see from my report, that I say as clearly as possible, that Carter, Gummow, & Co. sent in a special tender with a design accompanying it. They having done that as an unexpected thing to me I could not very well have given instructions for a drawing to be made in the office.
4649. But you say that Mr. Hickson came to you at that time and told you to get a design made out on the Monier system? Yes. But I think that referred to M'Sweeney's matter.
4650. But it must have been long before M'Sweeney's matter came up? The question is whether this Monier plan was made in the office at the time these plans for Contract 77 were being made there? I do not think so.
4651. When did you first have that plan before you? It is very difficult to say. Of course, if I had not seen it before I wrote the letter which has been referred to, it must have been sent to me with the tender. But that is the question. I cannot remember now.
4652. When are the office stamps generally put upon the drawings? When they go downstairs for record.
4653. Is not the stamp a record that the plan is made in the office? Yes.
4654. Is it put on after the plan is made? Yes.
4655. The stamp is evidence that the plan is an office plan? It does not exactly indicate that it is an office plan. If a contractor for instance sent in a plan with a tender it would be stamped in that way and recorded.
4656. Who was the draftsman who worked next to Mr. Baltzer in the office? Mr. Littlejohn.
4657. Are you quite sure now in your own mind about this plan having been made in the office? Well, I cannot be certain, but I am under the impression that it was. I may be mistaken.

C.H. Ohlfsen-  
Bagge.  
22 June, 1896.

WEDNESDAY, 24 JUNE, 1896.

James Mitchell recalled and further examined:—

4658. *Mr. Parkes.*] Since you were here on Monday you have looked carefully through the returns which you then handed in, showing the payments by the Treasury to the firms of Carter & Co. and Carter, Gummow, & Co.? Yes.
4659. Did you find that it included the whole of the payments—Funded Stock payments and all? Yes.
4660. *His Honor.*] The return is absolutely complete? Yes; I hand in also an additional statement showing the payments in Funded Stock as distinguished from the other payments. [*Vide Appendix No. 23.*]

J. Mitchell.  
24 June, 1896.

Joseph Davis recalled and further examined:—

4661. *Mr. Parkes.*] What is the position of the culvert upon the Monier arch principle which the Department constructed upon the Parramatta Road? I cannot say from memory, but I think I might be able to identify it from the map.
4662. Was the experiment made by the office;—do you know who carried it out? I believe it was made from the Road Vote. I do not know of the matter officially, but having taken some interest in it I happen to know how it arose. The local officer recommended that an ordinary culvert should be built there at a certain cost—a culvert to be covered with buckle-plates. Comparative estimates were made of the culvert as proposed by him, and of a culvert on the Monier system, and it was found that the Monier system was considerably cheaper than the ordinary construction. It was not regarded as an experiment in a certain way, and yet in another sense it was an experiment. [*Vide Appendix No. 10.*]
4663. Did you make any other experiment of the kind? There was no other experiment by the Department, if you regard that as an experiment.
4664. Did the Department make any particular tests of the strength of the Monier system? Yes; we have prepared Monier plates which have been tested both at the University and in our own testing room.
4665. *His Honor.*] Did Professor Warren test them? He has, I believe, tested two or three plates for us.
4666. *Mr. Parkes.*] At what time would that be? Probably fifteen months ago.
4667. Did you test them in any work in particular? Nowhere except in the culvert to which you have referred.
4668. Can the Monier work be seen in that culvert now? Yes. Perhaps I might say in order to set the matter at rest—because there was an element of doubt raised by Mr. Bagge's evidence on Monday—that since then an officer of the Department has been to this place, and having made a special examination of it has found that the work has not moved in any sense whatever—that it is precisely the same as when erected.
4669. Did anything ever happen to it? I think Mr. Bagge got his impression—and I can only call it an impression—that the culvert had collapsed in this way. During the time the culvert was being constructed a small quantity of compo. was one afternoon put in position, and during the succeeding night there was, for Strathfield, a heavy frost. This perished the compo. It would not set, and it had to be removed. My recollection is that Mr. Bagge saw the compo. being put into position, and did not like the way in which it was being put in. He did not think the work was being put together as it should be. My impression is that I told him of that particular bit of compo. having been removed again.

J. Davis.  
24 June, 1896.

4670.

- J. Davis. 4670. How far was the arch built when this accident took place? It was in the first portion of the arch, if I remember rightly. It was on the northern side of the road. Just a few feet were affected—3 or 4 feet perhaps.
- 24 June, 1896. 4671. You mean in the completed arch? Yes; the culvert arch was built in two lengths. The traffic was turned on to the northern side of the road, and the arch was built on the southern side for one-half the width of the street, and then when that had had time to set the traffic was turned over on to that length of the arch and the second length was constructed.
4672. Then it was the first length which did not stand? It did stand as I have already explained. The traffic was entirely turned off this particular piece of bad compo. which was perished by the frost, and as a matter of fact, it was of so little consequence as to be scarcely worth mentioning. The compo. damaged was very small in extent.
4673. *His Honor.*] Was it a whole layer all over the arch that went? Yes.
4674. Then what you mean is it was of very small thickness? Yes; the arch is only 4 inches thick, I think.
4675. Was it the first layer of all that perished? The arch was constructed as a whole—that is, they commenced to put the compo. into position from each skewback, and worked up to the crown. A length of the arch was finished in one operation.
4676. The work was done in sections? Yes; but one half the arch was absolutely finished, and the traffic was turned across it before the second half was proceeded with.
4677. The arch was built in longitudinal sections of less than half the width of the road? Yes.
4678. And it was one of these longitudinal sections that was perished? Yes; Mr. Bagge must have got that into his mind, I think. I am not at present positive as to the position of the culvert, but I can let you know when I see the papers.
4679. Who was the officer who went out lately to see the work? Mr. W. A. Smith. His office is at North Sydney.
4680. *Mr. Parkes.*] What was the total cost of the culvert? I suppose you mean the total cost of the arch, because the abutments of the arch were common to both designs. The filling in over the buckle-plates or arch made very little difference—in fact, no difference whatever. The total cost of the arch was £222 odd. The cost of the compo. itself including the iron work was slightly over £4 per cubic yard, for the arch alone.
4681. What would the cost of the original buckle-plate design be? My impression is that £100 was saved in the culvert by the adoption of the Monier plan.
4682. *His Honor.*] As compared with buckle-plates on iron girders? The buckle-plates rested on the walls, but they had to be joined with bulb iron, so that the bulb iron acted as a girder.
4683. *Mr. Parkes.*] What was the thickness of the plates? The usual thickness. They are in parts, 3-16ths, 1-4th, and so on.
4684. And what was the length? They vary in size. Some are 4 ft. 6 in. square; some are 4 feet by 5 feet.
4685. And on the top of these would be put the concrete? Not the concrete. I think it was usual to put tarred metal on them.
4686. Were the abutments of stone or brick? The abutments were proposed to be of stone, but the abutments of the Monier structure were concrete.
4687. The abutments in the buckle-plate design were of stone? Yes; in the original proposal.
4688. And they were altered to brick in the Monier design? They were put in as concrete for the Monier structure.
4689. Did you carry out any other experiment in connection with this arch in any other locality? Not as far as the Department is concerned. Carter, Gummow, & Co. carried out an experiment at North Shore some two years ago.
4690. Where was that? In Alfred-street, near the tramway.
4691. Was that a culvert? No; it was an arch with a 30-foot span.
4692. Is it in existence now? No; it was broken up.
4693. Do you mean afterwards? I mean by the test. A uniform load was first put on, and it stood all right. We then put a load on one side, and that broke it up. It stood a good test.
4694. You say that when an unequal load was put on the arch broke up? Yes; when the ultimate load was put on.
4695. *His Honor.*] You mean that you went on testing the arch till you tested it to death as it were? Until we broke it. That is the usual way in which tests are made.
4696. You altered the nature of the test, and applied it to one particular part of the arch? Yes; we put it on one side of the arch, so that it would correspond more to a rolling load.
4697. *Mr. Parkes.*] Were not compo. arches tried by the Railway Department at North Shore when constructing the railway there? Not to my knowledge. I know that some of the railway officials were present at the test to which I have referred, and I know also that the railway was being constructed at the time.
4698. Do you not know that compo. arches, which were supposed to be put on the railway, were afterwards changed into brick? I am not aware of that.
4699. You never heard of that? No.
4700. Do you remember the thickness of the arch? In the case of the culvert I think it was 4 inches at the crown. I did not come here to-day prepared to be examined on these points, but I can obtain the fullest information later on, so that there may not be the least element of doubt.
4701. *Mr. Gummow.*] With regard to the buckle-plates, you say that the Monier arch was substituted for the buckle-plates? I did not say that precisely. I said that the local officer had proposed an ordinary structure, which is usually composed of stone walls and buckle-plates, and that the Monier system was substituted for it.
4702. Can you tell me the life of a buckle-plate? I estimate that it would probably be twenty-five years; but it would depend very much upon the treatment it received and the position in which it was put. If, for instance, it were exposed to salt air, it would cut away sooner than it otherwise would.
4703. I suppose sewage gas would affect it? Most decidedly.
4704. Did you put buckle-plates in some work at Wentworth Park some years ago? Yes.
4705. Are they now as good as ever? I have not examined them since they were put in, but they must have deteriorated to some extent.

4706. With regard to the test of the arch at North Sydney, do you know the reason of its breaking? Through its being loaded at one side. J. Davis.
4707. Do you know whether the cause of the breakage lay in the arch being too weak? No; the abutments moved. 24 June, 1896.
4708. In other words, it was the arch which was being tested, but the abutments proved to be too weak? Yes; they slid.
4709. It was not the arch itself that broke? No; the arch itself would have stood more had the abutments remained in position.
4710. Is it not the case that the abutments and not the arch gave? The abutments gave first.
4711. *His Honor.*] What you mean is that the abutments gave, and therefore the arch gave? Yes.
4712. *Mr. Gummow.*] It was not the weakness of the arch which caused the collapse? No. Had the arch been constructed between proper abutments no doubt it would have stood considerably more.
4713. You say that you put a uniform weight all over it and that it stood the test, and that you then put on a side-load? Yes.
4714. Can you tell me whether the arch was designed for a side-load or not? It was not. It was designed for a uniform load. If it had had a Monier grid on the extrados as it had on the intrados it would have stood the side-load all right.
4715. You had the side loaded up because the arch would not break with a uniform load? Yes.
4716. So as to give the gentlemen present a good idea of what might happen? Yes. It was thought that as a road bridge would be subject to that sort of thing it was desirable to test the arch in that way.
4717. Is it fair to test a bridge designed for a certain load with another load;—if you are designing a bridge, do you not know the strains to be put on it? Yes. You must do so before you can make a proper design.
4718. Then if this particular arch were built merely for a uniform load, would it be fair play to the design to test it with a side-load? No.
4719. What was the span of the arch? Thirty feet, I believe. It was 4 inches in thickness, I think, at the crown, and 6 inches at the springing. That is my impression, but the test was made so long ago that I have forgotten details.
4720. *Mr. Parkes.*] What was the weight of the load? I cannot tell you now, but I can get you the information later on.
4721. *His Honor.*] How and where was this arch built? It was built in the contractors' yard at North Shore.
4722. Were the spandrils of the arch filled in? No. There were two abutments built up to the level of the skew-backs, and the arch was built in between. What happened afterwards was that the abutments slid.
4723. Did the abutment on the side upon which the load was put give, or did the abutment on the opposite side give? The abutment on the other side gave.
4724. And then the arch buckled? Yes.
4725. If the extrados had been stiffened by a grid it would have held? That is the way in which they are constructed for road bridges, so that when the load approaches the bridge the iron near the opposite abutment is put into tension on the upper side of the arch and into compression on the lower side. The opposite happens when the load gets on to the other side of the bridge.
4726. With an even load, such as a load of water, the compression is almost always in a vertical line? Yes.
4727. And therefore you do not want the upper grid? No.

George Scott Chiene sworn and examined:—

4728. *Mr. Parkes.*] You are an engineer? Yes.
4729. What are your qualifications? I am a licensed surveyor. G. S. Chiene.
4730. In 1891 where were you employed? At the Town Hall. 24 June, 1896.
4731. Had you permanent occupation there? Yes; at least Mr. Richards told me so.
4732. Will you tell His Honor why you left the Town Hall? Mr. Carter asked me to engineer three sewers, viz., at the Glebe, at Waverley, and at Shea's Creek.
4733. Can you give us the whole of the conversation you had with him? They asked me how I stood at the Town Hall, and I said that I was getting £5 a week. They asked me if I was in permanent employment there, and I said I did not know. They said they would give me £6 a week if I came to them. I asked them to give me a few days to consider the matter, and I said that I would let them know. I afterwards wrote and told them that I would accept their offer. I received a verbal message in answer to my letter to the effect that I was to see them at St. John's Road.
4734. What arrangement did you make with them? Mr. Carter told me that I would be my own master, and that if they kept on with the contracts it would lead to a permanency. They said that if they had any luck they would give me a bonus.
4735. What was the date upon which Mr. Carter paid you off? I think it was in the first week of April, 1893.
4736. What was the reason of your leaving the firm? Mr. Carter told me that they had no work for me.
4737. Did you receive a testimonial from Mr. Carter at that date? I received a letter from him on the 17th March, 1893.
4738. It was in these terms, I believe:—"The bearer, Mr. Chiene, has been employed by us during the last three years as engineer on our various contracts in connection with the Sydney underground sewerage system. His connection with our firm has ceased solely through the stoppage of public works in this Colony. To anyone desiring a thoroughly competent and trustworthy man we confidently recommend him, and shall be very pleased to give any personal reference that may be required. The class of work Mr. Chiene has done for us requires the greatest care and thorough knowledge of engineering, both practical and theoretical?" Yes, that is the testimonial.
4739. Therefore you were not sent away by the firm on account of any lack of qualification, but simply because the work had ceased? Yes.
4740. You know of no other reason for severing your connection with the firm? There was none that I know of.

- G. S. Chiene. 4741. You have had a varied experience upon contracting work as it is carried out by expert firms? Yes.  
 4742. Will you tell His Honor what you saw occurring in connection with the contracts of this particular firm? I never saw a gauge fairly measured anywhere.  
 24 June, 1896. 4743. Of what contract are you speaking? Not of any contract in particular.  
 4744. You are referring to the concrete guage? Yes.  
 4745. In what way was it unfair? The blue metal and sand were always heaped up, and in plastering the cement was short in quantity.  
 4746. Do you remember being on one particular occasion at the office of St. John's Road at the Glebe? Yes; I saw Mr. Carter there several times.  
 4747. Do you remember his being there on one particular occasion when he left something? Yes; I remember a spirit-stand being left there. It was brought up in a parcel, and a message was left that if a man came from Mr. O'Hanlan the parcel was to be delivered to him.  
 4748. Who was Mr. O'Hanlan? One of the Government engineers.  
 4749. What occurred after that? I told Jack Reid, the contractor's manager, of the message.  
 4750. What occurred after that? Reid tore the parcel open and looked at it. When he saw what it contained he said "I do not begrudge him it because he has done the firm some service at North Shore."  
 4751. Upon what contract would that be? I do not know.  
 4752. Did you see and hear this? I did.  
 4753. You saw what the parcel contained? Yes.  
 4754. What was it? A spirit-stand with three cut bottles in an oak frame.  
 4755. On one occasion you had a conversation with Jack Reid, the manager for Messrs. Carter & Co. in the office? Yes; in the Glebe office.  
 4756. What occurred there? Reid told me that many of the inspectors were being paid by the firm. I refused to believe it, and he took me down one of the paysheets and showed me the names.  
 4757. What names did you notice? The name he particularly showed me was Inspector Corpe. It appeared from the paysheets that he had received £1.  
 4758. Did Reid also tell you anything about a man named Goddard? Yes. I may say that if Reid had not called my attention to these things I should not have known about them.  
 4759. *His Honor.*] All that you know is from what Reid told you? Yes.  
 4760. *Mr. Parkes.*] What did Reid tell you about Goddard? He told me that Goddard had gone down and had marked all the places where they had put in shale between Nos. 12 and 13 shafts.  
 4761. What was the sewer cased with? It was supposed to be cased with concrete, and the shale and muck was going in to fill up the holes before the concrete went in.  
 4762. What occurred after that? Mr. Carter came to the office.  
 4763. You were there at the time? Yes; Reid nodded to me when we got outside, and he said, "We had better clear, as Carter wants to square with Goddard."  
 4764. Did Goddard come to the office? Yes; he was in the yard when we went out.  
 4765. Did he go into the office with Mr. Carter? He went to the door.  
 4766. But did he go in? I did not see him go in.  
 4767. What became of Goddard after that? He went to Melbourne or to Broken Hill.  
 4768. Where is he now, do you know? I heard that he was keeping a public-house at Broken Hill.  
 4769. When did he leave the job? Almost immediately afterwards. He did no more work on the job that I know of.  
 4770. Where were shafts Nos. 12 and 13 located? No. 12 is in St. John's Road, just above the Congregational Church, and No. 13 is in a lane at the back of the Congregational Church.  
 4771. Is that sewer connected yet? I believe so, but cannot say for certain.  
 4772. *His Honor.*] What is the number of the contract? No. 65.  
 4773. *Mr. Parkes.*] What was meant by Reid when he referred to Goddard marking certain places? I took him to mean the places where they were putting in shale to fill up the holes.  
 4774. You know a man named Martin Byrnes? Yes.  
 4775. You were present at the head of shaft No. 12 when a conversation took place between the contractor's manager, Reid, and Martin Byrnes? Yes.  
 4776. What was it? Reid told Byrnes to get the mullock put in as soon as possible.  
 4777. What was Byrnes's reply? He said that if he were caught he would be hanged for it, and he added, "All right, I will be hanged for it. You clear out and keep the Inspector away."  
 4778. Manager Reid frequently boasted to you about his trying to do the Inspectors, did he not? Frequently.  
 4779. Did he not give you an illustration on one occasion? Yes; he told me that Gledhill had told him not to fill up No. 9 shaft at the head of Mitchell Road till he was present, and Reid said he had got the men to do it at 5:30 in the morning, before Gledhill came.  
 4779½. What shaft was that? No. 9 shaft.  
 4780. On the same job? Yes.  
 4781. Did Mr. Snodgrass ever have any conversation with you? Sometimes.  
 4782. What did he ask you to do on one occasion with Corpe? He asked me to make out a calculation as to the number of batches of concrete that ought to go in.  
 4783. Was there anything further? He told me what to do, and I did it.  
 4784. What was the calculation on? It was a simple return of what ought to go in according to the cross-sections.  
 4785. *His Honor.*] In some particular length of sewer do you mean? Yes.  
 4786. In what length? I could not tell you now.  
 4787. *Mr. Parkes.*] Do you know a man named Harry Labrees? Yes.  
 4788. He had a conversation with you, I believe? Yes.  
 4789. He complained that the Inspector was too strict with him? Yes.  
 4790. What happened? He was told to be careful for a few days, as there was a suspicion on the part of the Department.  
 4791. Who told him? Mr. Snodgrass told him.  
 4792. What else did he say? He said he would rather lose £50 than be caught.  
 4793. Did not Reid on one occasion show you a cask of cement in one of the offices? Yes; he drew my attention to a cask of cement which was kept in stock.  
 4794.

4794. What for? From which to send in tests for any consignment of cement which might come in. G. S. Chiens.
4795. That is to say, when any tests had to be made this one cask was made to stand for the lot? Yes.
4796. Do you know of your own knowledge that that was so? Well, he showed me the cask, and he told me that he was going to plant it for further use. 24 June, 1896.
4797. Of course, as engineer, you had to watch the concrete going in? As engineer I was never asked to do that.
4798. But you say that you saw it? As I was passing different shafts I saw it.
4799. What class of concrete was it? Pretty fair, as a general rule.
4800. You said first of all that gauge was overloaded? Well, the blue metal or the white metal and the sand were always heaped up, and then a cask of cement would be put in. In other instances the proper quantity of sand would be put in, and there would be less cement.
4801. Did you see the gauging? Not always.
4802. *His Honor.*] What was the practice as to the cement; was it gauged as a regular thing;—or would a certain number of casks of cement be used as representing a certain bulk? The cask is generally put in holus-bolus.
4803. But is it the practice to gauge the cement in the gauge-box, or to treat so many casks of cement as representing (say) a cubic yard? In concrete a cask of cement is used as representing 4 cubic feet.
4804. So that the practice would not be to put the cement out of the cask into the gauge-box? Not in the case of concrete, but that is done for rendering.
4805. Is there not a method of gauging the sand, metal, and cement, in the mass for sewer packing? A gauge-box is made for the blue or white metal and a gauge-box for the sand, and the cask of cement would represent 4 cubic feet.
4806. I understood you to say just now that the blue or white metal would be heaped up, and that the sand also would be heaped up in the gauge-box, and that then the cask of cement would be put in? Yes.
4807. I want to know what you mean by that? The box is supposed to contain 16 feet of blue metal. The metal is measured in it in the way I describe, and is put on to the board. The sand is then measured and put on, and finally the cask of cement is added.
4808. You mean that one cask of cement would be the proper amount if the other materials were not heaped up in the gauge-box? Yes.
4809. What you complain of is the heaping up of the metal in the gauge-box? Yes.
4810. *Mr. Parkes.*] In all cases, I suppose, the master contractor cannot be responsible for his men? I do not say that he is.
4811. Men on these jobs often endeavour to help the master contractor out of kindness? Yes.
4812. That has been the practice always? Yes; a number of these acts are done without the masters knowing anything at all about them.
4813. But that could be stopped, could it not, if the work were properly supervised by inspectors? A great deal of it could.
4814. That would be a very simple matter if the inspectors did their duty properly? Yes.
4815. Even on the part of the inspectors, I suppose you would describe what is done as being more in the nature of carelessness than wrong-doing? Yes.
4816. But if the work were properly supervised there can be no doubt about this—that the bad work would not go in? Not one-half as much as it does.
4817. Are you confident, in your own mind, that bad work was going on on the contracts on which you were engaged? Yes.
4818. You are perfectly certain of that? Yes; absolutely certain.
4819. *Mr. Smith.*] You say that you are confident that on these contracts there was some bad work? Yes.
4820. Of what contracts are you now speaking? I am speaking of the works at the Glebe and at Waverley.
4821. You cannot identify the number of the contracts? No.
4822. How long were you on the Glebe contract? Twelve months, with the exception of six weeks.
4823. Did you go there direct when you left the Town Hall in 1891? Yes.
4824. When did you leave the Glebe? On 27th February. Mr. Carter asked me to go and see Parry and Farley on the 29th. I called on Mr. Farley at Mr. Carter's request.
4825. You then went to engineer Parry and Farley's job at Darling Point? Yes.
4826. You were on the Glebe contract from early in 1891 until February, 1892, is that it? Yes.
4827. When, then, did you go on to the Waverley job? At different times during the same period—that is from 1891 to 1892.
4828. Who was the engineer on the Glebe contract? Mr. Rudolph.
4829. Who is Mr. O'Hanlan? He is a Government engineer.
4830. Was he over Mr. Rudolph? No; he had nothing whatever to do with the job.
4831. Do you know Mr. O'Hanlan? When he came there I was introduced to him, but I had never seen him before.
4832. He had nothing whatever to do with this contract? Not that I know of.
4833. Did you hear that at that time Mr. O'Hanlan was about to be married? Yes.
4834. Just about the time that this little present arrived for him? Yes.
4835. You are sure you heard that? Yes.
4836. As to the inspectors you have referred to—I suppose you mean the Government Inspectors on the work? Yes.
4837. Who were they? Jack Brown, Gledhill, Dick Eyre, Corpe, and Norby. These are the only ones I know of.
4838. Who had charge of the concrete work;—who was the inspector who was overlooking that? Gledhill and Eyre, I believe.
4839. I suppose you know the men who were working on the contract? Most of them.
4840. Who were the men who were doing the bad work—what are their names? Martin Byrnes was one.
4841. Who were the men you saw doing the work? I never saw any. I never interfered with the work at all.
4842. You never actually saw any of the men doing bad work? I do not think I did.
4843. Martin Byrnes was the man who was told to do it? Yes.

- G. S. Chienc. 4844. Is there any other reason you have for saying that bad work was done there beyond your hearing Byrnes being told to do it; you say you never saw anyone doing it? I never even tried to look.
- 24 June, 1896. 4845. What makes you think then that bad work was being done? Because Jack Reid was everlastingly talking to me about it.
4846. Did he say that the men were doing bad work? Over and over again.
4847. He told you so? Most distinctly.
4848. Did he specify the nature of the bad work? Sometimes.
4849. *His Honor.*] Jack Reid was discovered to have a conscience—is that what you mean us to understand? I am only telling you the truth as he told it to me.
4850. But in what tone, in what manner did he tell you;—with what object? Generally in a boasting one.
4851. *Mr. Smith.*] Did he seem to be proud of it? Yes.
4852. Did he say anything about the inspectors? Yes; he told me that Mr. Carter paid some of the Inspectors.
4853. Did he mention the names of the inspectors who had been paid? Yes.
4854. Who were the inspectors who were said by him to have been paid? Dick Eyre was one of the persons mentioned. I refused to believe it, but he took down the pay-sheets and showed me.
4855. Jack Reid told you that Mr. Carter had told him that he had squared Eyre, is that it? No; but every now and again Jack Reid said that Eyre wanted to see Mr. Carter. I asked him what for, and he said, "Carter is as good as 30s. a week to him."
4856. But did he ever tell you that Mr. Carter paid Eyre anything? Not beyond what I tell you. When I refused to believe him he took down the pay-sheets and showed me the name.
4857. Eyre was one of the sub-inspectors, I believe? Yes.
4858. Had he anything to do with the concrete? He was watching the gauging on the top.
4859. Did you ever see Eyre at all? Frequently.
4860. You did not see any of this bad work being done when he was there? I never saw any of the bad work being actually done.
4861. Was this Mr. Jack Reid, the contractors' manager, in charge of the whole of the job? Yes; so far as I know he was.
4862. *His Honor.*] Was he in charge of more than that contract? No; he was in charge of the Glebe job.
4863. *Mr. Smith.*] Who is the man Goddard you mentioned? He is one of the miners.
4864. Employed by the contractors? Yes.
4865. Was he also on the Glebe job? Yes.
4866. What had he to do with the concrete packing? Jack Reid told me that he suspected that they were doing bad work, and he went into the tunnel and marked the places where the bad work was going on.
4867. Who went in? Goddard.
4868. Have you seen him since he left the job? I have not. I am told that he is keeping a public-house at Broken Hill.
4869. So that this bad work which you say existed upon Contract 65 you can only speak of from what you have heard from the persons you have mentioned? That is all.
4870. You left the employ of Messrs. Carter, Gummow, & Co. in April, 1893? Yes.
4871. When did you first mention this bad work to any one? I have spoken of it to miners and others at different times.
4872. But when did you first mention it? I dare say on the Glebe job.
4873. But since you left, I mean? I think at the commencement of this month.
4874. That was the first time you mentioned it since you left the firm? No; that was the first time I mentioned it to Mr. Parkes. I have spoken of it at different times in the interval to contractors, to miners, and others.
4875. Since you left the employment of the firm? Yes.
4876. You mentioned it to Mr. Parkes you say? Yes; I had a letter from Mr. Parkes, in which he asked me to call upon him. Otherwise I should not have gone near him.
4877. You called on him and made a statement? Yes.
4878. What have you been doing since you were last employed upon these contracts? Several times I have been idle from month to month.
4879. What are you doing just now? Nothing just now.
4880. With regard to the testing of the cement, do you know how that is done on a job of this kind? I have not been present in the Government offices when the cement has been tested.
4881. So that you do not know how it is done? No.
4882. You do not know in fact whether one cask is not taken out of every fifty by way of testing? At any time they had to send in a test the cask would be produced, the inspector would take what he wanted, and he would then mark the cask.
4883. You do not know how many he would test out of every hundred? I do not know.
4884. As to this particular cask, which was planted for the purpose of testing, did the inspector go to it, do you know? It was taken to the inspector.
4885. The inspector, then, would test only the cask brought to him? He would take out a sample in a tin and send it to the office. He has to send in a certain quantity of cement to be tested.
4886. From which cask would he select the cement? From the cask given to him.
4887. He would not select the cask himself? If he liked he could do so.
4888. But you say that he did not? I suppose not. If my attention had not been drawn to these matters by Reid I should not have known anything about them.
4889. In this instance you say the inspector took only the cask which was brought to him for testing purposes? Yes.
4890. How often do you know of that being done? It was done only once that I know of.
4891. Who is the inspector who took the cement for testing? Gledhill, I think, but I would not be certain.
4892. Just think again? Gledhill's name strikes me as being the right one. It was Reid who drew my attention to the matter.
- 4893.

4893. But do you know for certain who the inspector was? To the best of my belief it was Giedhill. G. S. Chiene:
4894. Who were the other inspectors who had to do with the concrete? The test I have referred to was the only test I ever saw sent in. 24 June, 1896.
4895. Who was over the inspector who had to do with the test? No one that I know of.
4896. So that it must have been the man you have mentioned? I think it is very likely.
4897. *Mr. Gummow.*] You say that you were engaged at the Town Hall? Yes.
4898. Had you permanent or only temporary occupation there? At the time it was only temporary, but when Mr. Carter came to me I spoke to Mr. Richards, and he said that as far as he was concerned my employment there might last seven or eight years.
4899. Did he know how long it would last? No.
4900. Then it was only temporary occupation at that time? Just so.
4901. How long were you with our firm? Two years.
4902. Had you an engagement with the firm? Yes.
4903. Did you stay with the firm for the two years? I would have done so if Mr. Carter had not asked me to go to Darling Point. He paid me the balance of about six weeks after I left Parry and Farley.
4904. Parry and Farley did not pay you? Well, Mr. Carter said, "If Parry and Farley do not pay you I shall."
4905. What I want to know is who paid you for the two years? I was with Messrs. Carter, Cummow, & Co. for the one year, and with Messrs. Parry and Farley for the other.
4906. Did not Messrs. Carter, Gummow, & Co. find you employment with Messrs. Parry and Farley? Yes.
4907. With reference to the delivery of the spirit-stand of which you have spoken, do you know if it was delivered to Mr. O'Hanlon? To Mr. O'Hanlon's man.
4908. You are certain of that? Yes.
4909. Do you know the object of the gift? It was given as a wedding gift, I believe.
4910. Is not such a gift usual between friends when one of them is about to get married? Yes. So far as I am concerned I would not care if the gift had been £1,000; I am only alluding to it because Jack Reid said he thought O'Hanlon deserved it.
4911. What impression do you wish to leave from our reference to the subject? Simply that a person was being bribed.
4912. Do you not know that it is a rule among friends to give one another wedding presents? Most decidedly.
4913. Was Mr. O'Hanlon connected with this work at all? Not at all.
4914. Has he been connected with any of Carter, Gummow, & Co.'s works, do you know? Not that I know of.
4915. Did not Mr. Carter visit Mr. O'Hanlon's house as a private friend? As far as I know he may have done so.
4916. Do you know if any other member of the firm did so? Yes, Mr. Snodgrass did.
4917. As far as you know, Mr. Carter and Mr. O'Hanlon were personal friends outside of their work? As far as I know.
4918. That being so, does it seem strange to you now that Mr. Carter should have left a spirit-stand for Mr. O'Hanlon purely as a matter of friendship? Not at all. I should not have thought anything of the matter but for Reid making the remark he did.
4919. Did you look upon the gift as a bribe? I did.
4920. With regard to Corpe, where is he now? I was told the other day that he is dead.
4921. You say that you saw on one of the pay-sheets the amount of £1 for Corpe? Yes.
4922. Do you know what happened to him? No.
4923. You do not know for certain that he is dead? Joe Husband and Eyre told me the other day that he was dead. I knew that he had consumption.
4924. Do you know that Mr. Carter gave him other money? I do not.
4925. Do you know that Mr. Carter paid his funeral expenses? No.
4926. But if you heard of such a thing, would you believe it? Yes.
4927. You think that Mr. Carter is pretty liberal to people as a rule? Undoubtedly.
4928. Do you now say that you consider the amount of £1 to be a bribe to Corpe? I looked upon it in that light.
4929. Would you consider the payment of his funeral expenses in the nature of a bribe? I knew nothing about that till you mentioned it.
4930. But you would not regard it as a bribe? No.
4931. But if he would do the one thing he would be likely to do the other. If he gave the man £1 he might be afterwards induced to pay his funeral expenses from some improper motive;—do you really see any difference between the two cases? I do not know anything about it. If Reid had not mentioned the matter to me—if he had not suggested that the money had been given as a bribe—if he had not said that the man deserved it—I should not have known anything about it.
4932. It was that which made you think it was a bribe? My opinion is that it was a bribe because he told me so.
4933. At all events you do not regard the payment of his funeral expenses as a bribe? Certainly not.
4934. As to Goddard, you say that Reid told you that he was going to be squared by Mr. Carter? He did.
4935. What was the subject upon which he was to be squared? Did you know that Goddard had summoned Carter, Gummow, & Co? I do not know.
4936. You do not know that Goddard came there for wages which were due. You do not know anything about the matter of your own knowledge? No.
4937. If you were told that Goddard had summoned Carter, Gummow, & Co. for wages would you believe it? Certainly I would.
4938. Do you know whether, as a matter of fact, Goddard went down to be squared for a sum of money due as wages? I do not.
4939. As to this conversation between Martin Byrnes and Reid, when Byrnes said "that he would be hanged if the inspector were not kept out of the way," do you know whether he did bad work? I believe he did, but I did not see it.
4940. Did he do it? I could not tell you. 4941.

- G. S. Chiene. 4941. You say that Harry Labrees said that inspector was too severe? Yes.
4942. Is that an unusual thing for contractors' men to say? It is the first time I heard it.
- 24 June, 1896. 4943. Did you ever hear of contractors' men leaving because inspectors were too severe? Connors, the bricklayer, told me that he had to leave an account of the inspector.
4944. Is it not a well-known fact that the inspectors are often particularly severe on certain men—I suppose they have their little grievances as well as other persons? Yes, they may have.
4945. Do you not know that it is so? I never saw anything of it.
4946. But, as a matter of fact, do not you know that it is the case among the men? Yes, I do.
4947. You say that Reid showed you a cask of cement, from which the cement to be tested was taken? Yes.
4948. When you saw the inspector—I think you said it was Gledhill—take the cement to be tested out of a cask, did you recognise it as the same cask that Reid had pointed out to you as the one which he was planting? All I know is that the cask was there, and that Reid said he would plant it.
4949. But did Gledhill take the test cement from the same cask? Yes.
4950. You are quite sure of that? Yes, quite.
4951. How many casks were there there from which tests would be taken? I only saw one.
4952. Did you ever tell the contractors what was going on? I never did.
4953. Since you left the employ of Carter, Gummow, & Co. have you ever had any conversation with Mr. Carter? Once.
4954. While you were in the pay of the firm did you ever meet with an accident? I did.
4955. How did it happen? I was endeavouring to get out of a tram while it was in motion, and I was thrown down.
4956. Were you sober at the time? Perfectly.
4957. Where were you taken to? To St. Vincent's Hospital.
4958. Was your salary paid during the time you were there? It was.
4959. Was anyone employed in your place while you were away? Yes, after a time there was.
4960. Did you pay for his employment in your place? I did not.
4961. You say you spoke to Mr. Carter once since you left the firm's employ? Yes.
4962. Did you ever ask him for any assistance? Not after I left the firm.
4963. Did he ever give you any assistance after you left the firm? He sent for me to see him at North Sydney on, I think, the 9th November, and he asked me if it were true that my family were starving. I said "Yes." He said "I cannot see your wife and children starve." He gave half a sovereign, and I afterwards learnt that he had paid my baker's bill for three months.
4964. Did he give you anything else after you left the firm? Yes, he gave me a cheque for £20.
4965. What was that for? I had asked him for £100 on a previous occasion and he gave me a cheque for £20.
4966. What for? To assist me.
4967. That was in 1893 you say? Yes.
4968. After you had left the employ of the firm? Yes.
4969. After your engagement was at an end? Yes.
4970. Did you consider the £20 a bribe? I had not asked for it. I had asked for the loan of some money and I offered to give him a receipt for it.
4971. But do you consider that he gave you the money as a bribe or out of pure good nature? From good nature if you like.
4972. That is a little way of Mr. Carter's,—he is good-natured to those who are deserving of it when they are in a less fortunate position than himself? In this case I asked him if he would give me £20, and he said he would. I said, "Shall I give you a receipt?" and he said, "No, you need not do that."
4973. *His Honor.*] Did you consider it a gift? I asked for the money as a loan, but when Mr. Carter refused to take a receipt I did not know whether to regard it as a gift or not. I never attempted to pay it back.
4974. *Mr. Gummow.*] As a matter of fact you treated it as a gift? I did.
4975. Do you not know that Mr. Carter is very liberal? I think he is.
4976. At all events you did not consider the £20 a bribe? No, certainly not. Had it been offered to me as a bribe I would not have taken it.
4977. Do you think that if, under ordinary circumstances, Mr. Carter saw a man in bad health, especially a man he had known well, he would be likely to help him? I believe he would.
4978. *Mr. Smith.*] When did you see Jack Reid last? About fortnight ago.
4979. Did you see him before you saw Mr. Parkes? I saw him in the street, but I did not speak to him.
4980. When did you last see him to speak to? About a month or six weeks ago.
4981. Did you talk about this thing then? A little.
4982. You did talk about it? We just mentioned it.
4983. What sort of a man is Jack Reid—is he a sober man; have you ever seen him the worse for liquor? Very rarely.
4984. When he is in that state his tongue runs pretty freely? I dare say it would.
4985. Did he ever tell you that he had been turned away from a job at North Shore? No.
4986. That he had been moved from it I mean? Not that I know of.
4987. He never told you that? Never.
4988. He never told you that Mr. Hickson had insisted upon his removal from a job at North Shore? Never.
4989. *Mr. Parkes.*] Where does Jack Reid live? As far as I know he is living at Waverley.
4990. When was your last payment for services made to you by Carter, Gummow, & Co.? I think it was in the first week in April, 1893. Mr. Carter told me that they would pay up to the end of March, and the fortnight fell, I think, in the first week in April.
4991. Was the £20 in addition to that payment? Yes; I looked upon it as a gift when Mr. Carter refused to take my receipt.
4992. Mr. Carter has always been a generous man with his employees, has he not? Yes.
4993. If Mr. Carter gave an inspector a spirit stard as a wedding gift it could not be looked upon as a bribe? No; I should not have thought anything of it if Jack Reid had not made the remark he did.

4994. *Mr. Smith.*] What was the remark he made? He said he did not begrudge it him, as he had done the firm some service at North Shore. G. S. Chiene.
4995. *Mr. Parkes.*] What other men were working on the Glebe job beside Reid, Byrnes, and Goddard;—do you know any of them? I should know a great many of them if I saw them. I do not remember their names now. I believe Jimmy Hoskins was working there, but I would not be quite sure. 24 June, 1896.
4996. Did you take measurements for the job? Only when we were driving.
4997. Only for the driving? Yes. I took cross-sections with the Government engineer
4998. Have you any idea of the size of the excavation? I have no records.
4999. *His Honor.*] Do you happen to know in what part of Waverley Reid is now living? Near Denison-street, I think.
5000. Has he been living there some little time? Since he left Carter, Gummow, & Co., I think.
5001. *Mr. Gummow.*] With regard to the spirit-stand, did you not say that you regarded it as a bribe? Yes, when Reid made the remark he did, otherwise I should not have done so.
5002. As to Reid's remark that he did not begrudge the spirit-stand, was Reid a member of the firm, or had he any interest in it? No. I took it that he was jealous, and that he thought he was not getting enough pay himself.
5003. *His Honor.*] From Carter, Gummow, & Co.? Yes.
5004. What was his pay, do you know? £3 a week.
5005. Did you hear Reid grumble about his pay on more than one occasion? Yes; he grumbled more than once about it to me.

William Gilliver sworn and examined:—

5006. *Mr. Parkes.*] You are a contractor of some standing? Yes; I have been a good while at the game now. W. Gilliver.
5007. Have you carried out many sewerage contracts for the Government? I have carried out several. 24 June, 1896.
5008. In carrying out these contracts you have tendered upon a form in which the Government put down not only their own quantities but also approximate prices? Yes.
5009. And at times you have had good prices as well as bad prices? Yes, the prices being a percentage on or off, as the case may be.
5010. Have you always done that? No. The Government do not supply quantities just now. The system has been changed about a good deal. At one time the Department supplied quantities but not prices.
5011. How long ago is that? Two and a half years.
5012. After that what did they do? They fixed quantities and also prices. We tendered per schedule.
5013. *His Honor.*] You tendered, then, at a percentage? Yes, at a rate above or below the schedule or at par.
5014. *Mr. Parkes.*] How long have you been tendering in this Colony? About seven years.
5015. Going back from two and a half years ago, quantities only were issued to the contractors, were they not? Yes, without prices.
5016. *His Honor.*] The latest form of tendering, I understand, is without quantities? Yes.
5017. *Mr. Parkes.*] Two and a half years ago schedules were issued with prices attached? Yes, I am now speaking of a job we did at Rookwood—I mean the drainage of the Necropolis. There were quantities in that case without prices. Since then, in the case of other jobs we have carried out, there have been prices attached and also quantities. Now you have to confine yourself to the prices. You have to tender on or off, or at par, for the whole of the items.
5018. Have you tendered in other cases apart from the Government where quantities were given? Yes. We have done some water-works for municipalities.
5019. In those cases the quantities have been given? Yes; there would be an approximate quantity. It would be at per yard run.
5020. But there would be no prices given? No; you fixed your own prices.
5021. To return to your explanation, a change in the case of the Government tendering was made about two and a half years ago under which prices also were put in? Yes.
5022. And there has been another change lately? Yes, that is the change affecting the sewerage contracts now advertised.
5023. What change is that? No quantities are given, only prices.
5024. The contractors have to fill in their own quantities? Yes. They tender at a percentage.
5025. But putting in their own quantities? Yes. I presume they would take out their own quantities in order to arrive at values—to see what percentage they could take off.
5026. In the middle of last year a change in the quantity sheets was again made, under which you were asked to tender at a certain percentage below prices? Yes, or above.
5027. *His Honor.*] The quantities and prices being also given? Yes.
5028. *Mr. Parkes.*] You tendered for No. 77 Contract? Yes.
5029. When the tenders for that contract came in, you saw that another firm of contractors had received the work at a lump sum? Sometime afterwards. Carter, Gummow, & Co. were the lowest with the percentage off. They also put in a lump sum tender of, I think, £15,500.
5030. Would it ever occur to you, as a contractor, that you would be permitted to send in a plan of your own with a lump sum tender which might be accepted? According to the conditions of tendering I should think that a lump sum tender would be ruled informal. If I am not mistaken it says so in the forms and conditions of tendering. I think you will find that stated on the front page of the tender form. If you turn up the tender form for that particular contract you will find it is so.
5031. It says on the front page, "In pursuance of advertisement in the *Government Gazette* I (or We), the undersigned, do hereby tender to provide the material and perform the various works required in and about the full and proper construction, erection, and completion, of the northern main sewer, Leichhardt and Annandale section, Contract No. 77, agreeably to the plans, specification, schedule to specification, special condition, and general conditions, which have been inspected by me (or us), &c." There is then a marginal note which says, "Here insert 'under' or 'above,' as the case may be, or erase the words 'per cent.' if the party is desirous to abide by the prices as fixed";—you think that that would not permit of your sending in a lump sum tender? It would not. [*Vide Appendix No. 12.*]
5032. It does not contemplate it? No. 5033.

- W. Gilliver. 5033. *Mr. Parkes.*] There was another instance in which Carter, Gummow, & Co. sent in a lump sum price on similar lines for a job for which you tendered? On a job in which we were second, and which is now being carried out by M'Sweeney. I think it was Contract No. 107. I know that the work runs across Stanmore.
- 24 June, 1896. 5034. Did they in that lump sum beat you and the other contractors? They did at the lump sum, but I should like to explain matters in connection with that contract. The office estimate was £32,000 and some odd pounds; and, running it out at these quantities and prices, Carter, Gummow, & Co. tendered at £29,111. They also sent in a lump sum tender at £23,000, which was the lowest. M'Sweeney's tender worked out at £24,000. I had them worked out at the time, and I wrote about it to the Under Secretary for Public Works.
5035. Where did you get the copy of the tenders? My engineer worked it out from the tenders in the Public Works Office.
5036. There is no doubt that his figures are correct? I do not think there is any doubt about it.
5037. Although Carter, Gummow, & Co.'s prices worked out at £29,000, they put in a lump sum tender for £23,000? Exactly.
5038. What did you contractors do in that case? We discussed the matter, and it was arranged that I should write to the Minister taking exception to the acceptance of any tender at a lump sum.
5039. And you did so? Yes. If lump sum tendering was to be allowed in that case we were prepared to take up the job at less than £20,000. The quantities were in excess of what they actually came out at on the plans. Our engineer went into it, and we found that we could take the job for less than £20,000. I remember writing to the Under Secretary to that effect. I suggested that fresh alternative tenders should be invited with a lump sum, so that all contractors should have an equal chance of tendering, but we had no reply, and, as a matter of fact, M'Sweeney's tender was accepted.
5040. Did you ever have any conversation with any of the officers about this form of lump sum tendering? The matter was discussed by the contractors and engineers, and we thought it very unfair that any notice should be taken of a lump sum. We thought that if a lump sum tender was to be received all contractors should be put upon an equal footing.
5041. Did you have any conversation with Mr. Hickson about the matter at that time? No; I only wrote to the Under Secretary for Public Works.
5042. Under these circumstances, did the contractors get alarmed about the system of public tendering? Well, we wanted to be put on an equal footing.
5043. And as a result of your discussion a deputation waited upon me? That is so.
5044. *His Honor.*] That would be later on? Yes.
5045. What you have been referring to happened some time previously? Yes.
5046. *Mr. Parkes.*] When did it happen? I suppose you are referring to the deputation. I do not know the exact date, but it was after tenders were accepted upon the Monier plan that we waited upon you.
5047. That is when the lump sum system came into operation? Yes.
5048. The body of contractors who waited upon me laid certain matters before me? Yes.
5049. Will you tell His Honor what they were? It principally turned upon the question of one firm of contractors being allowed to tender at a lump sum, and their tender being accepted; and, as contractors, we wanted all to be placed upon an equal footing. Of course many other things cropped up. One had one thing to say and another had another thing, and so on. My object in waiting upon you was to have the thing ventilated. I had written to the Under Secretary on behalf of the contractors, and since a lump sum tender had come up a second time in connection with this particular job, we thought it right to take action to protect our interests, and to put us all upon an equal footing.
5050. Did you not represent to me that if the Monier system were adopted one firm of contractors would have a monopoly of the work? Yes. Of course, they had a monopoly if they had the patent. At that time I did not know whether it was clear that they had.
5051. As a matter of fact, as a contractor, would you hesitate at the present time about entering upon a construction of ironwork and compo.? The thing is entirely new to me.
5052. You have never done such work before? No.
5053. Coming to Contract No. 77, I believe you are carrying out the adjoining contract? Yes.
5054. In Contract No. 117 you are paid at the rate of 28s. per cubic yard for excavations in rock where charges of powder not exceeding 4 inches in length are allowed? Yes, less 9·01 per cent.; upon Contract No. 77 the price is £2 17s. [*Vide Appendices Nos. 12 and 16.*]
5055. That is your actual payment? Yes.
5056. Will that price pay you? I hope so.
5057. Do you think it will? Yes.
5058. You are satisfied with it? Yes. I expect to make 12 per cent. out of it.
5059. Is there any difference as regards the solid rock to be excavated where 4-inch charges of powder are allowed as between Carter, Gummow, & Co.'s job and yours? No; it is all about one class of ground. If anything, they have a bit the best of it, because they have a bigger tunnel than we have, and the bigger the tunnel the lower the price at which it can be taken out.
5060. Have you any excavation in your contract where guttering and gadding only are permitted? Yes.
5061. What is the rate at which you are being paid? £1 15s. per cubic yard, less 9·01 per cent.; the price on Contract No. 77 is £3 5s.
5062. *His Honor.*] Your contract is No. 117? Yes.
5063. And it follows on from No. 77? Yes; we junction with Carter, Gummow, and Co.'s job midway in the hill.
5064. On the north-west side of White's Creek? Yes.
5065. *Mr. Parkes.*] Let us now take bluestone concrete in any situation—what are you being paid for that? I think the Government price is £2 per cubic yard.
5066. What is the price in Contract 77 for bluestone concrete in any situation? £2 10s.
5067. Do you think £2 will pay you? Yes.
5068. Will it pay you well? I expect to make from 10 to 15 per cent. upon the whole contract.
5069. Taking the whole of the prices, as far as you can recollect them, in the case of Contract 77, they represent a great increase upon the prices in Contract 117, do they not? Yes; in some cases they are 100 per cent. higher.
5070. And the nature of the work is not different? No; it is the same. Their drive, however, is a little larger than ours, and they have a slight pull upon us in that respect. 5071.

5071. You have had some experience of the system of tendering under which the Government have issued prices, as well as quantities? Yes. W. Gilliver.

5072. The contractors, of course, find it to their own interest to take advantage of that system? We could not find any advantage in it. 24 June, 1896.

5073. *His Honor.*] I wish to understand clearly the three systems of tendering to which you have referred. Under the first system I understand quantities only were given, and the contractors had to supply the prices? Yes. That was in vogue up to about two and a half years ago. In no case, then, did the Department fix prices.

5074. Under the next system the Department fixed the prices as well as the quantities? Yes.

5075. And under the third system the Department fixes the prices only without fixing the quantities? Yes.

5076. *Mr. Parkes.*] Under the second system the Department fixed the prices and quantities, and the contractors had to take all the responsibility—the prices given by the Department being only leading figures? The items in the schedule which had the prices fixed against them might be increased or diminished, and you were paid at that rate. You could not work the thing out at those quantities.

5077. The second system, I understand, was the system under which Contract 69 was taken—that is, the quantities and prices were set down, and the contractors were asked to tender, sending in their own prices? Yes.

5078. Under the third system the contractors were asked to tender at a uniform percentage below prices? Yes.

5079. *His Honor.*] It was a percentage system still? Yes.

5080. The second and third systems, I understand, both involve a percentage tendering? Yes.

5081. *Mr. Parkes.*] Under the old system there was always a check put upon contractors to prevent their dodging about with their schedules to their own advantage. For instance, the Government said “The quantities are not guaranteed as correct, and are merely for the guidance of tenderers, who may satisfy themselves as to their accuracy, which is not in any way guaranteed by the Government, and they are subject to omissions, deductions, or alterations.” They also have a check in the general conditions, in which they say—

If at any time whilst the works are in hand it shall be deemed expedient by the Engineer to order material or work of a different description to that specified, or to increase or diminish the dimensions or extent of any works to be done under this contract, or to alter their situation or vary the form or dimensions of any of the said works, or of any part thereof, or to make any deviation or to substitute one class of work for another, he shall have full power to do so, and to order and direct any such increase, diminution, alteration, deviation, or substitution, and the works involved in any such increase, alteration, deviation, or substitution, shall be executed by the contractor if of the class of works provided for in the schedule of prices, at such schedule prices; and no such increase, diminution, alteration, deviation, or substitution, of works shall in any way annul or set aside this contract, or extend the time for the completion thereof, unless the Minister shall see fit to grant such extension; but such additions or alterations shall be measured and paid for, or deducted from the contractor's account, as the case may require, according to the schedule of prices.

So that if the contractor has extravagantly high prices the Department can avail themselves of that and the other clause to prevent him from getting the best of the Government? They have done so in some cases; they did so at Rookwood.

5082. What contract was that? The Necropolis drainage. They knocked out a bridge in that case. It was in the contract. By knocking it out they put us to a great deal of cost in the cartage of the material. We relied upon the construction of the bridge as being a means of getting material from the railway station. We objected to that alteration, and we wrote a number of letters about it.

5083. Why did they take it out? On the score of economy.

5084. Because you had a good price for it? We had a fair price for it. I think that it was knocked out on the score of economy. Since then the Minister has given £100 to the Municipality of Rookwood to build this bridge. We put in a claim for extra cost of cartage, but we did not get it. Mr. Hickson decided that he could knock out one class of work and substitute another. We put three small brick abutments to carry some iron pipes across the creek, which were shown to be suspended under the bridge. We also put in a claim for loss of profit on the bridge, and that was disallowed.

5085. Have you any case where you have had £50 a yard for bluestone pitching of the value of 25s. a yard, and been allowed to receive payment for a larger quantity at the high rate? We never had anything like that. In our case, we had an even schedule as nearly as it could be made so.

5086. You made no effort to catch the Government? No.

5087. Would you expect to get such a high price as that I have named for such work? I should expect them to substitute something else as they have done in other cases.

5088. They had the power under the conditions of the contract to substitute something else? Yes; Mr. Hickson distinctly told me so. That was his decision.

5089. You would not expect to receive, in such a case, an increase from £600 to £1,875 so far as that particular item is concerned;—you would not expect to receive that amount of extra work at £50 a yard? Would you ever dream of receiving such an amount as an extra? Do you know of any case in which such an item has been increased threefold. I should consider that we were very lucky, but I should not object to take it. [*Vide Appendix No. 14.*]

5090. But, as a business man, you would not dream of getting it? No; I certainly should not.

5091. Do you think any contractor would expect to get it? I could not speak for others.

5092. Do you remember any case in which any firm of contractors have received kindly handling like this? I do not.

5093. Coming to excavations, in the price for excavations is it not the custom of contractors to tender for the timbering necessary to uphold them? The Department put down 2s. a cube foot for timbering, but the contractor would have regard to the nature of the ground. He would take the value of the work at so much a cube yard, and would put into that value so much for the timbering.

5094. It is only the roughest class of wood that is used? It is round timber.

5095. It is left in the ground, is it not? In some cases.

5096. It is looked upon as valueless? When it is taken out of the ground we do not look upon it as being of any value.

5097. *His Honor.*] As to its being left in the ground, I suppose that if it is to be left in the ground it has to be a good class of timber? Of course if it is left in the ground the contractor would be paid for it.

5098. And it would have to be a sound class of timber? It is ordinary round props.

- W. Gilliver.  
24 June, 1896.
5099. What I mean is this: when the contractor is allowed to leave the timber in the ground, the timber, as it were, forming part of the filling,—is there not a special provision that that timber shall be of a particular class, so that it may not count for nothing in the filling? In all cases the timber is subject to the approval of the departmental officers. If the timber were not good it would be rejected if the Department were paying for it.
5100. When you are timbering to support a drive, the timber is in some cases taken out altogether? Yes.
5101. And sometimes by the permission of the inspector or engineer it is left in? Yes. In some places it would be absolutely dangerous to take it out.
5102. And when it is left in what is done? The Department pay 2s. a foot for it.
5103. But will the Department ever allow timber to be left in if it be inferior timber intended originally to be removed? Bad timber would never be allowed to be put in in the first instance. The inspectors would look after that part of it—at least, that is my experience. I do not think any contractor would put in bad timber, because the risk of having the men hurt would be too great.
5104. *Mr. Parkes.*] The timber is part and parcel of the contractors' plant? It would be where you fix your own prices.
5105. It is only left in the drives for the convenience of the contractors? Not necessarily. In some places it is absolutely dangerous to take it out.
5106. But it will in time perish, will it not? I suppose it will.
5107. But cheap round hardwood scaffolding is better than pine, is it not;—it is more costly timber, and the harder it is the better the material for the purpose? They usually get sawn timber for the tunnelling, and round timber for the cap-pieces and props.
5108. It is generally included in the sum for excavation? It would be if the contractor were fixing his own prices.
5109. Have you ever had to build sewers where subducts were specified? Yes; but we have never put them in. We have never, under this Department, had to work in bad ground, necessitating the subducts. It has been hard ground.
5110. These subducts would not be included in the excavation items? No; I do not think so; 1s. 6d. or 2s. a yard run is allowed for them.
5111. Will you look at this clause:—

Subducts to be constructed, when decided on, along lines of tunnels and open trenches commencing on each length midway, or thereabouts, between two working shafts or faces, 33 inches below invert of main sewer, branches, &c., or as shall be directed at the time, and having a fall towards each working shaft or face, of such gradients as may be determined at the time, after the thickness of sewer-lining required for each length between shafts or faces has been ascertained and ordered. Subducts of 9 inches, or of a greater or less internal diameter, if directed, to be laid immediately underneath the timber floor of tunnel or open trench, or at sides of sewer, in hardwood boxes varying in size and dimensions as shown on drawing. Said boxes to be laid straight and true to levels decided upon, and the pipes to be laid therein, upon, and surrounded by, sandstone chippings and quarry refuse. Dry stone packing to be put over pipes, as specified in clause 21.

No doubt that clause comprises the whole of the subducts? Yes.

5112. It is supposed to be an individual item outside of ordinary excavation? Yes; but what would the schedule say in that case?
5113. Supposing we allow the excavation to go out, would 1d. a yard for subducts be sufficient to pay for them? Certainly not.
5114. Coming back to Contract 77, I want you to tell me what you know about that contract;—do you think there is any extra special method adopted of putting the compo in? I would not like to hazard an opinion. I have only seen the work casually in walking to and fro; I have never stopped to look at it, but as far as I have been able to see there is nothing special about it. It is a thing which we would tender for to-day or to-morrow if we could get the right to use the patent. If tenders were invited by the Department for that class of work, and we could obtain the right to use the patent, we would certainly tender.
5115. What do you consider the price of the compo.? The value of the particular class of work they are doing in Contract 77 works out at £1 11s. 2d. per cubic yard. I have given the thing some little consideration. I make out my estimate in this way:—I take 1,050 cubic yards of compo., with a gauge of 3 to 1, and I take the cement at 10s. a cask; and there would be 66 tons of iron fixed in position at £13 a ton. The cube yard works out in this way:—I take two casks of cement at 10s., that is £1; 1 cubic yard of sand at 4s.; water, 2d.; the centering, distributing the cost over the whole 1,050 cubic yards, I make 2s. 6d.; and I allow 4s. 6d. for labour; that brings out a total of £1 11s. 2d. for the compo. I then add 1½ cwt. of iron, at 16s. 3d. per cubic yard; also 10 per cent. profit, and 15 per cent. for patent rights, making a grand total of £2 19s. 11d. That is the price at which I should be prepared to take similar work.
5116. Your estimate includes the centering and all the contractor's plant? Yes.
5117. As a matter of fact, is not good bluestone concrete more costly than compo., taking the Department's own prices? £3 a yard is the usual price for special concrete which is used to put round man-hole covers. That is what we get. We have put special concrete round man-hole covers at that price, where in another case £50 a yard has been paid.
5118. Did you tender for contract 101? No. I was in Queensland when that was let.
5119. Did you ever do any work under the Queensland Government? Yes, for about twenty years.
5120. What system do they use there in their tendering? They give you the quantities, and you fix your own prices. They do not even guarantee the quantities. They make the contractors take the risk. You would be paid on the actual measurements at the prices they fix. They fix a price to arrive at the lump sum and to ascertain the lowest tender, but the quantities may be increased or diminished.
5121. Did you ever hear of that form of tendering being used to the disadvantage of the Government? Not to my knowledge.
5122. Is it not the universal system of tendering on the continent of Europe? I could not say.
5123. At all events, you never heard of engineers allowing the system to be used to the detriment of the Government in Queensland? I could not say that I did. I was principally managing works for others in Queensland. I was manager for five years for J. and A. Overend, and for six years for O'Rorke and M'Sharry. I do not know anything about contract work outside of the colonies. My experience is confined to Queensland and New South Wales.

5124. I suppose you have taken some notice of the construction of the Monier arch. In your opinion, as a contractor, is it a safe structure or not? I could not say. I should not like to say, because I do not know. I am not an engineer. I am a practical man, and I could not calculate the breaking strain and all that sort of thing.

5125. What is your experience of the effect of our climate upon constructions of that sort in compo.? I could not say.

5126. Have you had no experience of that sort of work? Very little. There is general talk among contractors, and perhaps they speak as they wish. They seem to think that the whole thing will collapse. I really do not know anything about it. I do not feel competent to express an opinion, and I should not like to hazard one. I should be prepared, as I said, to take the same class of work at £3 per yard, and pay the royalty of 15 per cent.

5127. That would include ironwork and everything? Everything.

5128. Have you looked into the cost of the Monier work in other respects? No. I have only passed by the job now and again. It is a little bit off for one contractor to go dodging about the work of another man. I would not do so on principle.

5129. About the North Shore contract—is that not one of the works in regard to which you complain that it was let without tender? Yes. We anticipated that the other two contracts which have since been let would be given to Carter, Gummow, & Co. in the same way.

5130. You wanted to put a stop to that? Yes. And that was why we made it one of our complaints to you when we waited upon you as a deputation.

5131. Was there any justification for giving that contract without tender? No. There could not be.

5132. Was the outfall made? It was not commenced.

5133. If there was time to call for tenders for a third contract there was plenty of time to call for tenders for 79A, the second contract? Yes. As one of the public of New South Wales, I think the Department made a big mistake in starting at the end of the sewer at which they did start. I think they started at the wrong end. If they had started at the outfall the sewerage works would have been bringing in a good revenue now. Hundreds of thousands of pounds have been expended upon sewerage, and until the outfall is built the sewers cannot be used. As soon as the sewers can be used I presume the people would be asked to lay a line of pipes for the connections, and in that case I presume persons would have to pay for the sewerage in just the same way as they would have to pay for water supply. Our sewers have been in course of construction for seven or eight years, and they are not in use yet, although some have been completed for about five years. Meantime the public has to pay interest on the money. Some of the sewers might have been working a long time ago if the Government had started at the lower end.

5134. Did you look into Contract 79A at all? No.

5135. I mean as to the prices? No. We tendered the other day for the job that Butcher Brothers got—a continuation of that contract.

5136. It was a similar work? Yes.

5137. An addition to that line of piping? Yes.

5138. What was your percentage below Carter, Gummow, & Co.'s contract for 79A? I did not know what their price was for 79A.

5139. What was the price below the Government estimate at which the tender was let? It was twenty-four per cent. above.

5140. That was the tender which was let for this third length? Yes. We were second.

5141. *Mr. Smith.*] Contract 79A was an extension of Contract 79? I understand that it was.

5142. It is not altogether an unusual thing for a contractor who has an original contract to take any extension of that contract? No; we have done it in one case.

5143. At Rookwood? Yes.

5144. You had an original contract there, and an extension of that contract was given to you without tenders being called? That is so.

5145. What was the amount of that extension? I remember that it came to about £6,000.

5146. What was the amount of the original contract? About £6,000, I think. I know that the two things panned out at between £12,000 and £13,000.

5147. As to Contract No. 107, I believe you wrote a letter to the Under Secretary for Public Works on 15th February, 1895? Yes.

5148. The document I hand you is a list of tenders opened on 13th February, two days before your letter was written? Yes; assuming the figures to be correct.

5149. You will see there a minute by Mr. Bagge, in which he recommends the acceptance of McSweeney's tender at 29 per cent. below the rates quoted in the schedule of quantities;—you will see that that minute is dated 15th February? Yes.

5150. I think if you refer further to the document you will see that the acceptance was recommended for confirmation by Mr. Hickson on 28th same month? Yes.

5151. You said, I think, that you did not receive an answer to your letter? Well, I received the usual acknowledgment of its receipt; that is all. But when we saw that McSweeney's tender had been accepted we were perfectly satisfied. We did not want any reply.

5152. As a matter of fact the acceptance of McSweeney's tender was recommended on the very day upon which you wrote your letter? It seems so.

5153. With regard to Contract 77, you sent in a tender 18 $\frac{3}{4}$ ths below schedule rates, and Carter, Gummow, & Co.'s tender was 28 $\frac{1}{2}$  below? I believe it was.

5154. There was 10 per cent. between you? Approximately, yes.

5155. You also sent in a tender for 117, did you not? Yes.

5156. I think your tender was 9.01 below schedule rates? Yes.

5157. So that comparing Contracts 77 and 117 there was 9 per cent. difference between your rates, taking things all round? That is not a fair way in which to put it. The aqueducts to be built under the Government plan in the case of 77 were very costly.

5158. But there was 9 per cent. difference between your two tenders? Yes; but you must take the surroundings into consideration. The mere figures are no guide.

5159. You said you had not seen much of the Monier arch work upon Contract 77, and that you did not intend to hazard an opinion about it? Quite so.

5160. You said you did not think there was any special work about it? I did.

5161.

W. Gilliver.  
24 June, 1896.

- W. Gilliver. 5161. Would you be astonished to hear that we had been told by a witness who has examined the work in connection with these Monier arches that there is very special work required, and that the compo, could be put in only in small quantities; that it is more like the weighing out of sugar than the construction of a public work? I should take that statement to be absurd. When a gauge of stuff is mixed and run up by the barrowload there is no weighing out of sugar about it; all that sort of thing is bunkum.
5162. You do not believe that story? No.
5163. You do not believe that the stuff has to be handled in a way different from the ordinary practice? There is a little more timbering required perhaps in the construction.
5164. But with regard to the mixing and handling of the compo.? There is nothing special at all in that.
5165. I suppose your estimate of £3 per yard for the compo. is based upon the assumption that there is nothing different in the mode of handling it? I have allowed 4s. 6d. for labour, and I think that is quite enough.
5166. But you base your estimate of £3 on the assumption that there is nothing special about the work? Yes. I have allowed 100 per cent. more for labour than would be allowed in the case of ordinary concrete.
5167. I believe you went to Mr. Parkes on the occasion of the deputation which has been referred to? Yes.
5168. That was after the acceptance of tenders for Contract 77? Yes.
5169. Which seems to have disturbed all you contractors? Yes; self-interest comes in, you see.
5170. Who went with you on that occasion—who were in the room? Altogether there were fourteen. I do not know that they were all there at that particular time now I come to think of it, but there were fourteen who mutually agreed that we should take that step in our endeavour to put a stop to that state of things by having it brought before the House.
5171. Who were in the room while you were there? Maddison, Ewing, Williams, and O'Neill. I am not quite sure whether one or two of the Butchers were there.
5172. Is there anyone else you can mention as far as your memory serves you? I think I have told you all who were there at that particular time.
5173. There were seven or eight, then? Yes, besides myself. There were about fourteen altogether who agreed that we should wait upon Mr. Parkes.
5174. But were they all there together? No, not at one time; but we have often met and discussed matters since then.
5175. I am referring now to this particular occasion? There were about ten there, I think, as far as my memory serves me. There may have been more.
5176. I think you said that the chief question brought forward was the acceptance of this lump-sum tender. That appears to have been the chief grievance? The grievance was this—that we as contractors wanted to be put on an equal footing at the tender-box.
5177. What do you mean by that? I mean that one contractor should not get any preference over another.
5178. But in what way—in what respect? As regards the sending in of a lump-sum tender.
5179. But by that time Contract 107 had been dealt with and McSweeney had got it? Yes.
5180. You knew that? Yes.
5181. Was there any other cause for making you think that you were not on an equal footing apart from the lump-sum tendering in the cases of Nos. 77 and 107. I want to know what it was which made you think that you were not on an equal footing? I have already told you of this particular firm tendering twice at a lump sum, and of one of their lump-sum tenders being accepted upon plans quite different from those upon which we tendered.
5182. But Contract 107 had been disposed of—Carter, Gummow, & Co. had not obtained the contract; McSweeney had obtained it? So you have told me.
5183. But you knew at the time the deputation waited upon Mr. Parkes that No. 107 had been let to McSweeney at schedule rates? Yes; I saw that in the papers.
5184. Therefore the lump-sum tender sent in by Carter, Gummow, & Co. had not been accepted by the Department? Not at that time.
5185. So that at the time you waited upon Mr. Parkes the only other cause for disturbance was the acceptance of the lump-sum tender in the case of Contract 77? Yes, and what might follow.
5186. Was there any existing fact beside that which was moving you at the time? One grievance of the other contractors was that Carter, Gummow, & Co. had received an undue preference in receiving three or four contracts without tendering at all for them, and they anticipated that the same firm might obtain contracts for which they have since had to tender—for instance, the one that Butcher Brothers got. That was not my grievance. I knew nothing about the North Sydney matter. You know of my letter, and I wrote in that letter what I meant.
5187. But the only fact which weighed with you at the time of the deputation was the acceptance of the lump-sum tender in Contract 77? With me individually, yes.
5188. What were the other concessions to this firm of contractors which you heard mentioned on the occasion of this deputation? There was the matter of £50 a yard for bluestone pitching.
5189. That was mentioned? Yes. They had a price in their contract for freestone pitching at 25s. a yard, but there was also £50 a yard for bluestone pitching, and the quantity in the case of the bluestone pitching was considerably increased. In other words, the firm had been spoonfed. There was no free-stone pitching put in.
5190. What contract was that upon? The Marrickville contract. That was one of the things which was brought before Mr. Parkes, although not by me, because I knew nothing about it.
5191. Do you know who it was who brought that matter before Mr. Parkes? I think it was one of the late partners of the firm.
5192. Of Carter, Gummow, & Co.? Yes. The late partners had a good deal to say—a good deal more than they had to say when they were giving evidence here I noticed.
5193. Are you referring now to one of the late partners who was examined here the other day? Yes.
5194. You mean Mr. Maddison or Mr. Ewing? I could not say which it was. But the matter has been common gossip among contractors and their friends, and among the engineers and merchants who had transactions with them.

5195. Was there anything else mentioned on this occasion in the way of concessions to Carter, Gummow, & Co.? Not that I can think of at this moment. They were talking away there for some time. I think I have told you all I know about it. W. Gilliver.  
24 June, 1896.
5196. You cannot remember any other specific thing being mentioned on that occasion by way of a concession to Messrs. Carter, Gummow, & Co.? A lot of things were mentioned.
5197. But can you remember any one of them besides the two you have named? I have told you several of the principal things.
5198. The principal thing was the acceptance of the lump-sum tender in the case of Contract 77? Yes.
5199. The other concession was the matter of the bluestone pitching in the Marrickville contract—that matter you say was mentioned by one of the late partners? Yes.
5200. What I want to know is whether any other specific thing was mentioned? Well, there were two branches to be constructed at North Shore, one of which Butcher Bros. got the other day.
5201. But tenders had not been sent in for that work at that time? If you look up the matter you will find that we tendered for it long before we saw Mr. Parkes.
5202. Had a tender not been accepted? I could not say. I know that we had tendered. Our tender was not the lowest, and the matter did not concern me very much.
5203. What were you afraid of in regard to that contract? That that section of the sewer might be given to this particular firm without their tendering for it.
5204. That is what you were afraid of? I was not, but the others were.
5205. Was there anything else mentioned in the way of concessions to Carter, Gummow, & Co.? Yes; there was the Johnstone's Creek matter.
5206. What was that? We were one of the tenderers for that job. Sixty or seventy of the unemployed went there and drained off the water. I think that matter was mentioned by Mr. Williams at the particular meeting I have been referring to.
5207. Can you remember whether any other grievance was mentioned? I cannot think of any other. We were discussing various matters there for some time. First one man and then the other was talking.
5208. But you can think of no more concessions? No.
5209. *Mr. Parkes.*] What about the substitution of the blasting for manual labour? That was also discussed.
5210. *Mr. Smith.*] You spoke on this occasion, I suppose? I did not monopolise all the time. I chipped in with the rest.
5211. I suppose you spoke more particularly with reference to Contract 77? Yes.
5212. Did you suggest any reason at all for this alleged concession on the part of the Government to Messrs. Carter, Gummow, & Co.? Certainly not. I give Carter, Gummow, & Co. credit for doing the best they can when they get a job. I was not concerned about what they did. I was concerned about putting them on an equal footing with us at the tender-box. I do not care if they made £50,000 out of their contract, once they had obtained it fairly.
5213. Did you suggest that there was any reason for the Department having accepted their lump-sum tender? No. As a matter of fact, I do not know of any reason. I know that it was done; that is all.
5214. You knew only that it had been done, and you wanted to have it stopped in the future? That is so.
5215. I suppose you did not suggest at all that this firm of contractors were identified with the Government in a most suspicious manner;—did you suggest anything of that kind? No.
5216. You did not suggest that they were identified with the Government? No.
5217. Did you hear anyone else there suggest it? No, I did not. I think every contractor would give the firm credit for doing the best they could for themselves. The only question with us was whether the Department would stand it.
5218. No suggestion of the kind I have stated was made at this meeting? No; I do not think so.
5219. If there had been any suggestion of that kind, you would have heard it? It might have been made, but I did not notice anything of the kind. There might have been a million and one things said, but I do not remember.
5220. *Mr. Gummow.*] As to Contract No. 77, had you not an equal chance of tendering with other persons? Yes, on the original plan—the plan supplied by the Department.
5221. Had you not a chance of putting in a plan for yourself? No, decidedly not.
5222. Why not? Because it had never been done.
5223. Had you not an opportunity to do it? Certainly not. I should have considered that it would be presumption on my part to do it.
5224. You may have thought that it would be informal, but had you not a chance of doing it? It never suggested itself to me.
5225. If it had suggested itself to you would you not have put in a tender? How could I put it in the tender-box—where was I to put the plan? Could I put it into the box? I suppose you would not expect me to put it into Mr. Darley's or Mr. Hickson's hands.
5226. You could have put it into the hands of the proper authorities, could you not? Who are the proper authorities?
5227. The Tender Board I suppose;—could you not have taken your plan to the Tender Board? Has it ever been done?
5228. The question is whether it was a thing which came within your idea of tendering? It had never been done, and I say so having been tendering continuously for seven years in all the Departments.
5229. You say you had no equal chance of tendering? I had under the original plan. If we had known that the Monier system was to be adopted we should have been prepared to tender for it also, putting up a cash deposit and not sureties.
5230. *Mr. Smith.*] And do the work as you have described? We have never failed in a job yet, and we have done a lot of second-hand ones that other persons have failed in. We have done some of the most difficult work in the Colony.
5231. *Mr. Gummow.*] In regard to your contract at Rookwood, you say there was an extension there of equal value to your original contract? It was better.
5232. Did you have any of your schedule rates altered for that extension? Yes.
5233. Were they improved or made less? There were some items in the extension for which we had no prices in the first contract. Those prices were agreed upon between the Department and myself. They would

W. Gilliver. would, I believe, at that time have been better prices than we should have got had public tenders been invited.

24 June, 1896.

5234. As a matter of fact, then, you did not disagree with the taking of the extension? No.
5235. I mean as a contractor? I will tell you how it happened. There was nothing in the thing to speak of, but we ourselves were there. We had our plant there, and it was a question of waiting while a tunnel was driven across the Parramatta Road. That would have taken us some months, and by taking on the extension we could finish Contracts No. 1 and No. 2 at about the same time.
5236. You took the extension? Yes; as a matter of fact, we asked for it.
5237. As to this second and third system of tendering under which the Government supplied quantities and prices in the one case, and in the other case prices only, does the altered system with no quantities make any difference to you in putting in your tenders? I do not mind our not being supplied with quantities.
5238. It does not affect your tendering? Not a great deal. Five years ago you could make £10,000 a year where you could not make £100 to-day through the altered system of tendering.
5239. I am referring now to the second and third systems under which the Government first put in quantities and prices and afterwards prices? I do not care a hang about the prices; I would just as soon tender lump sum as in any other way, without either prices or quantities.
5240. I am referring now to the difference between the second and third system;—does the alteration make any difference to you? Yes; I entirely disagree with it. It has knocked the contractors out altogether. We have been working three years, and have made absolutely nothing out of it. Before that we made £40,000 in three years. There is no more use for contractors now; the Department fixes the schedules, and fixes the rates at which we are to pay our men. The contractor now simply takes his bag over to the Treasury, takes his money out and hands it to the men; none of it sticks to our hands. There is nothing in it.
5241. I do not refer to the old system of tendering where the contractor put in prices—I am referring to the changes within the last two years or so, under which the Government first put in quantities and prices, and, lately, prices only? The fixing of prices in that way has killed contracting.
5242. *His Honor.*] But what is the difference between the two last systems—the percentage system giving quantities and prices, and the percentage system giving only prices and no quantities? It means that a contractor who is not able to take out quantities himself has to pay two guineas or so to a man who can do it.
5243. *Mr. Gummow.*] Will not a contractor, tendering under the first of these systems, take out his own quantities? Not necessarily.
5244. Would you rely upon the Government quantities? I have often tendered without taking the quantities out. We know where the sewer is, and the two chief items are excavation and concrete. If you get fair prices for them you do not care how the other things are.
5245. But do you not care whether the quantities of the Government are correct? Yes; we worked out quantities in the case where we objected to your lump-sum tender, and we found that we could tender at £20,000, although you tendered at £23,000.
5246. When you are trying to get a job, don't you go into the plans and specifications? No. I could make up a tender in half-an-hour. The quantities would not concern me if I saw the plans. We should look to the excavation and concrete as the leading features, and if the prices in the schedule for those things were fair the rest would be all right.
5247. But do you take out your own quantities? The quantities are put there, I presume, merely to arrive at a lump sum.
5248. But do the Government quantities affect you at all in making your tender, or do you take out your own quantities? In making out my tender I rarely take out quantities.
5249. But would you not wish to know what quantity of concrete, of brickwork, and of excavation there were in any given case? No; I should not go into that, and few contractors do. It really does not affect you. If you know that £3 a yard will pay for special bluestone concrete it does not matter whether they put in 300 yards or 3,000 yards.
5250. But if you had 300 yards of that concrete down at 60s., and 3,000 yards of it at 60s., do you mean to say it does not affect you whether there is 300 or 3,000 yards? So long as there is a fair profit it does not matter. The Department have decided that they can increase or diminish the quantities. I do not care myself if the sewer is 1 mile or 3 miles long so long as I know that the prices are good enough.
5251. I will assume that there are 10,000 yards of excavation at £10 a cubic yard in one contract, and that there are 1,000 yards of bluestone concrete at 20 shillings in another, would you tender on the same percentage for that contract as if there were only 1,000 yards of bluestone concrete at 20s.? At times you do; you have to do it.
5252. I am referring now to the making-up of your estimate of what percentage you will tender at above or below the schedule rates? You are entirely in the hands of the Department. They increase or diminish the quantities as the case may be. Contracting is really a game of chance when it is all over.
5253. You know that in a mile of tunnelling there will be a certain amount of excavation? They give the quantities at per foot run for tunnel excavation, so that there is no need to take it out.
5254. But you must multiply the section they give you by the length? Not necessarily.
5255. It is not necessary, you think, to take out quantities? In nine cases out of ten I do not do it.
5256. As to the subducts in the case of Contract 69, do you say that you would not expect to be paid for the excavation for the subducts under the schedule? I said I never put in any subducts.
5257. I am talking of this particular contract. The schedule at 2s. per lineal yard is not intended, I suppose, to cover the price of 6-in. pipe. Supposing the piping to cost 1s. 3d., would the extra 9d. cover the cost of the excavation? It might in soft ground, but it would not in solid rock.
5258. If subducts had been ordered in that case would you expect to be paid for the excavation in connection with those subducts? I never went into that matter. I have never done any of that work, and I do not know the value of it.
5259. *His Honor.*] As a matter of fact subduct work is not done round about Sydney? Not that I know of.
5260. *Mr. Gummow.*] As to the timber for the excavation, it is put down at 1d. per foot;—you said in your evidence, I think, that you considered the cost of the timber in taking out the cost of the excavation? Yes, if I can fix my own prices.

5261. Would 1d. a foot be a foolish price to put down for timber if you had the price of the excavation as well? You would have to be guided entirely by knowing, in the first instance, whether you would have to use much of it or not. If the ground were fairly good standing ground there would be nothing in the timber one way or the other. W. Gilliver.  
24 June, 1896.
5262. You mean that no timber would be put in? No. We had 1d. a foot for timber at Rookwood.
5263. If the ground were soft would you require timber? Yes.
5264. Well then, supposing you had a price for the excavation? I should take the value of the timbering, and put it into the excavation.
5265. As to the Rookwood contract, had you not other claims in connection with it—in connection with the pipe joints, for instance? Yes.
5266. Did you get what you claimed in that case? Yes.
5267. Do you know if any other contractors got such a thing? I do not know.
5268. Do you consider when you settled up your claim with Mr. Hickson that it had been fairly balanced for and against the contractor? It was fairly balanced by Mr. Davis, but not by Mr. Hickson. He simply wiped the thing out. Mr. Davis dealt with the claim as far as he could, and then he brought us into Mr. Hickson. We were not there two minutes. He said, "Disallowed! Are there any more questions, Mr. Davis?" And then we were shown out. I should have liked to give him my version of the matter, but he had gone into it, and decided what he would do. As regards the omission of the bridge in that contract, it has been decided in Queensland that the Department cannot alter the character of the work.
5269. You think you were unfairly treated because the bridge was shown upon the plans and Mr. Hickson did not give it to you? Most undoubtedly. The omission of the bridge cut off our right-of-way for the getting of material.
5270. Can you give us any further names of the fourteen contractors who you say agreed that certain action should be taken—who agreed that they had been badly used? I did not say that they had been badly used, but we wanted to stop you people from getting too far ahead of us. It was a question of self-interest. I do not blame you for getting ahead of us, but we wanted to bring you back to the mark if we could.
5271. You wrote a letter to the Under Secretary for Public Works? Yes.
5272. It was mutually agreed that you should do so? Yes.
5273. Can you name the contractors who agreed that you should do so? The contractors that I have already mentioned. The thing was generally discussed at the Public Works Office.
5274. You have named eight or nine of them? Yes. In addition to those I have named, there were Crosby and others—in fact, pretty well all the small contractors. There are three contractors who are not on a footing with us—Mr. Sweeney, Carter, Gummow, & Co., and Ahearne.
5275. What about Carson? He is engaged upon a railway. The balance present would be the small fry contractors.
5276. The rest did not bother? No; they were not with the deputation.
5277. *Mr. Parkes.*] In answer to Mr. Smith, you said that there were no suspicious circumstances brought up at the meeting of contractors which deserved inquiry;—do you mean to say that suspicious circumstances were not put before me? Pretty well every man had a grievance.
5278. Was any comment made upon Mr. Hickson, jun.'s, connection with the firm? Yes; it was spoken of.
5279. Have you read my first speech in Parliament, delivered in October last;—have you read the *Hansard* report of the speech? No, I cannot say that I have.
5280. Do you remember a written statement being given to me containing certain matters? I think I do.
5281. Will you read the passage marked in the *Hansard* I now hand you? Yes.
- 5281½. Does not that fairly represent what was said to me at that meeting? Yes; it does.
5282. Was not one of the complaints which was endorsed by all the contractors this: That if they had rigged a schedule, as it is called, they had to get justice, that is, if they had too much upon one item that item was pulled down; whereas if Carter, Gummow, & Co. rigged their schedules they were paid by the Department upon their rigging, although it might be very glaring? Yes, that was spoken of, but I do not know by whom.
5283. Was it not reported to me that the prices for guttering and gadding work were infinitely cheaper than blasting on certain figures given, but that in Carter, Gummow, & Co.'s case there was a substitution made of blasting for manual labour, which was not allowed to any of the other contractors? Yes; but it is absurd to say that you can do manual labour as cheaply as blasting. The Department itself makes a difference of from 15s. to £1 a yard between the two things.
5284. It was represented to me that other contractors could not get that concession? Yes; a thousand and one things were spoken of.
- 5284½. Innumerable things of this nature were spoken of; some schedules were taken, and the matter was gone into fully, and innumerable proofs were brought to bear that concessions were given to Messrs. Carter, Gummow, & Co. in fixing up amounts in their final payments which ought not to have been in those final payments? Just so.
5285. *Mr. Smith.*] I think you said just now, in answer to Mr. Parkes, that a written statement was handed in to him by the deputation? I remember a paper being passed from some one to Mr. Parkes, but what was in it I do not know. I know, as a matter of fact, that Maddison told Mr. Parkes that Gillan had told him that a telegram had been sent by Mr. Carter to Mr. Gummow to the effect that young Mr. Hickson was to be taken into the firm at any price. That I will swear.
5286. Maddison said that at this meeting? Yes, before all hands.
5287. Was there any other reference made at this meeting to Mr. Hickson, jun., by anyone else? His name was freely discussed. It was looked upon as a great advantage to have him working for the firm, I suppose.
5288. Was anything said at the meeting of contractors to which you referred as to his being a partner—was anything of that kind said? No, I do not think so.
5289. When reference was made to the telegram was anything said about Mr. Hickson, jun., being taken into partnership? No; the matter was not discussed. I do not think anyone knew anything about it.
5290. With the exception of Mr. Maddison's statement? Yes; that was what he had been told by Gillan. Mr. Ewing did not seem to know whether Mr. Hickson, jun., was working for the firm or not.
5291. *Mr. Parkes.*] Was not a statement made to me very definitely about a conversation between Ewing, Maddison, and Carter? Yes, a conversation outside of the Bank of New Zealand. 5292.

- W. Gilliver. 5292. *His Honor.*] You saw a piece of paper handed to Mr. Parkes, but what it was you do not know?  
 24 June, 1896. No. I think Mr. Williams handed a piece of paper to him. Now I come to think of it I am quite clear about that.
5293. Did you see the contents of the paper? No; I do not know the contents.
5294. You did not hear it read? No.
5295. *Mr. Gummow.*] If Mr. Maddison said he was not at the meeting to which you have referred, would that be true? He would be telling a deliberate lie if he said so.
5296. *His Honor.*] There were, I believe, a first and second deputation to Mr. Parkes;—did the things to which you have referred occur the first time Mr. Parkes was interviewed on the subject, or the second time? I think it was the first time, but I could not be positive. I know that Maddison had been there more than once. I have met him there more than once.
5297. *Mr. Gummow.*] Was Mr. Ewing there? He has been there.
5298. Was he there when you were there with Mr. Maddison? I could not say, but on one occasion I know they were both there.
5299. With eight or nine others? Not at that time, I think.
5300. Were you present when Mr. Ewing and Mr. Maddison were there together? How could I say anything about it if I were not present?
5301. Upon this particular occasion to which you have referred, was Mr. Ewing there? I do not know whether he was there at that time or not. Mr. Williams was there, I know, and I think Bob and Sam Butcher were also there.
5302. But you could not say definitely whether at the deputation you have spoken of Mr. Ewing and Mr. Maddison were present together with yourself and others? No, I could not say definitely. I know that about fourteen were to have met there, and about ten turned up.
5303. As to the North Shore contract, you were one of those who tendered for that work? Yes.
5304. What was your tender? They beat us by 1 per cent.
5305. Was that above or below schedule rates? Above.
5306. Did you not say before in mistake that you were below the schedule rates? I could not say.
5307. As to the special bluestone concrete, do you know what it consists of? 5, 3, and 2, as far as my memory serves me. I have not done much of it except round manhole-covers.
5308. Suppose it is 7, 3, 2, would that be as good as material as 5, 3, and 2? No; I should not think it would be.

FRIDAY, 26 JUNE, 1896.

John Carter, recalled, sworn, and further examined:—

- J. Carter. 5309. *His Honor.*] With reference to Mr. Reid's employment—between what dates was he employed by you, and on what contract? Probably from 1890 to 1891 up to the beginning of 1896—during the last five or six years.  
 26 June, 1896.
5310. Was he upon all the contracts you were carrying out during that time, or was he only on some of them? Only on some.
5311. Can you say which he was employed on? 79, 79A, 65, and 53. I think that is all.
5312. There may be some more? Sometimes he was sent from one to another temporarily, but I think I have given you almost the entire number of the contracts he was on.
5313. During that time what was the position he held under the contractors? He was a sort of working manager. He would be always there in case we were not there. He had to see that the work was set out and that the men were kept employed. He had to look after the plasterers and concreters and to see that they had material, and so on. He was a sort of foreman manager.
5314. During the whole of the time did you work as a contractor directly, or did you employ sub-contractors? Sub-contractors for the shafts and tunnels. That is the usual practice.
5315. In what position did Reid stand as to the sub-contractors? He measured their work up and saw after their lines and levels. If anything went wrong he would report it to us and to the Government engineer.
5316. Had he to see that the sub-contractors carried out their work properly? Yes, so far as the proper levels and lines were concerned.
5317. As to the brickwork and concrete, was that sublet? No, that was all day-work.
5318. It was only the driving and sinking that was sublet? Yes.
5319. Then as to the work done by the principal contractors—what was his duty as to the brickwork and the concrete? He exercised a general supervision over it. He was what you would call an overlooking foreman. I do not know whether I can make it plainer than that to your Honor.
5320. What salary did he receive? His salary varied. I think he started at £2 10s. and went up to £4. I know that I raised his salary once or twice. I know that he received nothing lower than £2 10s. and nothing higher than £4.
5321. When did he leave your employ? Three or four months ago.
5322. How came he to leave—under what circumstances was it? The cessation of work. We had no more need for his services. He practically received six or eight months' notice. I often discussed the matter with him, he being an old servant. I told him that after the completion of the North Shore work there seemed no possibility of further employment by us, and that he had better turn round and look out for himself. I asked him more than once if he had done so. He knew for six or eight months before he left that he would have to go as soon as the North Shore work was completed.
5323. Did you give him a certificate or any reference on his leaving? I did not. I supposed he would be seeking employment among the same class of employer, and that being so, he could get a personal reference at any time. He did not ask for a written reference, and it did not occur to me to give him one.
5324. There was no cause for his leaving your employment on account of misconduct or failure to do his work properly? No; it was simply from a cessation of work.
5325. You were going on with other contracts shortly afterwards? The work for us had been reduced to a great extent by the Government assuming the responsibility for the lines and levels. Besides that, Mr. Gummow and myself could not afford to be quite as extravagant in the management as we were a year or two ago, when work was more constant.

J. Carter.  
26 June, 1896.

5326. It was the need for retrenchment, then, that induced you to dismiss Reid? Yes.
- 5326½. How did he do his work while he was in your employment? All right so far as I know, or I should not have kept him. Of course, he had his faults, like everyone else.
5327. To what faults do you refer? He occasionally took a little more liquor than was good for him, but not during working hours. I can honestly say that it was only on very rare occasions that I saw him in that state. That was the only failing he had as far as I know.
5328. Did that cause him to come on to the works in the morning unfit for the proper discharge of his duties? I never saw him unfit for, or neglecting, his work in any way. I think that on the whole he did his duty very well indeed. Otherwise we should not have kept him.
5329. As to the mode of carrying on the work, what instructions did you give Reid? No instructions. He was broken in originally five or six years ago, and then he received some instructions, but what they were I could not say. He was taken round the works and practically taught by the supervising partner, but, as far as I am concerned, I do not know anything as to his actual instructions.
5330. Who broke him in? Mr. Snodgrass.
5331. Had he instructions to economise material as much as possible? No; there was always plenty of material.
5332. You have heard the evidence given by Dawson and Chiene having reference, to a certain extent, to the way in which Reid was causing work to be done—apparently, in your interests, saving material at the expense of good work;—what do you say to that? Personally, I know nothing of it. Moreover I do not believe it.
5333. Did you at any time know or suspect that Reid was causing work to be scamped—that he was allowing it to be scamped? No.
5334. *Mr. Smith.*] You was here the other day when Chiene was examined, and you heard what he said as to what Jack Reid had told him;—you heard him say, “He told me that Carter paid some of the inspectors”? I heard of that for the first time the other morning.
5335. Is there any truth whatever in the statement, if it were made, that you had paid any of the inspectors? There is no truth in the expression “paid”; there is no truth in the statement that the men were “paid” in the ordinary sense.
5336. Eyre, I believe, was one of the inspectors for the Government upon the particular contract referred to? Yes; he was one of them. There were half a dozen or, perhaps, seven or eight more.
5337. Did you ever make any payment to him? Never.
5338. Never in your life? Never.
5339. *Mr. Gummow.*] With regard to your paying money to inspectors, have you ever given anything at all to a man named Corpe? Yes.
5340. In what way? As a matter of charity.
5341. Was that when he was on the works, or after he had left the works? Both, I think. I should not like to say that I had not given money to him while he was on the works; he was on and off in a very bad state of health.
5342. What was the matter with him? He was dying of consumption.
5343. Did you pay his expenses to some convalescent hospital beyond Liverpool? Yes, to a convalescent home. I paid his expenses up or down—I do not know which.
5344. Did you not afterwards pay something towards his funeral expenses? Yes.
5345. Did you ever contribute to a subscription list got up by the inspectors for his benefit? Yes; I gave something to the inspectors.
5346. To what inspector was it, do you remember? No; I do not remember. It may have been Tudgay, Husband, or any of them on the Marrickville contract.
5347. You gave this money to the inspectors on Corpe’s account? Yes.
5348. Do you know if he ever got it? I could not say.
5349. Did you ever contribute to any other subscription-list got up for the inspectors? Yes.
5350. Can you remember any particular list;—can you remember any particular inspector for whom another list was made up? Yes; Tom White.
5351. What happened to him? He died.
5352. The inspectors got up a subscription list for him, to which the firm contributed? Yes.
5353. Do you remember any other subscription list to which you contributed—any other list, I mean, got up by the inspectors? I do not remember any other.
5354. You do not know of any other? There were always subscription lists knocking about the works. They were always getting up subscription lists when an inspector died or was ill, or sometimes when a man died or was ill.
5355. Almost every day lists were got up for either men or inspectors connected with the work? Yes; that is a fact.
5356. You heard Chiene’s evidence? Yes.
5357. You probably heard him say that you sent for him to go to North Shore, and that you there gave him half a sovereign, and undertook to pay his baker’s bill for three months;—did you send for him? No, I did not.
5358. That is untrue? Quite untrue.
5359. How did you happen to know that he was in a bad state if you did not send for him? I saw him with a subscription list on the Annandale contract on pay-day.
5360. For whom was the list? For himself.
5361. What did you say to him? I saw him in the yard. I had not seen him for a year or more to speak to—perhaps two years. He looked in a very bad way, and I said, “Halloa! Chiene, what are you doing here?” He said, “Well, I am very hard up, Mr. Carter. I am here with a subscription list for myself.”
5362. What did you say to that? I said I was sorry to see him hard up. I said, “I am in a hurry now. I do not like to see an old employee of ours in such straits. You had better come over to North Shore to see me.”
5363. What did you undertake to do at that time? I guaranteed his baker’s bill for three months.
5364. Did you give him half-sovereign? I think I did give him something, but I cannot think at this moment whether it was a sovereign or a half-sovereign.

- J. Carter. 5365. Then it is not a fact that you sent for him to go to you? No.  
 5366. It was merely by chance that you met him at Annandale and made this offer to him? Yes.  
 26 June, 1896. 5367. Your seeing him was not arranged or premeditated on your part? No; to tell you the truth I had forgotten his existence until I saw him at Annandale.  
 5368. With reference to Reid's first employment by you;—how did he first come to get into your employment? He was brought in by Mr. Snodgrass.  
 5369. Was he a personal friend of Mr. Snodgrass? Yes.  
 5370. It was Mr. Snodgrass who gave him a start? Yes; I had nothing to do with it.  
 5371. Did you ever hear about Reid grumbling about his pay not being large enough? No.  
 5372. Did he ever ask you for increased pay? Never.  
 5373. Did you give him a bonus or Christmas-box or anything like that? Yes; repeatedly.  
 5374. In addition to his pay? Yes; every Christmas.  
 5375. With regard to his leaving the firm;—did he leave before 79A was finished, or was that completed? It was completed.  
 5376. Do you know whether he had anything to do with No. 69? Not with the actual working of it.  
 5377. Did he make out any of the pay-sheets of No. 69? Yes.  
 5378. Was 69 completed when he left? Yes.  
 5379. Had he anything to do with Contracts 77 and 118? Nothing.  
 5380. During Mr. Reid's employment by the firm within the last two years, was I in Sydney to assist the firm in any way or was I absent? You were here about half the time. You returned to Sydney early last year, and you have been assisting the firm ever since.  
 5381. Had I any other duties to perform when I returned;—had I any other contracts to look after? Yes; there was the Adelaide work.  
 5382. Was it necessary to keep on Mr. Reid to assist us with other contracts after we had finished 79 A? No.  
 5383. Our work was sufficiently reduced in quantity to admit of one of the partners looking after it? Yes. That was the reason Reid was retrenched.  
 5384. Coming back to the pay-sheets;—did Reid make up any sheets in respect of Contracts 79 or 79 A? Yes.  
 5385. And he made them up for 65 and 69? Yes.  
 5386. Did he make them up for 77 and 118? No.  
 5387. You are given to gambling are you not? No; I am not.  
 5388. To making wagers I mean? In a small way, yes.  
 5389. Do you remember making a wager of half-a-sov. at North Shore five or six years ago in connection with some pipes which were being laid? Yes; I remember it, not from the making of it, but from the occasion.  
 5390. You paid the man;—he beat you did he not? Yes; I paid him.  
 5391. Were the pipes decently laid? I believe so.  
 5392. But don't you know it to be the fact that they were? Yes. I think Mr. Davis saw them, and complimented the man upon the way in which they had been laid.  
 5393. He was a specially good man at pipe-laying? Yes; he was what we term a champion pipe-layer.  
 5394. Before I was connected with you do you remember telling me about a splendid pipe-layer you had? Yes. It was a matter of common talk that we had the best pipe-layer in the Colony.  
 5395. You prided yourself upon having a tip-top man in that line? Yes.  
 5396. *Mr. Parkes.*] How many Government Inspectors had you on your Glebe job? There were half-a-dozen, perhaps more.  
 5397. How many were there on Contract 69? Probably the same number.  
 5398. Half-a-dozen on each? Yes. They changed about very much. They would be there perhaps two, three, or fourth, months, and then they would be sent away and someone else would take their place. I should say that the average would be four at Marrickville and perhaps five or six at the Glebe.  
 5399. *His Honor.*] Do you mean that a number of inspectors were inspecting the work at the same time? Yes.  
 5400. *Mr. Parkes.*] You said in answer to Mr. Smith that you did not pay Inspector Eyre,—that you objected to the use of the expression "paid";—what did you mean? I meant that "paid" was the wrong expression to use. I think I was referring at the time to Inspector Corpe. Mr. Smith had referred to Mr. Chiene's evidence to the effect that I had paid inspectors, and I objected to the expression "paid." I did not deny that I had given the inspectors money, because, as I have already stated, I did so; but I never paid them.  
 5401. Did you give Inspector Eyre money for any purpose? No.  
 5402. For no purpose at all? As far as I am aware he never brought a subscription list to me, although there were half-a-dozen lists out at various times.  
 5403. *His Honor.*] These lists would often be for men as well as for inspectors? Yes. The men get consumption and all sorts of things, and naturally enough they would come to us for assistance.  
 5404. You do not mean to imply that the inspectors were, as a rule, dilapidated men, who were sent on to the work to die? No; but some of them must die. A great number of men are employed, and it is a common thing on all contracts when a death or anything like that occurs for a subscription list to be got up. At least that has been my experience.  
 5405. *Mr. Gummow.*] As to guttering and gadding, are these subscriptions not in many cases for men who have been employed upon guttering and gadding work under your contracts, or on sewerage contracts? Yes.  
 5406. As a rule, are they not the men who have gone into consumption through the dust arising from their guttering and gadding work in the tunnels? Yes.  
 5407. The lists in some cases have been for men who have become diseased from that cause? Yes.  
 5408. Have you not known a number of cases in which men have died as the result of sickness arising from that cause? Yes. That is one of my grievances against the Department. I have always said that I wished to put a stop to that work.  
 5409. *His Honor.*] What is your grievance? My grievance is that the Department have tried on more than one occasion to compel contractors—to put it strongly—to murder men who have to do this tunnel work

work by ordering guttering and gadding. I have felt very strongly on the subject; in fact, I have always done so.

J. Carter.  
26 June, 1896.

5410. Did you expostulate with the Department? Yes.

5411. Will you describe the operation of guttering and gadding? I am not a practical man, but I think I understand the work in this case. Take a tunnel 3 ft. 3 in. x 2 ft. 2 in. A man would have to crouch down on his hands and knees with a short pick in one hand and with a short hammer in the other, and he is constantly battering away at the rock, cutting it away. Every blow he strikes brings out a certain quantity of dust.

5412. *Mr. Parkes.*] Is not that the case with the avocation of the ordinary stonemason? He is in the open air. In less than three months any ordinary miner would be incapacitated by working at guttering and gadding in these tunnels. The illness they contract is from the inhalation of the dust. Only this morning, on the wharf, a man asked me if I could find him light employment as he was going the way of a number of other men who had been doing the work. He told me that he had not done more than a month's guttering and gadding in his life. Nevertheless, he had contracted the disease.

5413. *His Honor.*] Do they not wear respirators? They have tried all that sort of thing, and it has been found of no use. They either can't or won't wear the things. Sometimes they are in 300 or 400 feet, guttering and gadding. Air is blown in, and the particles of dust are constantly blowing round about the face of the work. Sometimes the men are working in steamy damp atmosphere. I know at least of thirty men who have been practically killed through guttering and gadding in the Castlereagh-street job—the only contract where it was carried out.

5414. The wages you pay for that work are higher than the wages paid for ordinary blasting? Yes; the men are paid 9s. or 10s. a day. I remember that in the case of the North Shore contract, where we were asked to gutter and gad, I expostulated, and I have brought up the subject repeatedly since. I think it is a most preposterous thing that we should be asked to do that work.

5415. In deep-bedded sandstone, upon (say) Contract 79, by adopting guttering and gadding, how many feet a day could you do? It would not be feet; it would be inches.

5416. A day? Yes; that is my opinion. You must take it for what is worth. It would not be more than a foot in any case.

5417. At what rate is blasting work done? In ordinary cases, I suppose about 16 or 18 feet a week.

5418. *Mr. Gummow.*] In the cases of the men who have been injured by the guttering and gadding work, were they healthy men before they started? They have been some of the finest men in the Colony.

5419. A good stamp of men? Yes; you cannot get them now.

5420. *Mr. Parkes.*] Was not this letter sent to the Government offices by the Secretary of the Miners' Association:—

Having been requested by my Association to write to the Works Department to obtain particulars whether there is any provision made for miners being provided with air, I have done so through the Secretary of the Trades Hall, thinking it would have more effect, but up to the present it is nil.

Although we are a registered association, up to the present we are not recognised by the Board of Conciliation and of Arbitration, though we are looking forward to it, as in all probability we may be the first to use that Board, us being engaged on Government contracts, and our case is a calamity. I urge upon you to act on our behalf at once. *Re* this information, our general meeting is next Saturday, 30th instant.

My reason for being so urgent is this—our men are dying off so fast. I have to report another death no later than last Tuesday. We sent two to Victoria to benefit their health. I am expecting to hear of their death every day, as their case is hopeless. One of our members came to me to-day. He says, "This is terrible; I am dying—lingering in misery"; has not been able to work this six months; a walking skeleton. We have always a large percentage to support out of our pittance, which, God knows, is only an average of 5s. per day. Out of this our fellows subscribe manfully. We are sure our turn is not far off. There is no man following this work who can live long; we all feel the effects—a husky cough, and galloping consumption follows, and our end is not far off. When we apply to the hospital we are sent to Little Bay as incurable. We have to rush smoke and foul air and dust, and work in unnatural positions to obtain even that average wage. I have pay-sheets to prove my statements, and a glance at my books may prove a death-rate that would not be believed—that is 10 per cent.—the result of us rushing this foul air and not being able to eat during working-hours. Our wives has to nurse us and bathe our aching heads at night, as we are at times almost lunatics when we ought to be resting. Our limbs weaken, and we can no longer work. We are forced to accept this death or starve our wives and children, and we do accept death to obtain them bread. There is terrible suffering amongst our members. They are willing to work, but the work is shut down from them. Although the Works Department let the contracts, they are powerless to compel them to employ labour. The North Shore underground sewerage job, Messrs. Carter & Co., has kept their shafts idle for weeks past. Men who sunk the shafts—some as deep as 250 feet odd—has been forced to fill the ranks of the unemployed. They are actually starving us into a death price. Up to the present we have never been provided with air; what air we have had we had to provide ourselves; so hoping you will take steps on our behalf.

—? That is an utterly untrue statement.

5421. Were these men not doing blasting work? Certainly.

5422. Is it not the fact that blasting work is dangerous, and that guttering and gadding work is not so dangerous? That is not true in the least.

5423. *Mr. Gummow.*] Did you know of this letter before you saw it in the printed papers;—did you make any reply to it? Not to my knowledge.

5424. Was any action taken by the Department in connection with it? I see by the reports that the Department made an investigation, and it was found that air was being supplied.

5425. Did they discover that you were paying 5s. per day to your men? They did not.

5426. Did they discover, on the other hand, that you were paying nearly 15s.? Yes.

5427. These statements, then, are utterly untrue? Yes.

5428. *Mr. Parkes.*] In the case of sub-let contracts, have the miners to find all their own materials, tools, and everything? No; they are provided with a air-blowing plant, with tools, and with everything they require except explosives.

James Mitchell recalled and further examined:—

5429. *Mr. Parkes.*] In the return you handed in to His Honor a few days ago, there is an absence of sundry payments—I think about six of them in all; one is on 22nd January, 1892, £1,668 13s. 11d.; that was paid to Carter & Co., and is not in your list; then there is a payment on 19th February of £1,208 6s. 1d.; on 20th June, £1,681 15s. 5d.; on 21st February, 1893, of £4 19s. 10d.; on 24th March, 1896, of £100; and on 31st March, £159 17s. 5d.;—can you account for these amounts not appearing on your return? If they were advances upon the firm's contracts they should appear in the list.

J. Mitchell.  
26 June, 1896.

- J. Mitchell. 5430. Could you find out upon what the advances were made? Yes; the whole of the payments in this return are payments in advance.  
 26 June, 1896. 5431. But payments I suppose for any purpose whatever would appear in your accounts at the Auditor-General's Office? Yes.  
 5432. Even to a penny? Yes.  
 5433. Could an officer of the Department issue cheques upon the Government Banking account without its appearing in the Auditor-General's accounts? No.  
 5434. There is no account upon which an officer of the Department could issue cheques without the amounts appearing in your books? I do not think I am in a position to answer that.  
 5435. Supposing an officer of the Department issued a cheque upon any account—call it a contingency account—could not that item appear in the Auditor-General's accounts? It should.  
 5436. Everything in connection with the public expenditure should appear there? Yes.  
 5437. Will you take this return which you have handed in and supply us later on with an explanation concerning the amounts which are wanting? Yes.

John Reid sworn and examined:—

- J. Reid. 5438. *His Honor.*] What is your occupation? I hardly know what it is at the present time. I was a manager for Carter & Co.  
 26 June, 1886. 5439. Before that what work were you doing? I was a labourer before that.  
 5440. When did you enter into their service? As manager, about seven years ago.  
 5441. You do not remember the date upon which you went into their service? No, I can only remember that it is about seven years ago.  
 5442. Did you remain continuously in their service until you finally left? Until about three months ago.  
 5443. Receiving various rates of pay? Yes.  
 5444. Between what amounts? £2 10s. and £4 a week.  
 5445. During that time what were your duties? My duties were to carry out one contract which they had, and to make out pay-sheets for several other contracts which they had in hand at the time.  
 5446. When you say that you carried a contract out, what do you desire to convey? I had to see that the work was carried out. I was in charge of the job.  
 5447. Do you mean that you were in charge while the contractors were away—perhaps away from Sydney altogether? Yes.  
 5448. And when the contractors were about Sydney, did you always have charge of this one contract? Yes, pretty well always.  
 5449. Upon how many contracts altogether were you employed;—do you remember the number? I think on about four or five.  
 5450. What were the numbers of those contracts? I cannot remember the numbers, but I can give you the situations. One was at Woolloomooloo, one was at the Glebe, and another was at Waverley. Then there were the two contracts at North Shore, 79 and 79 A.  
 5451. Any others? No others.  
 5452. On no contract at Marrickville or Annandale? No.  
 5453. During this time what instructions were given to you as to the way in which you were to see the work done? I was given the specifications and plans, and told to carry the work out.  
 5454. In what way? According to the specification and plans.  
 5455. What were you told as to the material;—were you told to save the material as much as possible? Certainly not.  
 5456. I mean as to the gauging of the material for the concrete and the mixing of the concrete? I had no orders to that effect at all.  
 5457. To what effect do you mean? I mean with a view to save the stuff.  
 5458. I suppose you have seen the newspapers lately? I have read the reports of this Commission in the daily newspapers.  
 5459. Did you see the evidence of Dawson? I saw a report of it in the morning newspapers.  
 5460. Did you see some statements in which your name was mentioned? Yes.  
 5461. Did you see his evidence to the effect that in putting in the lining of the tunnel upon Contract 79 and 79A he left a number of defective places, some especially defective? I saw that some places were left, but I do not know about special places.  
 5462. I mean some which were more seriously defective than the others? Yes; I saw that there were bad places.  
 5463. That there were some between shafts 12 and 13? Yes.  
 5464. Were you in charge of the contract at the time that Dawson was said to have done this bad work? Yes.  
 5465. As a matter of fact the work was in some cases done in the way in which he described it? Undoubtedly.  
 5466. What do you know as to the way in which Dawson did his work; take this particular section to begin with? I always took him to be a good labourer; I always put him down as a man who would do his work properly.  
 5467. You are aware of the fact that Dawson swears that it was through your instructions to save material that he did the work in the way he did? I have heard so.  
 5468. What have you to say to that? It is a deliberate falsehood.  
 5469. Will you positively swear that you never allowed Dawson to leave these vacant spaces between the top of the drive and the brickwork; will you swear that you do not know of their having been left? I will swear that positively; I will swear that I did not know anything about it.  
 5470. Do you swear that you did not know that the material was going in in the way in which it did go in? I did not know of it.  
 5471. You did not know of it at all? I swear that I did not.  
 5472. Did you not suspect it? No.  
 5473. You know the size of the drive, because you went through it? I do not know the size of that particular part of it although I have been through it.  
 5474. You know that the drive has been 'blasted out and that consequently there will be a good deal of filling which will have to be put in between the lining and the top of the drive? Yes. 5475.

J. Reid.  
26 June, 1896.

5475. You saw a quantity of cement being used and also a quantity of metal? I did not notice particularly that part of the work, but in passing by I saw the men using the metal and cement. I could not say in what quantities.
5476. Did it not strike you that there was not the proper quantity of cement going in? No; it would take a good deal more than one man to watch that.
5477. You say you have known Dawson for some time? Yes.
5478. For how long? He has worked for the firm for several years—for the last four years.
5479. Have you ever had occasion to question the way in which he did his work? Never on any occasion.
5480. There was a man named Hansen working there at the same time? Yes.
5481. You know that his work was questioned by the inspector on one occasion? Yes.
5482. Had you had occasion to find fault with Hansen's work before then? Not before then.
5483. Do you not know that his work was found fault with on one or two occasions before the occasion on which he was dismissed? No, it was never reported to me.
5484. Did you know nothing at all about it? Not a word.
5485. Do you swear positively that you had no idea whatever that bad work was being done? None whatever.
5486. Where were you living at the time? I was living in Sutherland-street, North Sydney, at the time.
5487. What would you be doing during the time work was going on;—how would you be employed? There was a good deal of work going on on the job. There was the concrete work and the plastering work. I had to see that all the work was being properly carried out.
5488. What length of work had you under your charge? About 60 chains, I think.
5489. What you specially had under your charge was the lining? No; the whole job was under my charge.
5490. What object would Dawson have in leaving these vacant places? I can only think that he did it for laziness sake.
5491. Dawson swears that you, being the contractors' manager, actually gave him instructions to do the work in the way in which he says he did it? That is not true.
5492. You swear that it is not true? I swear that it is not true.
5493. Do you remember giving him any particular instructions? No; I cannot say that I do. He came to me as an expert labourer in that particular class of work.
5494. As a bricklayer's labourer? Yes.
5495. And you employed him? Yes.
5496. How much a day did he get? He was getting 9s. a day at first, and 8s. a day latterly.
5497. When was he reduced to 8s. a day? He went to a job at Marrickville and he got 8s. a day there.
5498. Was he getting 9s. upon Contract 79? Yes.
5499. Right through? Right through until he came back from Marrickville, and then I paid him at the rate at which he had been paid at Marrickville.
5500. What did he say to the reduction of a shilling in his pay? He made no comment to me.
5501. He did not grumble about it? I never heard of it.
5502. Connors, the bricklayer, was employed there at the same time? Yes; on Contract 79.
5503. I suppose that whatever work the bricklayer's labourer did in the way of bad filling the bricklayer would be aware of it? Not necessarily. While the labourer would be packing the bricklayer would be below pointing up his work.
5504. He would be inside the tunnel? Yes.
5505. So that it is quite possible that the labourer might leave an open space without the bricklayer knowing of it? Yes; he might scamp his work, and then put a face on it and make the drive look as though it had been properly packed.
5506. Did you ever find Dawson a lazy man? No, or he would not have been there.
5507. He was off for some time, was he not? For about a fortnight.
5508. What was the cause of it? We were short of bricks at that time.
5509. Was that the only reason? The only reason.
5510. You are aware that Dawson, with another man, was once reported by Inspector Reid for putting in, or seeming to put in, dry metal into the packing of a shaft? No, I am not aware of that.
5511. Did you not hear something about it? Never.
5512. You heard of it lately? No. But I think I saw something of it in Reid's evidence. I saw something about dry metal going down one of the shafts, but I could not understand it.
5513. Have you not heard that Inspector Reid founded one of his complaints on the fact that he had discovered Dawson and another man putting down dry metal, or that he thought he had? I have never heard of it.
5514. You heard that Reid reported the men on some occasions for improper work? I think it was the manner of doing it that he found fault with, not the quality of the material.
5515. What do you mean by the manner of doing it? I mean the mode of carrying the work out, the mode of doing it. I fancy that was the cause of his complaint more than the quality of the work.
5516. What mode of doing it would that be? I mean the mode in which the work was done. It might be the mixing of the concrete or it might be something else.
5517. One of his complaints was that the concrete was mixed too soon, was it not? Possibly he may have made that complaint.
5518. Do you know anything about it? I believe at one time he did complain about the concrete being mixed before it was to be used.
5519. How came that to be done? I could not say. The men had to perform certain work and I suppose they did it as best they could.
5520. What instructions did you give as to the mixing of the concrete? Possibly I said that they were to mix it as best they could, but I forget now.
5521. You are aware, are you not, that concrete ought to be mixed not more than a certain time before it is used? Yes; it has to be wet only a certain time before it is used.
5522. It may be mixed dry sometime beforehand? Yes.
5523. But if the sand were wet, of course that would damp it? Yes; and in that case the cement might set.
5524. In that case it ought not to be mixed until immediately before it is required? That is so your Honor.

- J. Reid.  
26 June, 1896.
5525. He complained, did he not, that wet sand was used? I do not remember his complaint now. He made so many complaints.
5526. What sort of man was he with regard to the way in which he carried out his duties of inspection? I would rather not say anything about Reid.
5527. But I want you to do so;—what was your experience of him? I think he is a very objectionable man.
5528. Did you find him an honest man? I believe he was.
5529. Then in what sense was he objectionable? I mean the objectionable manner in which he made the men do the work.
5530. Do you mean his tone of voice, or what? I mean his tone of voice and his manner of doing it generally. He was always at variance with the labourers. I saw very little of the man myself; he was mostly down below. He and the labourers were always quarrelling.
5531. Dawson on several occasions gave the same evidence—that is, that the instructions upon which he acted were given by you, and that that is the reason why he scamped his work;—he swore that he did so for the sake of saving material, and that he acted upon your instructions? That is entirely false.
5532. Entirely false, you say? Yes.
5533. Did you hear at any time talk among the men as to Dawson's having said something about the way in which the work was done? I did hear it, but I did not believe it.
5534. When was that? Possibly six or seven months ago.
5535. Not before that? No.
5536. That would be early this year? Early this year, or the end of last year—I could not say which.
5537. What was it you heard? I heard that he had made a threat that if he was not paid for the time he was idle he would put the Company away.
5538. What time was that during which he was idle? The fortnight I have spoken of.
5539. Had he, then, been making any demand upon you? No.
- 5540-1. He made no demand upon the Company to be paid during that time? He never made any demand that I know of. I heard the statement made about him, but I did not put any reliance on it. I did not believe it.
- 5542-3. From whom did you hear this threat? I could not say now. I heard it from two or three people on the job—from a labourer amongst others, I think.
5544. Do you remember the names of any of the men from whom you heard it? I do not think I could now; the matter left so little impression on my mind that I really forget who told me.
5545. It would be quite an unreasonable demand that he should be paid for that fortnight? I should think so.
5546. But from the style of the man—from the way in which he spoke to you—do you think it likely that he would make such a demand? I do not.
5547. I wish you could remember the Christian name or surname of any man who said that he had heard Dawson making this threat? I could give you the name of one man—James Connors, the brick-layer.
5548. Where is he now? I do not know.
5549. Is he employed by the Company? He has not been employed by them for some time.
5550. When were you told—was it before or after he had left the work that you were told this? He was not working for the firm at the time that that took place.
5551. You mean at the time he said something to you about Dawson's threat? Yes.
5552. Have you no idea where Connors is to be found? I daresay you could find him in Marrickville somewhere.
5553. You yourself had a difference with Inspector Reid—one particular difference, had you not? I never had.
5554. Do you not remember his reporting you? He may have reported me, but I had no difference with him. I do not think I spoke to him more than twice on the contract.
5555. He said he reported you because you had come to him at No. 5 shaft and had told him to tell the inspector-in-charge that you did not intend to pack any of the shafts till they were finished;—do you remember some threat, or, indeed, saying anything which he may have construed into a threat of that kind? I do not remember now, but it is possible that I may have said it.
5556. If you said such a thing, how would it come about? Probably I meant it.
5557. But how could you pack the shaft after it had been finished? Easily. There is always a certain amount of space left between the brickwork and the ground.
5558. But supposing the shaft were from 80 to 100 feet in depth, it could not be done then, could it? It could be done, but, of course, it could not be done so well.
5559. Then did you say what you did by way of a joke? I could not have said it in earnest.
5560. Then you must have been chaffing Reid? That is possibly the case. I do not remember chaffing him. If he says I said it I will not say that I did not. As a matter of fact, the shafts were packed as they came up.
5561. That was the only practicable way of doing the work? It was the only way in which they could possibly do it honestly.
5562. If you said this thing either in a joke or in earnest there might have been some grumbling on the part of Reid? There may have been. There is not an inspector who does not grumble sometimes.
5563. And you say that Reid was a very difficult man to get on with? A very difficult man.
5564. You took Hansen off Contract 79A? Yes; I dismissed him.
5565. Because Inspector Andrew complained that he was not packing properly? Yes; and I dismissed him in consequence.
5566. Was he not taken straight on to Contract 69? I do not know.
5567. Had you anything to do with Contract 69? Nothing at all.
5568. All that you know is that you dismissed this man from Contract 79A? Yes.
5569. Did you send him away with a letter? Yes; I gave him a note for his money, and told him I dismissed him.
5570. To whom was the note given? To one of the contractors who was always on that contract.
5571. And you know nothing as to what afterwards happened to Hansen? No.

5572. Do you remember an occurrence in Mr. Chiene's presence when you opened a parcel containing a spirit-stand, a present for Mr. O'Hanlon? No.
5573. Do you remember something about a present from Mr. Carter to Mr. O'Hanlon when Mr. O'Hanlon was about to be married? I do not remember that. I remember when Mr. O'Hanlon was married, but I do not remember the present.
5574. Do you not remember a brown paper parcel being left at the office, and your being told by Chiene that this parcel was to be delivered to Mr. O'Hanlon? Do you remember opening the parcel, and looking inside to see what it contained, and afterwards making some remark about it? Certainly not.
5575. Are you sure of it? I have no recollection whatever of the occurrence. I certainly did not open any parcel.
5576. This is alleged to have taken place I understand at the office at St. John's Road at the Glebe? That would be many years ago.
5577. Do you remember Mr. O'Hanlon getting married? Yes.
5578. Do you not remember a wedding present being given to him by Mr. Carter, who is a liberal sort of man,—do you not remember something being given by Mr. Carter to Mr. O'Hanlon merely as a wedding present? I know nothing about it. It may have taken place, but it is six years ago since the thing happened.
5579. You have had a good many conversations at different times with Chiene? Yes.
5580. He swore positively that you had told him that many of the inspectors were being paid by the firm. What do you say to that? It is an untruth.
5581. Have you said anything similar to that to him? No, never.
5582. Nothing at all? No.
5583. You have heard of inspectors getting presents from members of the firm, have you not? No, never.
5584. No presents of any kind? No; I know nothing of them.
5585. Don't you remember taking down one of the pay-sheets and showing the name of an inspector, or the names of inspectors, as having received payments from the firm? No; I do not. That never occurred.
5586. Do you not remember showing more particularly the name of Inspector Corpe? No, not Inspector Corpe. There may have been Corpe's name.
5587. Who was Corpe then who was not an inspector? They are one and the same man, but he was dismissed the service through inability to attend to his duties.
5588. After he was dismissed what occurred? Several times Mr. Carter helped him financially.
5589. Did you, in point of fact, mention to Chiene that Corpe, after he had been dismissed, had been helped by Mr. Carter? Possibly; but I do not remember.
5590. Do you swear that during the time he was an inspector he was not to your knowledge helped by Mr. Carter? Not to my knowledge at any time.
5591. Do you know a man named Martin Byrnes? Yes.
5592. He was employed on what contracts? On many contracts I have been on.
5593. Do you remember a certain conversation taking place between Chiene, Martin Byrnes, and yourself, when something was said as to putting mullock in to help to pack before the concrete was put in? No; I do not.
5594. Are you aware of bad packing having been done where concrete ought to have been used. Are you aware of various kinds of rubbish being put in in place of concrete? No, I am not.
5595. Will you swear that that never occurred? It never did to my knowledge.
5596. You remember a man named Goddard who was employed by the firm? There are two men of the name of Goddard—one was employed at the Glebe and the other was employed at North Shore I think.
5597. You know the man Goddard who was employed at the Glebe? Yes.
5598. Do you remember mentioning to Chiene that Goddard had marked certain places in which shale had been put in, or in which something which ought not to have been put in had been put in in order to fill up places which should have been properly packed? I do not.
5599. You do not remember anything of the kind? Nothing of the kind ever occurred to my knowledge.
5600. One of the inspectors was named Gledhill, I believe? Yes.
5601. Was he an inspector at the Glebe contract? Yes.
5602. Can you identify in your mind No. 9 shaft at the head of Mitchell's Road? Yes.
5603. Do you remember Inspector Gledhill giving instructions that No. 9 shaft should not be filled until he was present? No.
5604. Are you sure that did not occur? It was not about that shaft at all.
5605. Did he give instructions as to some other shaft? No, not instructions.
5606. Then what did you mean just now by saying that it was not about that shaft? The shaft referred to is another shaft altogether I think—shaft No. 7.
5607. As to shaft No. 7 what occurred? It is the only shaft I can remember anything about. It was arranged between us that the centering should remain a certain time in the shaft before being drawn, and that as soon as that time arrived it should be drawn and the shaft filled in. Gledhill came up and said that the centering was out before the proper time, and we had a bit of a barney.
5608. Did he say that the centering ought not to have been drawn before he came? No. What he said was that it ought not to have been drawn until a certain time had elapsed.
5609. He said that the proper time had not elapsed? He did at the time, but he afterwards apologised.
5610. Was the filling done before the centering was drawn or afterwards? Afterwards.
5611. What state was the filling in when Gledhill came there? I do not suppose it had been filled at all when he came.
5612. Did not Gledhill complain on some occasion that the filling ought not to have been done until he turned up? Never.
5613. Was not a certain shaft filled in early in the morning before Gledhill came—whether it ought to have been done then or not? No work was carried out before 7.30 in the morning at any time.
5614. Do you swear that the only occasion when Gledhill made any complaint as to the shaft was when he said that the centering had not been allowed to stand long enough? Yes; he made a mistake as to the time.
5615. With regard to Martin Byrnes, perhaps you will remember what took place if I remind you of a certain

J. Reid.  
26 June, 1896.

certain expression which he used when he was told to get the mullock put in as soon as possible in a certain place;—do you remember his saying that if he were caught he would be hanged for it, and he added, “all right, I will be hanged for it; you clear out and keep the inspector away”? Not one word of it.

5616. Will you swear that nothing of that kind occurred? I swear it.

5617. Then I suppose Chiene must have been mistaken? I cannot help that.

5618. At any rate, you say there is no truth in the statement? I never allowed a man to do bad work in my life.

5619. As to truthfulness, what sort of man did you find Chiene? I have always found him truthful.

5620. Had he any quarrel with the contractors, or with the men at the works? Not to my knowledge.

5620½. As far as you know he had none? Not that I know of.

5621. You know that he was very kindly treated by the firm after he left? I do indeed.

5622. Do you remember a cask of cement being kept at the office at the Glebe for some purpose? No.

5623. Was there no cask of cement in the office at all? The office was too small for it?

5624. What would be the size of it? It was only a contractor's office—about 8 ft. x 10 ft.

5625. A cask of cement would take up only a small space under the desk? Yes, but there would be a table there, and also a drawing-table. If the cask was there, I never saw it. There was no cask of cement in the office, anyhow.

5626. Did you not show Chiene on one occasion a cask of cement in one of the offices? Certainly, I did not.

5627. Will you swear that you did not draw his attention to a cask of cement which was being kept there? No, I never in my life saw a cask of cement in the office.

5628. You are quite sure of that? I am certain of it.

5629. Then if Chiene swears that what might be called a sample cask of cement was kept there for the special purpose of taking samples out it would not be true? You mean for test purposes—that is entirely untrue.

5630. How was the testing carried out when the cement had to be tested? When the officials wanted a test taken they came and took the cement themselves out of the cask. There was generally a number of casks out in the shed.

5631. How are the heads of cement casks fixed on? With nails driven through a hooped ring on the top of the cask.

5632. If you once open a cask can you nail it up in such a way as to make it look as if it had never been opened? No, once you open it, it will show,

5633. Is the hoop put there for the purpose of keeping the head down? Yes. It is a wooden hoop.

5634. Nailed with wire nails on to the staves of the cask? Yes.

5635. Chiene has sworn that you showed him a cask of cement and told him that that cask was used for taking tests—that all the tests were taken out of it? That could not possibly be. The Government officials take their own tests from any cask they like to select out of those that are in the shed. There might possibly be a thousand casks there. What Chiene said, therefore, could not be true.

5636. *Mr. Smith.*] With regard to that little matter about the wedding present;—do you remember Chiene telling you that a parcel had come for O'Hanlon? I cannot remember it at all. It may have been so.

5637. Cannot you remember tearing open the parcel and looking at it? No, I do not remember that.

5638. When you saw what was inside it do you remember saying, “I do not begrudge him it because he has done the firm some service at North Shore”? Certainly not.

5639. You do not remember that at all? No.

5640. Did you ever boast to Chiene that bad work was done at all upon Contract 65? No.

5641. And that you dodged the inspectors? Never in my life.

5642. Did you ever say such a thing in chaff? Certainly not.

5643. Did you ever tell Chiene that Inspector Eyre wanted to see Mr. Carter, and did Chiene ask you what for, and did you say, “Carter is as good as 30s. a week to him”? No, certainly not.

5644. *Mr. Gummow.*] Before your employment with Carter & Co. what were you? I was labouring for some other firm.

5645. Were you always a labourer? No.

5646. You are an educated man? I am slightly educated.

5647. Do you consider that you are educated above the level of an ordinary labourer? Yes.

5648. Were you capable of making out pay-sheets before you started with Carter & Co.? I think so—yes.

5649. You were employed by Carter & Co. through whom? Through Mr. Snodgrass.

5650. Were you a personal friend of Mr. Snodgrass? Yes.

5651. Did you get your employment with the firm through personal friendship or through your ability as a manager? Through friendship in this case.

5652. As well as getting your pay with Carter & Co., did you learn your business as a manager? I think so.

5653. And in consequence you are more capable of doing your work than you were when you started with them seven years ago? Yes.

5654. Did you consider £2 10s. a week sufficient remuneration for you when you first started? I think so. I was quite satisfied.

5655. Did you ever ask for an increase in salary? Never in my life.

5656. Did you ever get any increases without asking for them? Yes.

5657. Did you ever get bonuses? Frequently.

5658. When you left the employ of the firm was it a sudden dismissal? I knew of it six months before I left.

5659. Who told you of your having to go? Mr. Carter himself, several times.

5660. Did Mr. Carter dismiss you finally? No, I left myself.

5661. Why did you leave yourself? The work had gone down to such a narrow point that I could not stay any longer.

5662. You were ashamed of drawing your pay and not doing any work? I was.

J. Reid.  
26 June, 1896.

5663. Did Mr. Carter give you anything at that time? He gave me a bonus of £10 when I left.
5664. And yet you say you had been employed by the firm for about six months with very little to do? That was not my fault.
5665. You had no reason to complain of the contractors' action in dismissing you—in letting you go at that time? Certainly not.
5666. When you were employed upon Contract 79 and 79A, had you plenty of material to hand? Any quantity.
5667. When material was wanted for a shaft, what action was taken to secure the supply of it? A carter was told off to see that material was supplied constantly.
5668. Did you take any sections at all on 79A? No.
5669. Could you tell by gauging the length of the tunnel between the shafts how much sandstone concrete would be required? No; I took no sections.
5670. You could not tell by the length of the work how much sandstone concrete it would take? No, I could not tell.
5671. Did you ever shout for the men upon Contract 79A? Frequently.
5672. With what object? I do not know that I had any object in view.
5673. Did you want a drink now and then? Sometimes.
5674. Did you generally go in by yourself to have a drink? I did not.
5675. Did the men ever shout for you? Yes.
5676. Did Dawson ever shout for you? Yes.
5677. Do you remember the last time you were drinking together? Yes; the day he left the contract.
5678. Do you remember what occurred? They drank my health with musical honors.
5679. He did not refer to any bad work at that time, did he? No.
5680. Did he appear to be quite satisfied when he left? He left perfectly satisfied as far as I knew at the time.
5681. In the carrying out of Contract 79A, did the contractors interfere with you in any way in the carrying out of your duties? No.
5682. You had an absolutely free hand? Yes.
5683. You said that you paid Dawson 9s. at one time, and that he was afterwards paid 8s.? Yes.
5684. What was the reason for the reduction? When he went to Marrickville he went under some of the contractors, and seeing that they only paid him 8s. I did not see why, when he returned to us, I should raise his wages again. The other people gave him 8s., and I simply followed them.
5685. You have said that you heard Dawson had said that bad work was done—that he had left some bad work, and that he had made some threat about giving the Company away? Yes; he said he would put the Company away. Those are the words I heard.
5686. Did he ever come to you for blackmail? Never.
5687. He was off the job for nearly a fortnight you say? Yes.
5688. Did he ask for full pay for that fortnight? No.
5689. When you heard of this bad work was the contract still in the Company's hands? Yes.
5690. Could the Company have got this work put right if they had thought it was there? Very easily.
5691. With regard to Inspector Reid, in what way did he carry out his duties in looking after the work—did he speak openly on any subject concerning which he had a grievance—did he speak openly to you and to the men? He never spoke openly. His manner of making a complaint was very offensive.
5692. Do you know if he used to stand openly by the board when concrete was being mixed? I know he did not. I have frequently seen him go behind a tree in the park at night-time and watch the men from a distance.
5693. Did he act as an inspector or as a detective? He acted as a detective, not as an inspector.
5694. As to this spirit-stand, you say you do not remember anything about it? Not a word.
5695. You are quite sure you cannot? Certainly.
5696. As to Goddard, what was he on the job? A miner.
5697. Had he anything to do with the concrete, or with the putting in of the concrete? Nothing at all.
5698. Do you remember when he got paid off? Yes.
5699. Do you remember telling Chiene that Mr. Carter wanted to square Goddard? No, I never did.
5700. What do you remember in connection with his being paid off? We had a dispute as to his final pay; I refused to sanction it.
5701. Do you know what action was taken by Mr. Carter? I know he paid the money after a while.
5702. The money you refused to sanction the payment of? Yes.
5703. Do you know whether Goddard had taken out a summons against Mr. Carter? I do not recollect.
5704. If he had taken out a summons, what would it be for? For the amount of his wages, I presume.
5705. Do you think Mr. Carter was likely to pay the man the wages he claimed on the strength of the summons? I think the matter in dispute was very slight.
5706. Knowing Mr. Carter as you do, can you say whether he would prefer to pay or be bothered about going to Court? He would pay it.
5707. Do you remember Chiene meeting with an accident? Very well.
5708. You remember his coming back to work after the accident? I do.
5709. Do you consider Chiene was in as good a state of mind and body after the accident as he was before it? Not by a long way.
5710. What state was he in afterwards? He got very childish.
5711. Did he recover? He did after a while—slightly.
5712. Have you seen him lately? I have.
5713. Do you consider that he is all right now? I do not.
5714. Were you afraid to let him go down the shafts? At the Glebe—yes.
5715. What were you afraid of? I was afraid that he might fall.
5716. He was very shaky? Very shaky.
5717. As to this cask of cement;—do you know how cement is put into casks, or have you heard how it is put in? I know it is pressed in tightly, but I do not remember in what way.
5718. Could you by any means press it into the cask as tightly as it is put in in the first place, if the cask were disturbed? Not by any means.

- J. Reid.  
6 June, 1896.
5719. If a cask had been opened and partially used, could you fill it up again to the same state as before? I could not.
5720. Could you tell me whether an inspector takes cement for testing purposes from the top of the cask, from the centre, or from the bottom? From the three places as a rule—first from the top, then about the middle of the cask, and then from the bottom.
5721. So that he would get a fair sample? Yes.
5722. Would he be likely to take a sample out of one cask only when there were about 500 casks in the shed? No, he would take a number of samples in proportion to the number of casks in the shed.
5723. Am I to understand then that he would take samples out of a number of casks? Yes.
5724. Had you anything to do with that business? No.
5725. Had the contractors anything to do with it? Not to my knowledge.
5726. Have you ever seen them interfere in such matters? No.
5727. Did you interfere at all? Never in my life. The Department sent their own men, who took their own tests.
5728. *Mr. Parkes.*] Dawson was employed for how many years do you say? Possibly, four.
5729. For only four? I could not say for how many more, but for four years to my knowledge.
5730. During the time he was employed had he not many breaks in his labour? Very likely he would have.
5731. Did he ever make a complaint about these breaks and demand some money in consideration of them? No.
5732. Did he not demand money on those occasions? Not to me.
5733. What contract was Mr. O'Hanlon on? I could not say.
5734. Do you know him? Yes, well.
5735. Did you ever work under him? No; with the exception of a day or so at North Shore. He relieved the resident engineer and laid off a couple of shafts.
5736. On what contract was that? No. 79.
5737. How long was he there do you say? Two days, I think.
5738. How long were you working on that job? Four years.
5739. Was two days the whole of the time he was there? Yes, in my knowledge.
5740. When you three men were at the shaft—Byrnes, yourself, and Chiene—do you recollect a conversation taking place? I do not recollect the conversation you refer to, and I do not believe it took place either.
5741. You were at the shaft together? We were on the contract together. I do not know what shaft you refer to.
5742. Do you remember standing at shaft No. 7 with those men? It is very likely we were there, but I do not remember it.
5743. You are sure you had no conversation there with these men—you are sure you were never there? That I could not say.
5744. Tax your memory please? I could not remember where I was on a particular day six years ago.
5745. Your memory is not good as to what occurred six years ago? No.
5746. You could not rely on your memory to that extent? Not in regard to little things like that.
5747. On what date did Inspector Corpe leave your job at the Glebe? I could not say.
5748. Can you not remember the date he left? No.
5749. Was the job nearly completed? I could not say. One inspector would not be there from start to finish. The inspectors are shifted about as the Department thinks fit.
5750. When did Corpe die? I could not say. Possibly three or four years ago.
5751. At what time was the contract at the Glebe completed? About five or six years ago.
5752. He died after that? I think so.
5753. With regard to the building of shafts, sometimes the brickwork touches the sides as it comes up owing to the irregularity of the excavations? Yes; sometimes.
5754. There is no regular face? No.
5755. In some cases if the concrete is tipped in at the side there will be a considerable saving? Yes.
5756. You know Goddard well? I do not know him well.
5757. You have often had conversations with him? I do not believe I have had more with him than with other men on the works.
5758. Will you swear that Goddard did not do bad work near to shafts Nos. 12 and 13? He was a miner. He could not do bad work.
5759. Did he never mix any concrete? Not to my knowledge—never under me.
5760. Will you swear that he did not mark the bad work? I remember marking some of his work as bad? I would not pass it.
5761. What was the nature of it? The drive, when finished, was found to be too tight in places.
5762. Will you swear that he did not mark the face of the sewer to show where there was bad work? Not that I know of.
5763. Will you swear that he did not tell you so? I will swear that. He was a miner, not a concreter.
5764. But he could mark the places where he knew the bad work existed, I suppose? Certainly he could, if he liked.
5765. Will you tell me the name of the man who told you that Dawson had said that he was going to put the contractors away? Yes; Connors.
5766. Will you tell me the name of any other man who told you that Dawson had said this thing? I cannot remember any other names just now.
5767. You said that Dawson could do bad work without Connors the bricklayer knowing it, did you not? Certainly he could.
5768. How long would it take a bricklayer to build a succession of drums 14 feet in length? I could not say. I never timed them.
5769. Would it take half a day? No.
5770. How long would it take them? A good man could do eight drums a day.
5771. It would take some hours? Yes.
5772. What would Connors be doing during the time Dawson would be leaving the space open? He would be pointing his work up and cleaning it down. 5773.

5773. Will you describe how the packing is done? It is put in with a shovel over the brickwork and then rammed with a rammer until tight. J. Reid.
5774. Does not one man supply the material while the other does the work? No; a man supplies that from the top. 26 June, 1896.
5775. But is not one man down below fetching the material to the other? No.
5776. If a bricklayer is going along with the work, the man who is doing the packing would be in close association with him, would he not? Yes; but you can't be laying bricks while another man is packing.
5777. But the bricklayer must observe the man who is packing, must he not;—he must do so from the narrow space in the tunnel? Yes.
5778. He could not possibly make a mistake, could he, without being observed—the man who was packing? No; if any spaces were left open, of course the other man could see them.
5779. Then Connors could not make a mistake in saying that Dawson had done bad work? There can be no doubt about it at all. There are cases, of course, where a bricklayer would build more than two drums at a time in the case of big work.
5780. *His Honor.*] How many drums back could a man pack? Three drums, comfortably.
5781. What length is a drum? Two feet 6 inches.
5782. *Mr. Parkes.*] What would be the length of the rammer? It would be as long as required.
5783. Could he properly pack back three drums? Yes, comfortably in big ground. Of course, I do not mean in small ground.
5784. Were the pay-sheets of Carter & Co. signed when the payments were made? No, never.
5785. You made up these pay-sheets? Yes.
5786. What was the date of the pay-sheet upon which Corpe's £1 appeared? I could not tell you, within a year.
5787. How long was it that he left before the contract at the Glebe ceased? I could not say.
5788. Would it be a month before? I could not say.
5789. Would it be two months before? I could not say for certain if his name ever appeared on the pay-sheets.
5790. You said, I thought, that his name did appear? We gave him money I know.
5791. While he was an inspector? No; while he was ill.
5792. Was he an inspector then? No; he was discharged through illness at the time I refer to.
5793. You know Inspector Fowle? Yes.
5794. Did he make an inquiry concerning your dispute with Inspector Reid? I do not know that he did.
5795. Did he report in regard to it? I do not know that he did.
5796. What was it that you said to Reid exactly? I could not say.
5797. I mean about the filling of the shaft? I cannot tell you what I said to him, because I do not remember any conversation at all with him. I do not think I spoke to Reid twice upon the contract.
5798. Is it not the custom of tradesmen who supply various materials to contractors to send a cask of cement to the contractor—either to the contractors or their manager? I do not quite understand you.
5799. Is it not the practice of merchants to send a cask of cement to contractors as a sample? It is not. I never saw it done, anyhow.
5800. Will you give me the names of some of the men who worked on the Glebe job, who did the concrete periphery or any portion of it? Well, there were Martin Byrnes and Labrees.
5801. Can you tell me of any more? I cannot think of their names just now.
5802. Do you recollect whether Inspector Norby was on that job? I cannot remember. I do not remember the name.
5803. Was there not such an inspector there? I do not remember that there was. He was not there for long at any rate.
5804. Did you not on one occasion say to Inspector Fowle that you had mixed concrete just as it suited yourself? Very likely.
5805. How did that occur? I cannot say now. It is very likely that I did say it.
5806. Was it not Inspector Fowle who found fault with your work? I cannot say that he ever found fault with my work.
5807. How did this conversation come up? I could not tell you these things now for my life.
5808. How long ago is it since you were on Contract 79? Three and a half years ago.
5809. You cannot recollect three and a half years ago? Not a conversation which took place then.
5810. Then, how is it that you are able to give such definite replies in regard to other matters which happened then? They impressed themselves on my memory, I suppose.
5811. What I am referring to happened about two years ago; you seem to have a very clear memory for things which it is convenient to remember, but a very cloudy memory for things which it is inconvenient to remember; surely you remember a quarrel which took place two years ago? It was not a quarrel, I think.
5812. You had some words with Inspector Fowle, finding fault with your work;—do you not remember Inspector Fowle reporting as to the difficulty he had in getting Carter & Co.'s men to do their work properly? I do not.
5813. *Mr. Gummow.*] With regard to Mr. O'Hanlon, you say that you saw him two days on Contract 79? Yes.
5814. Did you ever see him in any of Carter & Co.'s offices? I saw him once in Carter & Co.'s office at the Glebe.
5815. What was he doing there? He was there with an engineer from a neighbouring contract.
5816. What was he doing? I think he was giving them some lines.
5817. You had conversations daily with workmen, I suppose? Yes.
5818. Can you remember all these conversations? I cannot.
5819. Did you have "barneys" with them, as you term it? Frequently.
5820. Did you have frequent "barneys" with the inspectors? Yes.
5821. Can you tell me how many inspectors there were altogether upon Contract 79? At one time there were seven there, I think.
5822. Can you remember whether it was not the case that at one time you had there nearly as many inspectors as you had men? We had seven there, I think, at one time.

- J. Reid.  
26 Jan., 1896.
5823. What were their duties do you remember? I suppose they were there to watch the work which was being carried on on the contract.
5824. What work were the contractors doing at that time? Bricklaying, packing, and rendering—the usual work.
5825. Were any inspectors looking after the blasting? The blasting was all finished at that time.
5826. Where were you when the blasting was going on? On the contract.
5827. Was there no inspector there while the blasting was going on? Yes.
5828. Do you remember whether you were blasting or cutting out? Blasting.
5829. Do you remember what the inspector's duties were when you were blasting? Yes; to see that we kept in a proper centre, and that we did not use an excessive amount of powder.
5830. Did not the inspectors look after their duties very carefully in the matter of blasting? Yes; I think they did all through on that job.
5831. As to these shafts at North Shore and a conversation which you are supposed to have had with one of the inspectors as to the filling up of the shafts when they were finished. Will you describe to His Honor how the shafts are built. I think there must be some misunderstanding on this point. Are not the shafts built up close to the rock? In some cases.
5832. In other cases are they not built up with a good space left between the rock and the brickwork? Yes; 2 feet round sometimes.
5833. With what do you fill in that 2 feet? Rock filling.
5834. Not concrete? No.
5835. Is it likely, in reference to this conversation you are supposed to have had, that it was in regard to a shaft of this description when there would be 2 feet round the chimney stack, as we term it? I could not say, I am sure.
5836. But you are sure there are two ways of building shafts? Yes.
5837. One close against the rock? Yes; we put concrete in in that case.
5838. And in the other case when you build a chimney-stack you fill in the space round it with rock? Yes.
5839. You said that the bricklayer could see whether Dawson was doing his work properly? Yes; if there were a space of 14 feet he ought to have seen it.
5840. The bricklayer, you say, would be pointing during the progress of the packing by the labourer? Yes.
5841. The labourer, therefore, would be working above him? Naturally.
5842. If the labourer put up a face of concrete, and the bricklayer had no suspicion of bad work being done, could he tell whether the space behind the face was packed? Certainly not.
5843. You are sure of that? Yes.
5844. *Mr. Smith.*] You have seen the men, I suppose, doing tunnel-work with a gad, as it is called? Yes.
5845. What is the effect upon them, as regards their health? I could not say how it affects them, but men who follow the occupation closely do not live many years.
5846. What is their illness attributed to? The men themselves attribute it to the dust getting into their lungs.
5847. Does the same thing happen when they do their work by blasting? Not nearly to so great an extent as when guttering and gadding is done.
5848. Do not the fumes of the powder affect them? No; I never heard of any sickness being contracted through the fumes of the powder.
5849. *Mr. Gummow.*] As to the question of pay-sheets, you say that you have made out most of them? Yes, for years.
5850. Upon what contracts have you made out pay-sheets? There is only one I have never touched and that is the Balmain contract at present in operation.
5851. Are there not two contracts at Balmain? Yes; but there is only one office.
5852. Do you do most of the clerical work of the firm? Yes.
5853. Have you ever kept any books for the firm? No.
5854. Do you know of any having been kept? No, I do not.
5855. Have you ever seen any? I never saw a book in the offices.
5856. Referring to Chiene, do you remember his asking Mr. Carter for £100? Yes.
5857. For what purpose did he want it? A tote I think; I believe he wanted to run a tote.
5858. Did Mr. Carter give him the money? He gave him £20.
5859. To run a tote? I do not know. I left the office when the question arose.
5860. *Mr. Parkes.*] How long ago is that? Three or four years ago.
5861. You seem to have a wonderful memory for that? It was the idea of running the tote which impressed the thing on my memory.
5862. *Mr. Gummow.*] Mr. Parkes says you have an extraordinary memory for some things;—can you tell us how long ago it is since you saw me? I saw you this morning, and I saw you yesterday.
5863. Did you see me accidentally yesterday? Yes.
5864. Did I speak to you? Yes.
5865. Did I ask you any questions about this Commission? We spoke generally about the Commission.
5866. Did I say anything to you about Chiene's evidence? Not a word.
5867. Did you have lunch with me? Yes.
5868. We spoke generally about contracts? Yes.
5869. Did I ask you for any information as to the Glebe contract? No, not at all.
5870. *Mr. Parkes.*] You are sure that Mr. Gummow did not yesterday refer to any matters concerning which you have been asked questions to-day? We talked of matters generally, but of nothing specifically.
5871. Did not Mr. Gummow refer to any matter connected with conversations between Chiene and yourself? No; he did not.
5872. How long prior to yesterday was it since you saw Mr. Carter or Mr. Gummow? I saw Mr. Carter, I think, one day last week.
5873. Did you speak about this matter? No, we did not. I do not know when I last saw Mr. Gummow, I see him frequently.
5874. Where did you meet him yesterday? Somewhere in the Pymont Bridge Road.
5875. Where do you live? At Waverley.
5876. Where does Mr. Gummow live? At Ashfield, I think.

5877. In what part of the Pymont Bridge Road did you meet him? I could not say in what part.  
 5878. Near what street? Near the Glebe-road.  
 5879. But surely you cannot forget the street near which you met him? It was somewhere near the tram line or near the Glebe-road. That is all I recollect.  
 5880. At what time did you meet him? At about 11 o'clock.  
 5881. What were you doing out there? I was going out to the contract.  
 5882. To Carter, Gummow, & Co.'s contract? Yes.  
 5883. Do you expect to get on to one of their contracts again soon? No; but I have been there frequently.  
 5884. Why did you go to the contract,—were you sent for? No; I was not. I went there to test an explosive.  
 5885. Are you managing an explosive? Yes; but not any explosive in which they are concerned.  
 5886. You were not attending to the explosive on this job? I frequently went there to test an explosive. I went there yesterday for that purpose.  
 5887. To test your own? Yes.  
 5888. Therefore, you still have some connection of a sympathetic nature with the firm? No; they happen to be the only contractors that I know, and I wanted to test the explosive.  
 5889. If the firm got further work would you be taken on? I do not know; I should like to be.

J. Reid.  
 26 June, 1896.

George Forrest sworn and examined:—

5890. *Mr. Parkes.*] What is your occupation? I am a contractor.  
 5891. You are a member of the firm of Carter, Gummow, & Co.? No, I am a shareholder with them at the present time.  
 5892. An equal shareholder? Yes.  
 5893. In June, 1895, you entered into a bond with the Government of New South Wales as a surety for Messrs. Carter, Gummow, & Co. in relation to the carrying out of Contract No. 77, did you not? Yes. (*Vide Appendix No. 24.*)  
 5894. And you then made a declaration that you had property in New South Wales to the value of £6,000;—will you say where that property is? Yes. It is not altogether in New South Wales;—some is in New Zealand and some is in this Colony.  
 5895. What property are you possessed of in New South Wales? A third share of a property known as "The Lodge" property at North Shore and other property.  
 5896. Is it freehold;—have you a Torrens title? Yes.  
 5897. What is the area of the allotment? Two acres.  
 5898. What is the frontage? I could not say definitely, but it is about 500 feet.  
 5899. Is that where Mr. Carter lives now? No.  
 5900. What is the value of the property? I could not say exactly, but it would be worth about £10,000, I suppose.  
 5901. What did you pay for it? £6,000 or more, I think. We have built upon it to the value of several thousands, I think.  
 5902. When did you buy this property? Four or five years ago.  
 5903. Where do you bank? I bank with the Bank of New Zealand.  
 5904. Have you a separate account? Yes.  
 5905. A private account? Yes.  
 5906. Do you know James Gillan? Yes.  
 5907. Where is he now? At Happy Valley, near Adelaide.  
 5908. What property has he in New South Wales? I only know of his having one property, and that is in Fairfowl-street, Dulwich Hill.  
 5909. What is the size of the property at Dulwich Hill? I do not know exactly. It has a frontage of 140 feet, I think.  
 5910. What would be the value of it? I could not say. About £1,200, I suppose.  
 5911. Where does Mr. Gillan bank? I have no idea.  
 5912. Does he bank with the Bank of New Zealand also? I have no idea.  
 5913. Do you know the name by which Mr. Gillan's property goes? "Blink Bonnie."  
 5914. Mr. Gillan is in Adelaide at the present time you say? Yes.  
 5915. *His Honor.*] What do you say is the whole value of your property, including your property in New Zealand—what is your estimate of the value? Over £6,000.  
 5916. *Mr. Parkes.*] Will you please tell the Commission what your other properties are? They are in New Zealand.  
 5917. What do they consist of? Five dwelling-houses, and, I think, about five vacant sections.  
 5918. Where situated? Some of it is in the M'Andrew Road, Dunedin.  
 5919. What are the numbers of the houses? There are no numbers on them.  
 5920. Where are the vacant sections of land? In George-street, Dunedin.  
 5921. What are the numbers? There are no numbers. I ought to explain that there are three houses in M'Andrew Road and two houses in George-street. The land is at the corner of George-street and the main street in which the tramline runs.

G. Forrest.  
 26 June, 1896.

John Carter recalled and further examined:—

5922. *Mr. Parkes.*] Do you know Mr. Gillan's affairs? I do not.  
 5923. Do you know whether he has any further property in this Colony apart from that at Dulwich Hill? I do not.  
 5924. Mr. Gillan is now in Adelaide, I believe? Yes; 18 miles out of Adelaide.  
 5925. Would there be any great objection to his coming to New South Wales? There is from our point of view—from a business point of view. He is in charge of a work which is just approaching completion. We are pushing on with it night and day to satisfy the Adelaide Government, who want the work available for a supply of water next summer.

J. Carter.  
 26 June, 1896.

- J. Carter. 5924. That is the only objection to his coming over? Yes; it is purely a business objection.  
 5925. *His Honor.*] Is there anyone else who could take his place satisfactorily? No. Mr. Gummow and myself are here.  
 26 June, 1896. 5926. I suppose that unless Mr. Gummow were to go down he could not very well leave? No.  
 5927. Is Mr. Gillan an engineer? No.  
 5928. What is he by profession? He is a self-made man. He started low down in life and worked himself up. He saved his money and got into his present business.  
 5929. Is he specially competent to look after a work of this kind? He is specially competent to look after it now. He was not while the work was in course of being driven. He could not then have done without other assistance; but he is thoroughly conversant with the practical part of the work.  
 5930. Then I understand that it would be necessary for Mr. Gummow to go down if Mr. Gillan came up? I should say so. Some member of the firm must be here to represent our interests.  
 5931. How soon will the work be over in which Mr. Gillan is now engaged? I believe Mr. Gummow has received a letter in which Mr. Gillan states that it will be completed in about six weeks.

Harold Francis Norrie sworn and examined:—

- H. F. Norrie. 5932. *Mr. Parkes.*] You are an officer in the Department of Public Works? Yes. I am clerk in charge of bonds and contracts.  
 26 June, 1896. 5933. You drew up in June, 1895, a bond which was signed by Mr. Forrest and Mr. Gillan? No; I think it was drawn up on 16th May, 1895, and signed on the same date. (*Vide Appendix No. 24.*)  
 5934. Did you, before accepting their security, make any inquiry as to who Mr. Forrest and Mr. Gillan were? No.  
 5935. But it would be your duty to do so, would it not? No.  
 5936. Why not? That is a responsibility which the head of the branch has always undertaken.  
 5937. Would it be Mr. Hickson's responsibility? Either Mr. Hickson's or Mr. Darley's.  
 5938. Who was at the head of the branch at the time this bond was drawn up? Mr. Darley.  
 5939. Was it not drawn up prior to Mr. Darley taking charge? No; Mr. Darley took charge, I think, on the 1st or 2nd of April, 1895.  
 5940. Is not this your suggestion?  
 "I suggested to Mr. Hickson yesterday the desirability of blotting out his signature and printed title on the conditions, substituting those of Mr. Darley, which was at once assented to. A reference will, too, be made in the agreement and bond to the plans being in Mr. Darley's office.—HAROLD F. NORRIE, 4/4/95."  
 Yes. That was in the early part of April.  
 5941. Therefore, who would be at the head of the branch at that time—who would have to look into this matter? At that time, Mr. Darley, I think, but I believe you will see from the papers that both Mr. Mr. Hickson and Mr. Darley approved of the sureties.  
 5942. How is it that Mr. Hickson as Engineer-in-Chief recommended the acceptance of these gentlemen. He says:—  
 I think, therefore, it is right that the sureties should be insisted upon. They give the names of two men, Mr. George Forrest and Mr. James Gillen. From inquiries made I believe these men to be financially sound; and, I think, if their names were accepted as the sureties in the penal sum of £6,000, each Department would be secured as far as it is reasonably possible to be.  
 ? I think that was written in March.  
 5943. You will see that it is written on 5th April, when according to your statement, Mr. Darley was in charge? That was about the time of Mr. Darley's taking charge.  
 5944. He was in charge, was he? Practically.  
 5945. Then why should Mr. Hickson write this recommendation? I could not say.  
 5946. *His Honor.*] Mr. Darley was nominally in charge but Mr. Hickson remained practically in charge I suppose? For a few days, I think.  
 5947. *Mr. Parkes.*] Mr. Hickson also says:—  
 They go on to say that they are "a firm of sound financial standing, well and favourably known to the Department as contractors" This is quite true; they are a firm in which I have every confidence. They have done a great deal of work under me, and I can testify that their aim always has been to turn out the very best class of work possible. At the same time, misfortunes happen the very soundest firms of contractors, and the Department must look a little way into the future. Their own bond for £12,000 would be really of no use if they were unfortunate enough in the meantime to become bankrupt.  
 Does not that fairly set forth the nature of your bond? I do not quite follow you.  
 5948. Is it not a fair interpretation of the objects of your bond? As a matter of course we wanted to secure ourselves in the event of anything happening.  
 5949. If you had known that Mr. Forrest and Mr. Gillan were interested in contract 77 would you have accepted their names as sureties? I certainly would not. I did not look upon them then as two members of the firm.  
 5950. Did you know them to be contractors? I knew them to have been contractors.  
 5951. Did you know them to have been connected with this firm in any way? Yes, previously.  
 5952. You will see that on 5th April Mr. Hickson wrote the letter from which I have quoted, and on the same day it was transmitted to Mr. Darley for report. Three days afterwards Mr. Darley wrote—  
 I concur with Mr. Hickson. I think in accepting a new patent of this kind, and adopting it on a large and costly contract, that the Department cannot be too careful in securing its position by leaving all the risk on the hands of the contractors and patentees. I therefore recommend that the personal names be required for further surety. The names mentioned may, I think, be accepted.  
 Therefore it seems that Mr. Darley approved of the sureties in conjunction with Mr. Hickson. He evidently had not taken up the duties of Mr. Hickson? Nominally he had. I think the new appointment had been gazetted on about 2nd April.  
 5953. Would it not have been your duty as solicitor, practically, to the Public Works Department, to satisfy yourself as to these sureties? The Crown Solicitor is really the solicitor to all the departments.  
 5954. You are consulted upon legal points by the Department of Public Works are you not? Yes.  
 5955. And practically you fill the position of solicitor to the Department? Yes.  
 5956. Would it not be your duty to look into these sureties to see if they were substantial and good? Yes, and I did so to the extent of taking a declaration from each of the sureties that they were worth the amount of the bond.  
 5957.

5957. Did you make any inquiries into the value of the property held in this Colony by the sureties? No. H. F. Norrie.  
 5958. But you knew that they were connected with the contracting firm of Carter, Gillan, & Co.? I knew that they had been, not that they were then. 26 June, 1896.

5959. You did not inquire further to see whether they were still connected with the firm? No. I might explain that Carter & Co. and Carter, Gummow, & Co. had signed many contracts with me. Sometimes as Carter and Snodgrass, at other times as Carter, Snodgrass, and Forrest; again as Carter, Snodgrass, Gillan, and Forrest; again as Carter, Gummow, and Snodgrass; again as Carter, Gummow, Snodgrass, Maddison, Gillan, and Ewing. I do not think that at any times there were two contracts with the same parties to them. I remember upon one occasion asking Mr. Carter why it was so, and he said, "We are on our own in this." I think three or four members had signed the previous contract, and there were only two in that one. (*Vide Appendix No. 25.*)

5960. *Mr. Smith.*] In this particular case the tender was signed by three only—Mr. Carter, Mr. Gummow, and Mr. Snodgrass? The tender at the foot is signed by Carter, Gummow, & Co., and there is a marginal note asking for the names of the parties, in the event of a firm tendering, and therefore the names of Carter, Gummow, and Snodgrass are added.

5961. Those are the only men you knew in the matter at that time? Yes.

5962. In making these bonds, do you do more than take a declaration as to the sureties? No.

5963. That is the ordinary practice. You get a declaration from them stating in general terms the value of their property? Yes.

5964. And the usual course was followed in this instance? Yes.

5965. Had you not anything to do with the inquiries which were made before the papers were sent down to you with the minutes? As a matter of practice I never have.

5966. You would have seen from Mr. Hickson's minute that inquiries had been made? Yes.

5967. But you did not know anything about them? No; I was satisfied that Mr. Hickson and Mr. Darley had made inquiries. I could see that they were satisfied on the point.

5968. *Mr. Gummow.*] You have said that the names of different partners appeared in connection with different contracts? Yes.

5969. In one of your statements you said that Messrs. Carter, Gummow, Maddison, Ewing, and Gillan, appeared? To the best of my recollection there were about five in the case of one contract.

5970. Do you know what contract that refers to? No I do not recollect the particular number.

5971. Would it be No. 69? There was only one contract I think in which there were five names. I do not think five partners signed more than one contract, and it was probably 69.

5972. Do you know whether Mr. Gillan's name was ever in a contract with Messrs. Carter, Gummow, & Co. as one of the contractors? I do not know that I do.

5973. Can you show his Honor one case in which Mr. Gillan's name has been put down as a member of the firm of Carter, Gummow, & Co.? I could not say without looking into the contracts the firm has entered into.

5974. You do not know it as a matter of fact? I do not.

5975. Could you give the contracts which Carter, Gummow, & Co. have had as Carter, Gummow, & Co., giving the names in each instance? Yes.

5976. Will you make out a list of all the contracts giving the signing parties? Yes.

5977-8. As to Mr. Forrest—do you know whether his name has ever been put down as a partner in Carter, Gummow, & Co. in a contract with the Government? I cannot say.

5979. You can give us information as to that on a later date? Yes.

5980. Do you remember whether Mr. Forrest is one of the contractors in Contract 79? No; my recollection of 79 is that Mr. Forrest was made a party to release any interest he may have had in connection with Contract 72.

5981. Will you look at the heading of the agreement on page 272. It reads:—

Agreement made this 10th day of March, in the year of our Lord 1892, between John Carter and David Graham Snodgrass, of Glebe and North Shore respectively, in the Colony of New South Wales, contractors, carrying on business together at the Glebe aforesaid, as contractors, under the name, style, or firm, of "Carter and Co.," and hereinafter styled or referred to as "the contractors," of the first part, George Forrest, of Glebe aforesaid, contractor, of the second part, and Her Most Gracious Majesty Queen Victoria of the third part.

Does that show that Mr. Forrest was a member of the firm of Carter & Co.? Not as to that particular contract.

5982. As to any contract later than that date can you show whether his name appears as one of the contractors? I should have to look into all the contracts which were signed subsequent to that date before I could say definitely.

5983. As to Contract 77, there were two bonds taken, as well as some other securities? In the first place there was a covenant from the contractors, and a cash deposit of between £700 and £800; I think there was a bond also taken from three members of the firm, and separate bonds from Mr. Gillan and Mr. Forrest.

5984. Can you tell me in connection with any sewer contract which has been let whether any bond similar to that which Mr. Forrest and Mr. Gillan made was taken? No; because we have always taken a cash deposit.

5985. Have you taken sureties in any other case? I think so; I think we took sureties in the case of No. 69.

5986. Did you take a cash deposit as well? No.

5987. Do you know why sureties were taken in that case? Yes.

5988. For what reason? The contractors were being paid with funded stock at par, and they, I think, made an application to the Minister that they might be allowed to substitute securities in lieu of a cash deposit.

5989. Did other contractors get that concession? Yes. Several others who were being paid in the same way I think.

5990. Can you tell me about Contract 112;—what took place in that case? I do not recollect. I cannot say now whether we took a cash deposit or a bond.

5991. Did you take both? I am sure that we did not take both. We took one or the other; but I will get you that information.

MONDAY, 29 JUNE, 1896.

Harold Francis Norrie recalled and further examined :—

- H. F. Norrie. 5992. *His Honor.*] You were requested at the last sitting of the Commission to produce a list of contracts entered into between members of the firm of Carter, Gummow, & Co., and the Public Works Department? Yes; I now hand it in. It shows the contracts entered into by Messrs. Snodgrass and Gillan; Rochester and Gummow; Gummow, Bennett, and Canty; Gummow & Co.; Forrest and Snodgrass; Gummow and Gillan; Carter & Co., and Carter, Gummow, & Co. (*Vide Appendix No. 25.*)
5993. That is a correct list? Yes. I was asked a question the other day with reference to Contract 112. I find that we took a deposit of £870, and that there was the usual agreement under seal.
5994. *Mr. Gummow.*] Could you give us the particulars on the bonds in the case of Contract 101? I think that in the case of 101 there was a bond without cash deposit. I think that is one of those cases in which the contractors were paid from Funded Stock; but I speak with some diffidence upon that point.
5995. *Mr. Parkes.*] Did not the names of Mr. Forrest or Mr. Gillan appear in connection with the contracts of these two firms once separated but now associated? Yes; they did. Contract 22 is between Snodgrass and Gillan and the Government. In the case of Contract 78 the names are Gummow, Gillan, Maddison, and Ewing; in the case of 38, Forrest and Snodgrass; in 32, Gummow, Gillan, Maddison, Bennett; in 45, Forrest and Snodgrass; in 60, Carter and Forrest; in 61, Carter and Forrest; in 63, Gummow, Gillan, Maddison, and Ewing; in 66, Gummow, Gillan, Maddison, and Ewing; in 65, Carter, Snodgrass, and Forrest; in 72, Carter, Snodgrass, and Forrest; in 74, Gummow, Gillan, and Ewing; in 78, Gummow, Gillan, Maddison, Ewing; in 108, Carter, Gummow, and Forrest.
5996. *Mr. Gummow.*] What do you say was done in the case of No. 112? I find that we took an ordinary agreement under seal, with a cash deposit of £870 from Mr. M'Sweeney as security.
5997. No other bond? No.
5998. As to 101, I believe you took a bond only without a deposit? I think so.
5999. Who were the bondsmen in the case of 101? I could not recollect; I have dealt with so many contracts recently.
6000. I suppose you could furnish us the information as to who were the sureties in the case of 101? Yes.
6001. You took sureties for Gilliver's contract? Yes.
6002. In that case will you produce the particulars also—that is, the names and nature of the sureties? Yes.
6003. *His Honor.*] Do I understand that sureties had been taken in the case of a good many contracts or only in the case of a few? At about the time of the banking crisis we had to help the contractors very much.
6004. *Mr. Gummow.*] Could you furnish a list showing all the contracts upon which sureties were taken instead of a cash deposit within the last five years? It would take some time, as I deal with so many contracts. I am now dealing with about 7,000 a year.
6005. Suppose the question were confined to sewerage contracts? Then it would not take me very long—that is, going back to 1891.

John Mann sworn and examined :—

- J. Mann. 6006. *Mr. Parkes.*] What is your position? I am a clerk in the Registrar-General's Office.
- 29 June, 1896. 6007. Between the months of April and June, 1895, was there any property registered in your office in the name of George Forrest? No.
6008. Was there any property registered in the name of Carter, Gummow, and Co.? I did not search for that. We were instructed to search for property registered in the names of George Forrest or James Gillan.
6009. During the time I have named was any property registered in the name of James Gillan? No.
6010. *Mr. Smith.*] When you speak of the registration of property, in this instance you mean under the old Act? Yes.
6011. That would be registration of deeds? Yes.
6012. You mean the registration of vendors and mortgagors under the old Act? Yes.
6013. You do not find the names of Mr. Gillan or Mr. Forrest in connection with any registration in old branch? No; I have looked through the list of vendors and mortgagors.
6014. You could not say whether their names appear as purchasers? I could not say.
6015. *His Honor.*] You cannot say that no property stands at present in the name of George Forrest or James Gillan as purchasers, they being therefore the present holders? I cannot say that. Our index relates only to mortgagors and vendors.
6016. *Mr. White.*] You come from the old branch? Yes.
6017. Your index would not show any dealings with Mr. Gillan or Mr. Forrest unless as vendors or mortgagors,—the index of your branch would not show anything else? I could not tell you anything but that, unless we were to go through all the deeds.
6018. That would take some time? Yes.
6019. You do not know about the Real Property Office? I am not in that office.
6020. You have not searched there? No. A clerk, who is also in attendance to-day, will be able to give you information on that point.
6021. *His Honor.*] Do I understand that you cannot by any means, except searching through the deeds one after the other and examining the names of the parties, discover under the old Act who the present holders of land are? No; we index only vendors or mortgagors.

Henry Armstrong sworn and examined :—

- H. Armstrong. 6022. *Mr. Parkes.*] You are in the Land Titles Branch at the Registrar-General's Office? Yes.
- 29 June, 1896. 6023. Have you been able to find in your Branch any registration of property, between the period from April to June, 1895, in the name of either George Forrest or James Gillan? There is no such registration.
6024. You could not tell us if, at the period to which I refer, a deed was registered in the name of Carter, Gummow, & Co.? I did not look that up.

John

John Carter recalled and further examined :—

6025. *Mr. Parkes.*] Will you explain how it is that on Friday last Mr. Forrest stated in his evidence that he was the possessor during the months of April, May, and June, 1895, of a property at North Shore, called the Lodge property ;—was he the full possessor of that property? No ; only part possessor.
6026. Will you describe the circumstances under which he was a part possessor? Some time ago the old combination of Carter, Snodgrass, and Forrest, bought the Lodge Estate at North Sydney at a mortgage sale. It would be more correct to say that I bought the property ; but the transaction happened four years ago, and I cannot remember all the particulars now. I know that Mr. Snodgrass and Mr. Forrest afterwards agreed that it should become part of a joint speculation or estate. The deeds were made in my name, and remained in my name. A deed of trust was executed by me protecting the other parties' interests : and that, I think, is shortly the history of the transaction.
6027. *His Honor.*] What shares did they hold? Equal shares.
6028. And there were only three of you? That is all. Myself, Mr. Snodgrass, and Mr. Forrest.
6029. *Mr. Parkes.*] Who were the mortgagees from whom you bought the property? I cannot tell you after this lapse of time. I know that it was sold by Clarke & Co. I do not know who the mortgagees were. If I am not mistaken there was a second mortgage on the property.
6030. What did you pay for it? £5,400.
6031. What mortgage remained upon it? £3,000 remained upon it.
6032. What was the date of the purchase? I could not tell you.
6033. In what year was it? I could not tell you now.
6034. Where were the deeds lodged? They were in the possession of Sir William Manning.
6035. Did he advance a certain sum of money on them? Yes.
6036. Was it about £4,500? It is now, but it was not then.
6037. What was it then? £3,500, or £3,000, I do not know which. The property has been vastly improved since we bought it.
6038. I suppose the item of £52 16s., which appears in your Bank-book so often, represents the payment of interest upon the advance? Yes.
6039. As to Mr. Gillan—does the firm own his property too? They do not.
6040. Do you know anything about Mr. Gillan's property? Nothing. I might say, to settle your mind on that subject, that Mr. Gillan might be called a perfect stranger to me. He is almost as much so as you are. I suppose if the whole of the time I have spent in Mr. Gillan's company were added together it would not amount to more than three days.
6041. That may often occur between partners? But from your questions I might be supposed to be in intimate touch with him, whereas I really know nothing about him.
6042. Have Carter, Gummow, & Co., at the present time, any further property in New South Wales besides the Lodge property? Yes.
6043. What properties are they? We have two or three allotments at North Sydney, and a cottage and land at Marrickville.
6044. You have not a cottage at Dulwich Hill? No.
6045. The cottage to which you refer would not be the cottage referred to by Mr. Maddison as Mr. Gillan's, would it? No.
6046. *His Honor.*] Will you hand me a rough sketch showing me the boundaries of the North Shore property? Yes.

J. Carter.  
29 June, 1896.

John Young sworn and examined :—

6047. *Mr. Parkes.*] You are a contractor? Yes.
6048. You have been following that business in Sydney for some considerable time? For about forty years.
6049. You are also Mayor of Annandale? Yes.
6050. You have occupied that position during the time Messrs. Carter, Gummow, & Co. have been carrying out contracts in that district? Yes.
6051. Have you not had occasion to write to the Government complaining of the way in which they were digging up your streets? Yes.
6052. On several occasions? Yes.
6053. Will you describe to His Honor what they were doing? I thought, as Mayor of Annandale, that their breaking into our streets without giving us notice of any kind was a rather peculiar proceeding. We wrote from the Council Chambers both to the Government and to the contractors stating that we could not allow such a thing to be done unless we received proper notice, as we considered that we had the custody of the streets.
6054. Did Carter, Gummow, & Co. carry out their works there to a large extent? Yes ; to a very large extent in Annandale.
6055. Will you describe to His Honor how their digging operations affected your streets? They dug shafts down for the purpose of tunnelling. Where there was high land they would tunnel, and where the elevation of the land suited they would cut open trenches. We objected to their taking our metal, and also the material, because we thought that it belonged to the corporation.
6056. Did they not go further, and take material from your streets other than where they were actually working? I do not know that they did that.
6057. *His Honor.*] Do I understand that instead of the metal which they got out of the open trenches or from the heads of shafts being put upon the streets again they utilised it themselves for their own purposes? I do not know what they did with it. I know that they took a great deal of the material, and we objected to their taking it because we thought it belonged to the municipality.
6058. They did use some of it then? There is no doubt about it.
6059. *Mr. Parkes.*] Did they use it for their concrete? I cannot say. Of course I did not watch them.
6060. Have you noticed the two aqueducts which are being constructed over Johnstone's Creek and White's Creek? Yes.
6061. Have you ever paid much attention to the method on which they are being built? Yes.
6062. Are they being built in any but the ordinary way as far as the putting of the compo. into position is concerned? They are a compo. or concrete construction. I should call it concrete.

J. Young.  
9 June, 1896.

- J. Young. 6063. But if the specifications say 3 of sand to 1 of cement? That would be compo., of course.
- 29 June, 1896. 6064. What should you say would be the difference in cost between 3 to 1 compo. and bluestone concrete of 5, 3, and 1? I should like to read the specifications before giving you an answer.
6065. What I want to know is, whether, in your experience, compo. is cheaper than concrete? If you compare a 3 to 1 compo. with a bluestone concrete of 5, 3, and 1, of course a good deal would depend upon the size to which the bluestone was broken.
6066. Suppose it were half-inch or inch gauge? Then I think the bluestone concrete would be a little bit the cheaper.
6067. Have you not at different times had to make up compo? More than anyone else in the country, perhaps.
6068. Both concrete and compo.? Yes.
6069. Have you ever used in your constructions a mixture of the 5, 2, and 1? Yes; I have used it for Government work.
6070. Have you ever used it on the method in which it is being used at Annandale? Well, I have used concrete in conjunction with iron-work.
6071. Some years ago you introduced a system of building arches in this Colony of concrete and iron? Yes.
6072. Would you describe the method in which you did it? Well, it is over twenty years ago. At that time concrete was not much used in this country. I advocated its use in a peculiar form. I used concrete for the roofing of houses, about twenty years ago, in much the same way as it is being used in connection with these arches. I called the attention of the architects of Sydney to what I was doing in this respect. They all met and examined the houses, which are standing at the top of William-street, to which I applied the method. They are entirely roofed-in with the construction to which I refer, and, curiously enough, they are very similar in construction to the method which is now being adopted. The way in which I carried out the work was this:—I put in the centres, and I then put about 5 inches of concrete upon them. Upon that I put an interlaced hooping secured to angle-iron abutments. As the so-called arches had not proper abutments, I secured the abutments so that they could not spread. The iron-hooping was interlaced in the centre of the concrete, the pieces of iron being about 4 inches apart. When the hooping had been put in I put in about 5 inches of concrete upon the top of that. That formed a concrete roof, which is, I think, very similar in construction to the work to which you are referring, except that the contractors in that case use  $\frac{3}{4}$ th rods instead of hooping. I myself think the hooping is a great deal better, because it presents a broader surface to which the cement can adhere. Round iron is more likely to draw.
6073. Has it not been a common thing in your experience to use iron in a lattice form? It has been very extensively used.
6074. In connection with buildings in this country? Yes, very extensively.
6075. Is there not, as a matter of fact, a patent already registered? I do not know anything about patents. I myself did not consider it worth patenting.
6076. Would you hesitate to use a grill or grid in compo. or concrete work if you wished to do so? No.
6077. You would not fear any patent? No, certainly not, seeing that I used the same construction about twenty years ago.
6078. You have noticed pretty closely the work which is going on at Johnstone's Creek? Yes.
6079. Will you observe the materials used according to the departmental plan of Contract 77, and tell me whether, from your knowledge of material, that construction would, generally, be more costly than the construction in the case of the Monier arches? Yes, I think it would.
6080. From the look of it you think there would be considerably more material? I think it is more costly, and it is better. The proportions specified would make good concrete if the sand were good.
6081. Is it not a fact that Carter, Gummow, & Co. are crushing sandstone out in that district? Yes.
6082. What class of sandstone is it? It is sandstone which I should not use for concrete. I should be afraid to use it, judging from my experience. I have used the same kind of sand, and I find that, as a rule, after a dry season has passed over, on account of the clay which is in the sand, there is a shrinkage. In one case I found that the arch itself had absolutely shrunk inwards away from the abutments. You could put your hand down between the concrete and the angle-iron, showing that the shrinkage of the concrete overcame the weight of it and pulled it together. In other cases I have found a similar result. The concrete should not have shrunk inwards, but the abutments were rigid, and therefore it shrank, and I anticipate a similar result from this construction.
6083. In spite of the iron? Yes; I have had iron in the same form; I have had a latticed hooping with the iron 4 inches apart. I do not care whether you have iron or not. Of course, if you use Penrith sand, a perfectly free washed sand, without the slightest particle of clay in it, you can get over the difficulty, but in the case of any of the sand round about Sydney there is so much clay in it that the concrete shrinks. The result in this case, I am afraid, will be that you will have cracked arches.
6084. If in a work of this kind you do use crushed sandstone, ought it not to be the best bottom block Pyrmont stone? I do not think any of it is any good.
6085. But supposing that kind of stone were used? I would use the best I could get—the freest from clay; but I do not think any of it is entirely free from clay.
6086. Do you think the top surface stone from the quarries round about Annandale would be likely to be free from clay? No.
6087. Would it make good sand? No; I do not like it. I have the strongest objection to it, speaking from my own experience.
6088. As well as being a contractor, you have taken a great interest in architecture? Yes, especially in concrete construction.
6089. And in architectural designing? Yes.
6090. Therefore, you know a good deal about geometrical design? Yes.
6091. Look at the elliptical arch as shown on the departmental plan for Contract 77, and tell me your idea of the cost of such an arch as compared with the ordinary segmental arch? Of course it is more trouble, because it has to be built from various centres. I would rather have an arch from one centre. [*Vide Appendix C.*]
6092. But which would be the more costly? An elliptical arch would be the more costly for centering, but not otherwise.

J. Young.  
29 June, 1896.

6093. Will you look at the arch in the plan of Contract 101, and tell me the depth of the arch? It is 14 inches in the crown.
6094. And the spandril? The detail says  $13\frac{1}{2}$  inches.
6095. What is the depth of the crown in the case of the ellipse arch in Contract 77?  $24\frac{1}{2}$  inches.
6096. Look at the spandril? It is a brick and a half or two bricks.
6097. Which do you consider would contain the greater quantity of material, the arch in the plan of Contract 77 or the arch in the plan of Contract 101, leaving the piers entirely out of the question, and taking the arch itself;—would not an ellipse arch with a big span necessarily have to contain a very great amount of material for its strength? More than a narrow arch, of course.
6098. You have said, I think, that a segmental arch was the safer? I think so.
6099. Is it not a recognised rule that an elliptical arch must be made stronger as compared with the other kind of arch? It should be, but it never can be.
6100. Speaking generally, if you were called upon to decide which was the better plan, that in the Monier plan in the case of Johnstone's Creek and White's Creek, or the plan for those aqueducts as prepared by the Department originally, which would you prefer to use, supposing there were a difference of £250 in favour of the Monier arches? I think I would take the brick construction.
6101. For what reason? I think from what I have observed that the sides of the culvert or sewer, or whatever you call it, are too thin in the case of the Monier plan. I think it will leak. And when you come to consider the liability to shrinkage and cracking, that again is not in favour of the construction. I do not think a saving of £250 justifies the use of the Monier plan.
6102. Your general opinion of that structure is that it will not be secure? I am afraid not.
6103. What period would be necessary to show the defects? I do not think you can say until after next summer what is likely to happen. I am speaking now from my own experience in work of a similar kind. It has been very unsatisfactory, and I think in this case it will let the water through.
6104. As a matter of fact the very highest class of cement will let water weep? Yes; I have always found it so.
6105. What is your opinion of iron put in concrete should it become wet? I have a very good opinion of iron put in concrete. I believe that the putting of it into concrete arrests rust.
6106. But what effect is produced upon the mass if the iron rusts? It depends upon the condition it is in when the adhesion of the cement takes place.
6107. You think then that the cement preserves the iron from rusting? I think it arrests rust, at any rate.
6108. But should the rust get to the iron, what would be the effect upon the mass? If there were a crack, and the water got to the iron, it would probably rust it through if the iron were not very thick.
6109. But would not the rust accumulating on the iron split the material surrounding it to pieces? Yes.
6110. It will even split stone of great strength? Yes; but you are now speaking of a different matter. If you put iron in stone and run it with lead it will burst the stone, because you can never get the lead sufficiently tight to prevent the dampness from getting between the lead and the iron; in that case the iron corrodes and bursts the stone; but that is not the case where cement is used.
6111. You think cement would preserve the iron from rusting providing the iron is put in clean? Yes; as clean as it is ordinarily put in. There is generally a little rust upon it; the peculiar property of cement seems to be to hang on to the iron very closely.
6112. *His Honor.*] You do not think then that if there happens to be a little rust on the bar before the cement is put on that it will make any appreciable difference? No.
6113. You think it stops oxidation beyond the point to which it has gone? Yes; that is what I have observed when I have taken this work to pieces in the various forms in which I have used it.
6114. Have you had the upper sandstone round about Sydney analysed to find how much alumina it contains? No.
6115. Does the hard crystalline sandstone contain any? Just as much as the other.
6116. As much as the brown or red sandstone? Yes; it is only the iron which colours them.
6117. It results from the decomposing of the carbonate of iron? Yes; but all the Sydney sandstone is unsatisfactory for concrete.
6118. Because, as you say, it all contains clay? Yes. There is too much clay, and it shrinks. Of course you can make a perfect concrete with the thoroughly washed sand from Emu Plains. There is no clay in that.
6119. *Mr. Parkes.*] It is only in later years that crushed sandstone has been used? Yes; the sand is very similar to the sandstone formation itself.
6120. In former years none but river-washed sand was used? No.
6121. Crushed sandstone is never used in private practice? I never knew it to be used. I should fancy that washed sand would be clearer of clay than any sand made from crushed rock.
6122. *His Honor.*] Drift sand, I suppose, would have a small quantity of organic matter in it? Yes; but even then there would be some clay. I have sometimes used sand out of the gutters myself, and I have found that when it has been washed again it makes a very good sand, because you get the detritus from the bluestone off the streets, and the freer you get it from the clay, of course, the better sand it is for concrete. I have used it when economy has been in question, but I would not use it if it were not.
6123. *Mr. Parkes.*] You would not use it in an important structure? No, not in such a work as is shown upon the plan of Contract 77, for instance.
6124. *His Honor.*] You did not tell me what answer you received to the letters which you wrote to Carter, Gummow, & Co., and to the Department? I thought with the aldermen that if the firm were going to break up our streets we ought to have had notice. They should have asked permission. They simply said that they had an order from the Public Works Department, and that they were going to carry out the work. They simply put us at defiance.
6125. *Mr. Parkes.*] Did you get a polite answer when you did write? Well, that is the kind of answer we got. It was scarcely polite. I think that if they had wanted to break up our streets we should have had notice.
6126. *His Honor.*] Has any of this ground been filled in again yet? No; but we are responsible for it, I suppose, if they fill it in badly.
6127. At any rate, you do not know what they are going to do when they come to fill it in? No; they are not yet so far advanced as that in any case.

J. Young.  
29 June, 1896.

6128. Did I understand you to say that, in point of fact, an elliptical arch could never be as strong and as sound as a segmental arch? It can under certain circumstances—if the bricks of the arch are made to radiate to the centres on which the arch is struck. You get a strong arch then. But you must have your bricks made for that purpose.
6129. You must have several sets of bricks? Yes.
6130. But, supposing the bricks are laid in good cement, does it really matter, so far as the strength of the structure is concerned, whether they radiate or not in a large arch? No, not if they are bedded in good cement mortar. The radiation is not of very great consequence in that case. A large number of bridges have been built on our railways in that way.
6131. It is like a concrete arch in one piece, as it were? A concrete arch, if it is perfect, is in one piece. I have put up this concrete work fully 50 feet in length as flat as the top of this table, and that is standing now, showing that it does not depend upon the arch.
6132. *Mr. Smith.*] As to this objection, when was it that you made it, as Mayor, on behalf of the Borough of Annandale? About the time of the commencement of these works.
6133. When was that? I suppose it would be about two years ago now.
6134. Did you not go to Court about it—was not some application made to the Court? We felt so sore about it that we were inclined to go to Court, although we thought we had no chance.
6135. You were told, I believe, that the City of Sydney applied for an injunction in a similar matter some eight or ten years ago, and that it was refused? We were told that, but we found upon consultation with our solicitors that we had no case. That did not alter our opinion. We thought that what had been done was very discourteous.
6136. I suppose that you know that this system, called the Monier system, has attracted a great deal of attention on the Continent and in America? Yes.
6137. Have you studied any of the works and the discussions on the system? No, I have not.
6138. Have you read of any tests of the system which have been made abroad? No.
6139. *His Honor.*] Did you notice the way in which they put the grill into the arches? Yes. No doubt it is very good as far as it goes, but I do not think there is anything new in it.
6140. *Mr. Smith.*] Have you had any contract under the Government for any of these sewers? Yes; I had a sewerage contract at Cook's River.
6141. How many years ago is that? Nine or ten.
6142. What sand did you use in connection with those works? Drift sand.
6143. *Mr. Gummow.*] As to the cutting up of the streets at Annandale, do you remember myself and Mr. Carter calling upon you at your office in Park-street? Yes.
6144. And explaining to you under whose instructions we came to cut up the streets? Yes.
6145. Do you remember that we apologised to you, and explained to you that no discourtesy on our part was intended to the Borough of Annandale—that we had instructions to do what we were told, and not to ask any other people for further instructions? I do not think you made any apology, but I think you said you were doing it under instructions from the Department. I think I told you that you might have been courteous in the matter.
6146. Do you not think that the mere fact of our calling upon you was an act of courtesy, even supposing we had made a mistake before? That was after the mischief was done.
6147. So far as we were concerned there was no mischief at all? If you think that what you did was sufficient, well and good; but I think that before breaking into our streets you might have consulted the municipality.
6148. Allowing that a mistake was made, and that there was a discourteous act on our part in the first instance, do you not think that we did our best to atone for it by calling upon you and explaining our position? You did that, certainly.
6149. As to the stuff that was removed, do you know whether the Annandale borough carts take any of it away? They take some.
6150. They get all that we have not put back, do they not? All that you do not want, I believe.
6151. We have to deal with your street superintendent? Yes; I do not interfere in the matter.
6152. As to the matter of bluestone concrete, Mr. Parkes asked you which you considered cheapest, a 3 to 1 compo. or a 5, 3, and 1 bluestone concrete, and you said that bluestone concrete would be a little bit cheaper? Yes, I think it would be.
6153. Do you consider that a 5, 3, and 1 bluestone concrete would be cheaper than a 5, 3, and 2? The latter would be dearer by 1 of cement to the same quantity.
6154. Which would be cheaper, a 5, 3, and 2 bluestone concrete or a 3 to 1 compo.? That wants a little calculation. If you had 5 of metal, 3 of sand, and 2 of cement, you would use two and a half casks of cement to the cubic yard. If, on the other hand, you used only 1 of cement, it would be about half the quantity, of course.
6155. Which would be the cheaper? The use of the 2 would be the dearer, of course.
6156. Which would make the better article? The 5, 3, and 2.
6157. You say you paid particular attention to these arches when they were being built? Yes.
6158. Do you know whether the arches are built of compo. or concrete? I have not been on the work when the mixing has taken place, but on going to the work I found there fine bluestone—I should say about  $\frac{3}{4}$ -gauge—and I presumed from that it had been used. Mixed with better sand, it would make a good concrete.
6159. What sand was being used? Crushed sandstone.
6160. Do you know whether it had been put through a crusher? Yes; I could see by the texture of it that it had. Of course, I had not seen it crushed; but I could tell from the feel of it also.
6161. Do you know where it came from? I presume it came from somewhere near the city.
6162. You know where the crusher is in that neighbourhood? Yes.
6163. Is it on your property? I do not think so.
6164. Is there a crusher on any of your property? No, I do not think so.
6165. You do not know of your own knowledge whether any of the sand came from the crusher? I could only take the sand as it was. As I tell you, I felt some of it.
6166. Do you know whether it was local sand from Annandale or Balmajin, or from where it came? No; I simply took the sand as I saw it in the heap.
6167. Have you ever tested different sands? Yes.

6168. Have you tested sand of a nature similar to that which we are using? Yes; I have tested all the sandstone near Sydney. J. Young.
6169. I mean for the strength of the sand? Yes. 29 June, 1896.
6170. Do you consider that that sand will stand as great a tensional strain as Nepean sand? I cannot say that I do.
6171. If it did stand as big a strain, would you consider it good? I should not, because it contains clay, which is fatal, in my opinion, to the making of good concrete.
6172. You consider that a small quantity of clay is fatal to the making of good concrete? Yes, any quantity at all. There is quite enough clay in the cement as it stands. By adding more you spoil it.
6173. Do you know what is the use of the iron in the concrete? Yes, of course.
6174. With what object is it put in? To overcome a bond, as it were—whatever strain is thrown on to the iron instead of on to the concrete.
6175. What strain would that be? There are various strains, of course. The weight of the material, in itself for instance, has to be considered. It must be held up. The material put in does that, and binds it together, doing in a less degree what a bond of a brick or piece of stone would do by adhesion.
6176. If this iron holds up the work, and if there were no iron run into it, do you think the arch would tumble down? I do not think it would absolutely tumble down; but you could not make it so slight as you are making it in this case, you would require a greater thickness. I think the iron is beneficial.
6177. Do you know what tensional and compressive strains come upon the arch? No.
6178. As to leakage, you said that no cement would hold water? A very neat cement perhaps might do so; but there would be a great danger of its cracking.
6179. What head of water are you speaking of? I mean the water as it would flow through the sewer.
6180. About 3 feet of head? I presume it would vary. For instance, you would get some storm-water in sometimes. You could not help it.
6181. What would be the height of the sewer? It looks to be about 5 feet; but I have not measured it.
6182. Do you know whether it would run full during a storm? I do not know; there may be escapes.
6183. You do not know whether there are any or not? I presume there would be some.
6184. You do not consider that the cement would stand—you think it would leak? I fancy it would leak. I fancy you will find a dampness along the whole length of it.
6185. That is your opinion. Yes. I should be rather afraid of it if it were mine. I have had so much experience in these concrete structures, and I know the danger attending them.
6186. As to the expansion and contraction of cement, have you considered that? It contracts; it never expands.
6187. Do you consider that neat cement contracts more or less than 1 to 1? One to 1 is very extreme.
6188. Which would contract the more, neat cement or 1 to 1 compo.? Anything containing sand would contract because you cannot fill up the whole of the interstices.
6189. Have you noticed a 1 to 1 compo. when it has been used? Yes.
6190. Also, 1 to 2 and 1 to 3? Yes.
6191. Have you noticed any difference in the hair-cracks in these different kinds of compo.? There are more hair-cracks in cement nearing neatness than with a proper amount of sand.
6192. Do you know whether iron expands or contracts? Yes.
6193. Do you know whether iron and a 3 to 1 compo. expand and contract equally, or practically so? No. I do not know whether the expansion and contraction would be equal. I should rather think not.
6194. In your opinion, would it be equal or not? I do not see how it could be equal, because the concrete would not expand. The iron would expand and contract.
6195. *His Honor.*] Do you say that if you get concrete into a state of absolute dryness and then heat it that it will not expand? If you put it in dry it would not be concrete.
6196. But suppose you waited until it was thoroughly set, so that there would be absolutely no water left in it? Then it would have contracted all that it intends to contract for the time being; but after the heat of the summer it will contract in spite of you, just as ground will crack.
6197. You mean that it is always contracting? It may eventually reach a stage at which it will contract no more. It will, however, contract sufficiently to cause cracks. That is my objection to it.
6198. *Mr. Gummow.*] As to this concrete and ironwork, you have said that you built some houses at the top of William-street, and that you there used this construction in very much the same way that it is being used upon these Monier arches—what did you mean by that?—Did you put in compo with iron bars? I had hoop-iron interlaced, 4 inches apart.
6199. Did you use compo. or concrete? We used concrete, not compo.
6200. What was the object of putting in the iron? To strengthen it. I considered that as the concrete was deprived of bond of every description—as every mixture of that class is unless it is thoroughly set—the introduction of the iron would make it into one mass, and would answer the purpose. The work is there, and can be seen at any time.
6201. Does it leak? It cannot leak. The concrete would leak if water came on to it, but there is tiling over the top of the concrete to prevent the water from getting through.
6202. Do you know the use of the iron in these arches at Johnstone's Creek and White's Creek? Yes.
6203. What is the object of it? I presume it was put in with the same object as I put in my lattice hooping. It cannot hold the abutments, and I do not think it is required to hold them, because they are good enough in themselves. It can only have one effect, and that is to give the lateral and transverse bond that you require. If you filled the structure with iron you could not do more.
6204. Is this grill-work put into the centre of the thickness of the arch? It seems to me to be a little more on the outside.
6205. Is there any object in doing that? I presume so. I do not know it myself.
6206. You do not know whether there are any tensional or compressive strains to be considered in that connection? I would take my own practical experience in these matters before any theory.
6207. Regarding patents, have you any knowledge as to whether a patent is valid or invalid? None whatever; but I may state with reference to that matter that I used Tyerman's patent hooping at a time when somebody had a patent here. I was sued for using it, although the iron came from Tyerman's, in England. It was found in the course of the proceedings that the iron had been used in the country before the patent was taken out for it, and that therefore no action lay.
6208. *His Honor.*] Was that used in a brick wall? Yes. 6209.

J. Young.  
29 June, 1896.

6209. *Mr. Parkes.*] What case was that ;—who took proceedings against you ? It happened in Victoria. Proceedings were taken by a person named Cope, who had the patent in that Colony.
6210. *Mr. Gummow.*] Do you know whether the patent laws of Victoria are the same as in New South Wales ? I do not.
6211. As to the concrete arches—do you consider that concrete arches will stand in the same way as compo. arches ? Taking the compo. and concrete as described in the specification, I should prefer the concrete.
6212. For what reason would you prefer the concrete ? Because of the adhesive properties of the cement ; I should think it would adhere better to the rough small bluestone than to the other material.
6213. You prefer it for strength ? Yes.
- 6213½. But having regard to climatic changes, which would stand better ? I do not think there would be much difference so far as that is concerned. My strong objection consists in the use of the sand. If you put good sand into it, I think it would be an excellent job.
6214. Then the question of our making a good job depends upon our having good sand or not ? Yes.
6215. Providing the sand were good, you would be satisfied that it was a good job ? The sand I mean is the Emu Plains sand—the sand from which concrete is made for the wooden blocks. I was the first to draw a specification for making concrete for the wooden blocks. I have used it ever since, and it has answered admirably. In my opinion, in cases where it does not answer well the sand used has contained clay.
6216. Still in this case you say that if the sand were good it would be a good job ? Yes.
6217. *Mr. Parkes.*] You must recollect that the arches upon the Monier plan are 82 feet from centre to centre ? Yes.
6218. Is that not a very long arch in which to trust to any cement construction ? It is longer than I should have cared to construct it myself.
6219. Even supposing good sand were used in such a construction, if the arch were of the depth shown upon the plan, would there not be a risk of contraction ? I think it is an extreme length for concrete or compo.
6220. Is there not an element of danger, so far as contraction is concerned ? Yes.
6221. Where you crush sandstone for sand, what effect has the crushing upon the sand ? The crushing makes the crystal finer than it otherwise would be. In the case of the Sydney sandstone, it is too fine as it is.
6222. The crushing, then, would also be a dangerous element in the sand used in this compo. ? Yes. I would rather have coarser, cleaner sand.
6223. *Mr. Gummow.*] I think you expressed an opinion that cracks might be expected to show themselves in this work next summer if they were going to show at all ? If it were my job I should be afraid, judging from my past experience, that cracks would result. I do not say that it will necessarily take place in this structure.
6224. If the work were guaranteed for three years, would you consider that term long enough ? The cracks ought to come out in that time.
6225. If they do not come out in that time they will never come out ? I should consider the structure safe after that.
6226. *His Honor.*] Even if we had another temperature of 108·5 ? Yes ; but it would try the structure.
6227. *Mr. Gummow.*] You think the sand which is being used is from crushed sandstone ? Yes.
6228. What do you mean by crushed sandstone ? I mean the sand from stone which had been put under rollers. It is not washed so that you get the clay out of it, and that is my great objection.
6229. But is it sand which has been put through a crusher ? I take the sand as it is, and I consider that it is sand from crushed sandstone. I do not object so much to your crushing the stone as I object to the stone itself. I say that there is too much clay in the sandstone round about Sydney to permit of good concrete being made from the sand.
6230. In answer to a question just now, you said that in the process of crushing the crystals were made finer ? The sand is the detritus from granite originally, and that is a crystalline rock.
6231. Suppose the sand is not crushed in such a way as to make the crystals finer, would it not be better than sand which is ordinarily taken from a crusher ? The sand from the Sydney stone, whether it be drift or solid rock, has been sand over and over again before it is found in its present form. The crystals have been worked down too fine in this process. They are not the crystals which come direct from the rock in the first instance. They have been washed by the sea again and again, rendering them as fine as you see them to-day. They are too fine for the purpose for which they are sometimes used.
6232. In the sand you saw at the works had the crystals been crushed into dust ? Yes, compared with what they originally were.
6233. But I mean artificially ? Yes ; undoubtedly the crushing will make the crystals smaller.
6234. You consider that in the sand you saw the particles of sand had been crushed ? It is crushed too fine ; that is what I think.
6235. What I mean is—had the particles been crushed at all, or were they in their natural state from the sandstone ? Even in their natural state in the sandstone they would be too fine for the purpose.
6236. *His Honor.*] What you say is that they are too much water or weather worn ? Yes ; that is the worst of the Sydney sandstone. It is too fine in the rock, and it is fine in the drift, whichever way you take it.
6237. *Mr. Gummow.*] Do you know from what place the standard sand used in the Government departments is obtained ? I do not know anything about what the Government do. They do some very curious things sometimes.
6238. Do you know whether they take the sand from crushed sandstone as the highest class of sand ? I believe they would use the washed sand I speak of if it were not for the cost of it.
6239. I am referring to the standard sand—the sand to which we are referred for information as to what good sand is ? Sand should be free from clay, or else it is not sand, properly speaking. It is a mixture. If you get sand free from clay, you get a perfect sand.
6240. As to the sand used by the public departments—do you know what their standard sand is ;—are you sure that there would not be any clay in it ? That I do not know ; but I presume they know what good sand is.
6241. Do you know whether the sand we are using would stand a higher test than Nepean sand ? I should

- should not believe it. It would be totally against my experience. I should say from my forty years' experience that an error had been made somehow.
6242. If you had heard that the sand we were using would stand a higher test than the Nepean sand you would think there was a mistake somewhere? Yes.
6243. *Mr. Smith.*] Have you tested the sand which has been used at Annandale? I have only my experience to go upon.
6244. You say you have handled it? Yes.
6245. And that is the only test to which you have subjected it? Yes.
6246. *Mr. Parkes.*] Supposing bad sandstone is crushed? Then, of course, you could not get good sand. No man has done more work in concrete in the Colony than I have done. I am of an inquiring turn of mind, and in connection with this particular kind of structure I have endeavoured to ascertain the why and wherefore of things. You must have a good deal of experience before you can find out many of these things for yourself.
6247. *His Honor.*] I understand you to say that it is not a question of tensional or compressive strength;—you say that in the case of concrete made from sand containing clay there is the risk of a slow, gradual, shrinkage? Yes, that is the danger; and I found that belief upon my experience. Of course, if the thing does not occur so much the better.
6248. Then you would not use crushed sandstone? No; because it contains clay in just the same way as does the ordinary drift.
6249. *Mr. Gummow.*] If an arch had been built twelve months ago, and were still standing showing no signs of cracking, having been made out of a compo. including sand from crushed sandstone, what would you consider the reason of its standing to-day? I should want to know when the work was done and how it was done. I should like to give it a little more time, say, to the end of next summer. Twelve months ought to show all the weak points if there are any. Of course, it depends upon the following summer. If you get a dry hot summer the work will have a good trial.
6250. What do you consider last summer? Quite hot and dry enough.
6251. And if an arch stood through that, you would consider that it had been subjected to a good test? The arch standing by itself is no test at all, if you are referring to your test arch. You put it against your abutments singly, by itself. I have not seen the arch; but the probability is that whatever the effect the climate might have upon it you would not, from its position, see the effects.
6252. But if it contracts you ought to be able to see the effects of the contraction? It may be that your abutments contracted also.
6253. *His Honor.*] You mean that they possibly closed in with the arch? Yes. If they were fixed with the arch they would come in with it. If you want a perfect test you must have an absolutely rigid abutment. Unless you have that there is no proper test.
6254. *Mr. Gummow.*] Would not the cement mortar, or concrete, shrink away from the iron in such a way as to show the shrinkage? It might contract, but it would drag the abutments with it. You have only temporary abutments.
6255. But suppose the abutment is strong enough and heavy enough not to be dragged? Still, you could not test a single arch by itself.
6256. You would not consider it any test if the arch stood through last summer? I do not think it is a good test. You must have your abutments perfectly rigid, and then your arch must also be perfectly rigid.
6257. Can you get that perfect rigidity? That is the only way to test the structure.
6258. You do not know whether, in the case of this test arch, the abutments are rigid? I do not know.
6259. If they are, ought not the cracks, if there are to be any cracks, to show by this time? No; I do not think it is a test at all.
6260. Why not? I will give you my reason, and it is this: You must keep the springing of your bow, as it were, as rigid as possible. If it comes off a certain line, even to the extent of a  $\frac{1}{4}$  inch, there is shrinkage, and that would draw the abutments.
6261. *His Honor.*] Supposing that there is a grid of iron in the structure? It will do just the same thing.
6262. If it were in the intrados of the arch, close to the lower curve, would it be possible for the compo. to shrink without cracking the extrados of the arch? If it were distributed over the length it might do so. A peculiarity of concrete is that it goes sometimes where you do not expect it to go.
6263. *Mr. Smith.*] I suppose that by an ordinary test you can find out the strength of the sand? I should be dubious about ordinary tests.
6264. Supposing there were a certain amount of clay, which you say is a dangerous element, in the sand, could you not discover it by an ordinary test? You could tell whether there was any clay in it by analysing it, certainly.

Walter Alexander Smith sworn and examined:—

6265. *Mr. Parkes.*] You are an officer of the Works Department? Yes. I am a district engineer.
6266. Not long ago you made a report to Mr. Hickson about the construction of a culvert over a creek at Strathfield? Yes.
6267. What creek was that? I do not know of any name for the creek, but there was an old culvert there.
6268. It was a small drain? Yes.
6269. Will you tell me the material you intended to use in the culvert as originally designed? The Monier plan was the one I originally proposed, but the Road Superintendent had suggested an ordinary buckle-plate culvert.
6270. What was the width of the road at that point? I have a description of the culvert. It is 55 feet long, with a 5 ft. 6 in. span.
6271. What I want to know is, what was the nature of the original plan? There was no original plan apart from the suggestion of the local officer.
6272. What was the nature of it? He wrote reporting the dangerous state of the old culvert, and recommended that a sum of money be provided for a new one.
6273. How much? Upwards of £300.
6274. Where is his report? There was no report; there was merely a short minute. It is with the papers, I suppose.

W. A. Smith.  
29 June, 1896.

- W. A. Smith. 6275. *His Honor.*] Did he make any estimate? There was no estimate in detail. The minute referred to the bad state of the culvert, and recommended that £300 be provided for the erection of a new buckle-plate culvert. I was divisional engineer at that time, and this Monier system having come forward I recommended that the culvert should be built upon it.
- 29 June, 1896.] 6276. Of course you went into calculations to discover whether it would be cheaper? I went into a rough calculation in connection with the Monier culvert, and I saw that it would be cheaper than the culverts we had been building with buckle-plates.
6277. *Mr. Parkes.*] Will you let us know how these buckle-plate culverts are built—they have stone and concrete abutments? Yes.
6278. Of what thickness are they? About 12 inches.
6279. Between these, the buckle-plates are suspended? If it was a single opening the buckle-plates would span right across.
6280. Would the 5 feet 6 inches be covered by one buckle-plate? They are of different sizes; as far as I can remember, the largest is 3 feet 6 inches.
6281. The buckle-plate forms the top of the arch? Yes.
6282. Over that you fill in with tarred metal, and that makes the roadway? Yes.
6283. Could you adopt a 4½-inch brick arch instead of buckle-plates? I have never seen it.
6284. Why could you not adopt a 4½-inch brick arch? I do not think it would give a sufficient factor of safety.
6285. We are told that the concave surface of the 4½ inches will stand 2,020 lb. of pressure to a single brick;—what would it be on the convex face? This would be the tensile strength of the mortar; the compressive strength would be about ten times that amount.
6286. Then a 4½-inch brick would do? I have not gone into the matter, but I should not like to build such a structure. You are assuming that all the material is of the very best and the strongest that could be obtained. I have not gone into the question of a single-brick arch.
6287. The only difference between an ordinary culvert and a culvert on the Monier system is that there are Monier plates instead of buckle-plates? That is so; but in addition to that the walls would not require to be quite so high, because the arch would stand lower down on the walls; there would be a saving of concrete in the walls.
6288. That would not be much in a 5-foot span, would it? In a small case like that it would be slight, but there would be a difference.
6289. What would be the cost of buckle-plates? I have had nothing to do with them for over two years, and I do not know the present price, but I suppose it would be about £6 a ton; the price varies every year.
6290. What was the price which you paid for the Monier plates? The arch was built in sections on four separate days, and it cost £22 16s.—that is simply for the arch.
6291. According to the original idea you would have had stone abutments? Stone or concrete.
6292. When you adopted the Monier system, what abutments did you have? Concrete.
6293. Did you report afterwards to Mr. Hickson as to the difference in cost between the original plan and the Monier? No; it was arranged in conversation with Mr. Hickson; the whole thing was done by day labour; Mr. Hickson and I had a conversation; I made rough calculations, and found that the Monier system was cheaper; I showed him from my figures that it would be cheaper, and he instructed me to proceed with the work.
6294. Did it come out 50 per cent. cheaper? I think it was about 30 per cent cheaper; the actual cost of constructing the culvert, exclusive of the removal of the old brick structure, was only £114, while the construction of culverts of equal length and capacity, in which brick or concrete and wrought-iron buckle-plates were used, had cost about £165.
6295. Did you take out a special estimate for the work at this particular place? No. We had been building culverts which would have applied to this place at Centennial Park, Stanmore, and in other places.
6296. Can you give us the cost and quantities of the culverts in those cases? They could be obtained. I should like to explain that when I built this Monier culvert I was divisional engineer of the metropolitan division. That office is now abolished, and all the papers relating to any work in the metropolitan district have gone, I suppose. I do not know where you would find the papers now. Of course the old contract-books can be turned up, and I should think you could find any information you would be likely to require about the culverts in them. So far as this particular Monier is concerned, I have worked out the cost, and I can give it to you, I think, within a few shillings. The actual cost of constructing the arch only I make as follows:—Sand, 4¼ cubic yards at 6s., £1 5s. 6d.; cement, 9½ casks at 18s., £6 3s. 6d.; iron, 3½ cwt. at 10s., £1 15s.; centering, say £6; labour, one man at 8s. and two at 7s. a day for six days, £6 12s.; tools and contingencies, say £1. The total would be £22 16s., or 79s. per cubic yard.
6297. Was it upon your report that Mr. Hickson wrote this letter, “I recommend this for the Minister’s approval. I might state I have just completed, with the permission of the patentees, a culvert on the Parramatta Road built on this principle, with most satisfactory results, financially and otherwise”? I cannot say. I know that Mr. Hickson did write a letter to that effect.
6298. On what date did you complete this culvert? About 24th July.
6299. Then if the letter from which I quoted were written on 18th July, 1894, it would be written before you had completed the work? Yes; but of course Mr. Hickson would be justified in saying that the results were satisfactory, because he had an experience in this case which tended to show the enormous strength of the arch, as when the first length of the arch was finished, through a misunderstanding, the heavy traffic of the Main Western Road was allowed over it when the mortar was six days old. The result, however, has been in every sense satisfactory. Not the smallest movement or crack has taken place, although the whole of the traffic over this culvert for five weeks had been confined to a 9-foot width. Of course, I had reported that to him.
6300. *His Honor.*] One-half of the arch would be in use at the date of the report, then? Yes; I imagine that it would have occurred perhaps in the first week in July.
6301. *Mr. Parkes.*] But, as a matter of fact, did not the second arch give way under the test? No.
6302. What occurred? There was an accident, was there not? No.
6303. *His Honor.*] Did something go wrong in the construction? A very trifling thing occurred, but it is scarcely worth mentioning. Mr. Davis spoke to me about it a few days ago. A small part of the compo., put up over night, got frozen and perished.

W. A. Smith.  
29 June, 1896.

6304. It got frozen before it was set? Yes; it was only a very small patch.
6305. *Mr. Parkes.*] What was the thickness of the Monier arch? Four inches on the top.
6306. What was the material? Three to one compo. with bars  $\frac{1}{4}$  inch and  $\frac{3}{8}$  inch.
6307. Was the portion of the arch which the heavily laden dray went over completed on 2nd July? I could not say.
6308. When did you start the work? Somewhere about the end of June. I do not remember the exact date. The only way in which I have been able to arrive at it at all has been by turning up my diary, which I see that I visited the place every second or third day from the 25th June to the 24th July.
6309. Therefore, if Mr. Carter, after a conversation with Mr. Hickson, offered to allow this patent to be used for a royalty of 15 per cent. on 2nd July, it would be during the time you were constructing the culvert? I imagine that that would be so.
6310. *His Honor.*] Have you compared the cost of the arch alone with the cost of the buckle-plate work alone to see what saving there would be, quite apart from the cost of the abutments or any other part of the structure? No.
6311. I understand that the 30 per cent. you mentioned just now as the apparent saving would be taking into calculation the abutments in both cases? The figures I then gave included the whole structure.
6312. So that comparing the spanning of the opening alone, that proportion of saving would be much larger in favour of the more economical plan? Yes.
6313. It might come to 50 per cent. and more at that rate? Yes; the arch in this case was built as cheaply as possible. I had a gang of men there who did the work as quickly as it was possible to get it done. They were all experienced men.
6314. When you got in your centering how did you proceed with the work? The centering having been put into place, the lattice work was constructed for a quarter of its length and put over the centering. Between the centering and the iron we had wooden chocks at the intersection of the bars. Then the mortar was thrown in and rammed, and as they worked up to the wooden chocks they were all withdrawn.
6315. How was it put in between the interstices of the grid? It was put in on the top and rammed in with a heavy rammer.
6316. Jammed through do you mean? Yes.
6317. It was not put through by handwork? No. We used the most heavy rammers—as heavy as a man could lift.
6318. You were not afraid of that bending the iron work? No; the compo. would squeeze under it at once. I inspected the arch the other day and I could not detect the sign of a flaw in it.
6319. I understand you put in the whole span across, a quarter of the width? Yes.
6320. *Mr. Parkes.*] Would it require more costly abutments to carry the Monier or the ordinary buckle-plates? They would be more expensive in the case of the buckle-plates, because you have to build the wall higher, the plates being flat.
6321. There is a saving in the abutments in this case then? Yes. The greater the rise in the arch the greater the saving in the wall.
6322. *His Honor.*] Did you fill in the spandrels with any particular material, or only with earth and metal? With clay, and metal on the top.
6323. You did not use concrete to strengthen the spandrels? No.
6324. It is simply the arch itself that is doing all the work? Yes.
6325. *Mr. Davis.*] Mr. Parkes asked you with reference to the thickness of the arch, your opinion as to whether a  $4\frac{1}{2}$  brick ring would be sufficient, and you had some hesitation in replying to his question;—is it not a fact that the crown of the arch at Strathfield is very near the surface of the road? Yes.
6326. In designing a culvert of that description, had you not to take that into consideration? Yes.
6327. Would not the concussion caused by the traffic probably damage the brick arch if it were put as near to the surface of the roadway as is the Monier arch? It probably would, especially if the bricks were at all defective.
6328. So that it would not be so much tension and compression that you would have to take into consideration as the concussion caused by the traffic? Yes.
6329. As to the buckle-plates, you say that the cost would be about £6 per ton;—have you not made some mistake there? I said I have had nothing to do with them for two years, and that I did not know what the present price was, but that I presume it would be about £6 per ton.
6330. You are not sure about it? No.
6331. Would the lifetime of a buckle-plate compare favourably or otherwise with the lifetime of a Monier plate? It would compare unfavourably.
6332. That is to say, the Monier arch would probably increase in strength, being stronger fifty years hence than it is to-day, whereas a buckle-plate deck would deteriorate through corrosion, and would have to be renewed? Fifty years hence the Monier arch would be in a better state than it is to-day, and the buckle-plates would probably have collapsed by that time.
6333. What did you say was the cost of the culvert per cubic yard? Seventy-nine shillings.
6334. Without taking into consideration the patent fees? Yes.
6335. Does that include the cost of material and labour? Yes.
6336. The centering in the case of such a culvert would be comparatively simple compared with the centering which would have to be used in an arch of a 75 feet span? Yes.
6337. A 75 feet span arch would cost considerably more as to centering than a small arch of this description? Yes.
6338. The £114 you gave, therefore, would include the side walls? Everything connected with the culvert.
6339. What would be your own estimate for a culvert built with buckle-plates and similar side walls to those which would be put in when the Monier arch is used? I have not got an estimate out. I pointed out to Mr. Hickson at the time, however, that, taking the cost of work just completed as a guide, a buckle-plate culvert would come to about £165. That estimate was taken out at the time from works which had been lately carried out.
6340. You say you pointed that out to Mr. Hickson? Yes.
6341. You were in constant communication with him during the time these works were in progress? Yes.
6342. You saw him three or four times a week or more? Yes.

- W. Smith. 6343. You frequently had conversations with him as to the progress of the work? Yes.  
 29 June, 1896. 6344. You said, I think, that the work was actually finished on or about 25th July? I believe that to be about the date.  
 6345. What was the last part of the work you did at that culvert;—was it not in connection with the gully shafts and the building of the gullies? They were built after the arch was finished. I presume the last work would be the making of the road.  
 6346. Would it not be likely that on 18th July the whole of the arch would be finished if the whole work was finished on 25th July, because you had then to repair the road and make it good, and to construct the gullies and connect them with the culvert;—would it not be likely, if the work was completed on 25th July, that the arch was finished on 18th? Yes.  
 6347. So that if Mr. Hickson wrote in the manner quoted by Mr. Parkes just now that would be quite correct? Yes; in any case Mr. Hickson had the first part of the arch to go upon before he wrote that letter.  
 6348. You are not in a position to say that he had not the whole of the arch to go upon? No.  
 6349. Supposing that on 18th July he wrote these words—"I might state I have just completed, with the permission of the patentees, a culvert on the Parramatta Road built on this principle with most satisfactory results financially and otherwise"? I may have informed him that the arch was completed.  
 6350. Do you not think it possible that you did? Probably I did.  
 6351. You have tested the arch within the last few days? Yes.  
 6352. You have made a careful examination of it? Yes.  
 6353. Did you find the arch as it was when you constructed it? Yes; it is absolutely intact; I could not see a flaw in it.  
 6354. You regard the arch as a success then? Yes.  
 6355. *Mr. Gummow.*] How long has the arch been built? Two years nearly.  
 6356. Do you consider that there is any likelihood of its giving way now after standing two years? None whatever.  
 6357. What is the quantity of the cement mortar in the arch?  $5\frac{3}{4}$  cubic yards.  
 6358. What have you put down as the cost of the centering? £6. That would be for a 14-ft. length.  
 6359. In constructing this work in short sections, you did not continue the whole 55 feet? No; the work was done in four sections.  
 6360. Would it have made any difference if the work had been done in one length? It was better to do it as we did it. We had to consider the traffic.  
 6361. But having regard to the question of the continuity of the whole work? It would not make any difference.  
 6362. Doing the work as you did in broken strips, it was absolutely sound? Yes.  
 6363. *Mr. Parkes.*] Would it have been much more costly, or otherwise, to put in a 14 or 9 inch brick arch instead of the Monier arch? I have not made an estimate in connection with brick arches, but I should imagine that they would cost more than the Monier arch.  
 6364. Very much more? I cannot say; I have not run out an estimate.  
 6365. *Mr. Davis.*] Since you constructed this Monier arch in Strathfield you have looked further into the question? Yes.  
 6366. I believe you wrote a paper for the Royal Society, which so far, however, has not been read at their meetings? No.  
 6367. That paper contains a good deal of valuable information in connection with the Monier arch, does it not? Yes.  
 6368. Would you hand it to His Honor? Yes. I have not read it before the Royal Society, but I thought it would be of interest to describe this arch, because it was the first one built here.  
 6369. *His Honor.*] The contents of the paper are, as far as you know, an absolutely correct statement of what you have learned from experience, and also worked out in theory? Yes.  
 6370. *Mr. Parkes.*] Is there a direct reference to this particular culvert in the paper? Yes; it contains a description of it.  
 6371. Does the paper deal also with its comparative cost? Yes.  
 6372. *His Honor.*] Will you kindly read the paper? Yes.

#### THE MONIER SYSTEM IN BRIDGE CONSTRUCTION.

It will probably be of interest to have a short description given of a small culvert built in July, 1894, on the "Monier" system, on the Main Western Road, at Strathfield; for, with the exception of an experimental arch of 30 ft. span, built and broken by Messrs. Carter & Co., at North Sydney, in May, 1894, this is the first structure erected on this system within the Colony. But, before describing this culvert, it would, perhaps, be as well to explain the advantages of the new method over older systems, by quoting from a paper on the subject by Professor Bauschinger, translated from the German by Mr. Baltzer, of the Sewerage Branch:—"The principle of this method of construction is to increase the extremely small tensile strength of cement and its mixtures, which is to its compressive strength in the ratio of 1 to 10, by imbedding wrought-iron bars in the mortar, in such places where the construction is subject to tension. The compressive strength of a mixture of 1 cement and 3 sand is from 2,000 to 2,450 lb.; the tensile only 200 to 245 lb. per square inch.

"The iron bars used are round, from  $\frac{7}{8}$  in. to 1 in. diameter, as found necessary, and are so placed that the stronger are in the direction of the tension, the thinner resting on the former, usually at right angles to them, thus forming a lattice-work. The bars are only held together at their intersections by thin binding wire, just sufficient to hold them in position during the process of packing the cement mortar round them, which will keep them in place when once set. If not sufficiently long the bars are jointed by a very simple method. They are so placed as to overlap each other by twenty times the diameter of the bars, and then tied together. The cohesion between iron and cement, which is, according to Professor Bauschinger,\* of Munich, 500 to 600 lb. per square inch, and which is not diminished by heat, is quite sufficient to form a bond. The lattice work is calculated to withstand all the tension the structure is likely to be subjected to. To achieve this it is only necessary to take the bars in the direction of the tension into consideration, as the others are only to distribute the pressure equally over the former. When the iron structure is finished, the cement mortar, usually of one cement to three sand, is pressed through the meshes in convenient thicknesses, of not over 9 inches, on to the centering, which is generally  $\frac{3}{4}$ -inch clear of the iron, and well rammed. In setting, the cement mortar shrinks and gets a firm grip round the iron; and as the cohesion between the two materials is very great, the whole forms one homogeneous mass. The physical properties of this combination are very favourable. The co-efficient of expansion of cement mortar is from 0.000137 to 0.000148, that of iron 0.000145 or nearly the same; and, even if a small difference should exist, the elasticity of the mortar is sufficient to equalise the difference. Further, in this combination the iron loses its unfortunate liability to oxidation, as cement has proved itself one of the best preservatives of iron. The very thin layer of cement surrounding the iron forms a silicate with it, very difficult to separate, which explain why iron in cement mortar does not oxidize. Not only does cement preserve iron, but it actually frees it from

\* Cohesion between cement and iron = 500 to 600 lb. per square inch; cohesion between compo. (3 to 1) and iron = 336 lb. per square inch.

from rust; as experiments have proved that iron bars covered with rust, if placed in cement mortar, become after a time perfectly clean. A structure of the foregoing description consequently combines all the good qualities of stone, its strength and immunity from injury by the weather, with the elasticity of the iron, and daily increases in strength rather than deteriorates. The advantages of this system, compared with other methods are." W. Smith.  
29 June, 1896.

- "1. Quickness of erection, without prejudice to durability and security of the work."
- "2. Immunity from injury by water."
- "3. Extraordinary power of resisting very high and variable temperatures."
- "4. Great strength."
- "5. Lightness, as compared with other structures in iron or concrete alone."
- "6. Saving in space."
- "7. Cheapness and neatness."

Following on the above statement in Professor Bauschinger's paper are numerous photographs and descriptions of railway and road bridges already constructed in Austria, Germany, and Switzerland. Before any work was undertaken in New South Wales under this system, Messrs. Carter & Co. built the before-mentioned experimental arch, which was of 30 feet span and 5 feet wide, with a versed sine of 3 feet; and the thickness of the arch at the crown was 4 inches. The mortar of which the arch was constructed consisted of one part cement to three parts sand; the bars in the line of tension were  $\frac{1}{4}$  inch diameter, while the cross-bars were of  $\frac{3}{8}$  inches in diameter, forming a lattice-work of  $2\frac{1}{2}$  inch mesh. An evenly distributed load of  $11\frac{1}{2}$  tons was placed on the arch, which caused a deflexion of  $\frac{1}{8}$  inch, or equal to a load of 210 lbs. per square foot. The arch remained intact, but unfortunately one of the abutments showed a slight movement.

The loading was then removed from that half of the arch adjoining the sound abutment, and the other half was loaded up to  $7\frac{1}{2}$  tons, when it broke. This would be equal to a loading of 274 lb. per square foot.

Taking into consideration that one of the abutments was too weak, and that this very sensitive arch was, for half of its length, without loading or stiffening of any description, the test can be looked upon as fairly satisfactory.

The invert and walls of the culvert at Strathfield are built of concrete, to the proportion of 5, 2, and 1, with a Monier arch 4 inches thick in the centre of cement mortar, composed of 1 part of cement to 3 parts of Nepean sand. Embedded in this mortar was a lattice work of 6-inch mesh, the rods in the line of tension being  $\frac{3}{8}$  inch in diameter, while the cross-bars were  $\frac{1}{4}$  inch diameter. The rods were tied at each intersection with binding-wire, and the under side of the lattice-bars were placed  $\frac{3}{8}$  inch from the intrados of the arch, and were maintained in this position during the ramming into place of the mortar by wooden chocks  $\frac{3}{4}$  inch deep, resting on the centering and supporting each intersection of the bars; these were withdrawn as the mortar of the arch was worked up to them. The lattice was also suspended by wires secured to temporary beams made to span the whole of the work. On the mortar being rammed into place round each of these suspending wires, they were cut off flush with the top of the mortar and left there. (It is now seen that a simpler and more effective means of maintaining the lattice-bars in their proper position during the ramming of the mortar could be arranged for, by making a large plate of neat cement of the required thickness, and breaking it up into small pieces about the size of a penny or, perhaps, a little larger, and placing one of these pieces under each intersection of the lattice-bars, and leaving them in: the rough edges of these broken parts would bond well with the fresh mortar.) When the first length of this arch was finished, and through a misunderstanding, the heavy traffic of the main Western Road was allowed over it when the mortar was only six days old: the result, however, has been in every sense satisfactory. Not the slightest movement or crack has taken place, although the whole of the traffic over this culvert for five weeks had been confined to a 9-foot width: and it is worth mentioning that, when the mortar was only ten days old, a heavy team from the Western districts, drawn by nineteen horses, and weighing  $9\frac{1}{2}$  tons, was taken over this culvert, with the result that the arch has retained exactly its original versed sine, while the mortar was not cracked or injured in the slightest degree.

The actual cost of constructing this culvert (exclusive of the removal of the old brick structure), which is 54 $\frac{1}{2}$  feet long, of 5 ft. 6 in. span, giving a waterway of 14.75 square feet, and including four gully shafts and three pipe connections, was only £114, while the construction of culverts of equal length and capacity, in which brick or concrete and WI buckled plates were used, has hitherto cost about £165.

Since writing the foregoing in August, 1894, several papers have been written on this subject, all of which go to prove the great value and economy of this system; which, although somewhat new to Australian engineers, has, under the name of "Bordenave or Sidero-cement System," been in use in France for upwards of forty years. A description of the system under this latter designation is given in vols. CXL, p. 413, and CXVII, p. 407, of the Minutes of Proceedings of the Inst. C.E., which almost entirely corresponds with Professor Bauschinger's account of the Monier system.

In vol. cxx Min. Pro. Inst. C.E., Mr. R. P. T. Tutein-Nolthenius makes the following observation in reference to a culvert built on the Monier system in Belgium in 1893:—

The author investigated by mathematical analysis the stresses and strains set up in the material, and became convinced of its trustworthy character, and also quotes several instances of its successful application.

In vol. cxi, p. 414, Minutes of Pro. of Inst. C.E., M. Mamy states that, among the advantages claimed for this system for water works, are that the metal is protected from deterioration, being everywhere embedded in cement, and that no vegetation or deposit of any kind occurs on cement in any climate.

6373. *Mr. Parkes.*] Did your office know anything about this Monier system before Mr. Baltzer introduced it? He was the first person who mentioned it to me.

6374. You did not know anything about it before that? No; but I had heard that a paper had been read at the Engineering Association some time previously. I had not seen it.

6375. How long before? I do not know.

6376. By whom was it read? I forget now. I may have heard at the time.

6377. *His Honor.*] Have you gone into the question of the proper sand to use for mixing with cement in compo. or concrete? Yes; I had charge of the testing of the cement in the Department some years ago.

6378. What conclusion did you come to as to the proper sand to be used in making compo. or concrete? Either clean river washed sand, similar to the Nepean River sand, or the best crushed sandstone.

6379. As to the best crushed sandstone, have you tested compo. or concrete made with it for any length of time? No; I used to use the Nepean River sand only when I tested the cement in the Department.

6380. What tests have been made in which crushed sandstone has been used, do you know? I have seen the results of many tests in which it has been used, but I do not remember them.

6381. They would be tests, I suppose, for tensile power and the power of standing compression, but they would not be tests in which shrinkage would come in as an element? I do not remember now. I do not remember the difference in the shrinkages of the different sands.

6382. Have you gone into the question whether the Sydney sandstone does not contain so much clay as to render it a bad sand for the making of concrete? No.

6383. *Mr. Davis.*] Supposing the sand contained clay, would it not be detected in both the compression and tension tests? Yes.

6384. Would not a quantity of clay materially affect the strength of the compo.? Yes.

6385. And it would be seen in both the compression and tension tests? Yes.

6386. If you tested any sand, and found that it stood a higher test than the Nepean sand, would you be content to use it? Yes, if I knew it was good sand.

6387. You would be satisfied to use it if it stood a higher test than the Nepean sand? Yes.

6388. You would feel assured from the test that you were using a good sand? Yes.

Norman Selfe sworn and examined :—

- Norman Selfe. 6389. *Mr. Parkes.*] You are a civil engineer? I am.  
 6390-1. Of considerable experience? Of many years' experience.  
 29 June, 1896. 6392. Have you, in your experience, had to do with patents and reports on patents? I have had a very extensive connection with patents. I report, on the average, upon over a hundred a year.  
 6393. For whom do you report? Principally for the Department of Justice.  
 6394. Have you examined the Letters Patent in the case of the Monier arch? It has never come before me officially, but I have just glanced at it.  
 6395. You have seen the specification? Yes, casually.  
 6396. Will you tell His Honor what is your opinion of that patent? I could not give you an opinion from a mere perusal of the documents. I may not have read it correctly. I have formed a certain general opinion of it, but I would not presume to quote that opinion in a case like the present without going into the matter thoroughly.

John Carter recalled and further examined :—

- J. Carter. 6397. Have you a private account at the Bank at North Sydney? Yes.  
 29 June, 1896. 6398. It has nothing whatever to do with your business? Nothing whatever.  
 6399. Did you produce all the receipts you had to the order of the Commission? All the receipts we had.  
 6400. I suppose there cannot be more than one fourth of what you should have? I could not form any estimate. I found more than I thought I had. I found some of them in an old shed. I hunted up all I could lay my hands on.  
 6401. Did you ever at any time keep these receipts filed up? At one time, certainly.  
 6402. Did you not keep them in periods—in periods of six months or for periods of a year, for instance? I have kept some perhaps for twelve months.  
 6403. Can you produce the statement for which you were asked by the Commission as to the merchants from whom you purchased cement? No. The only merchants from whom we have purchased to my recollection are Parbury and Henty.  
 6404. Have you purchased any from the firms of Gibbs, Bright, & Co., and from Austin? Yes; years ago.  
 6405. Were all the accounts for cement purchased paid for by cheque? Yes.  
 6406. The cement was not paid for in cash at any time? I do not remember any cash transaction. I cannot think of any reason why it should be so.  
 6407. *His Honor.*] Do you draw your cheques in the name of the payee or by numbers? In the name of the payee.  
 6408. *Mr. Parkes.*] Do you not keep a record of the material sent to each job? No.  
 6409. How do you know then in the end whether you have more or less material used than you anticipated? We keep no record of that sort.  
 6410. If you take up a job do you not estimate how much material you will want and how much labour will be required;—do you not go into your material in detail? No.  
 6411. You would trust to chance? No; but I should prefer that you asked these questions of Mr. Gummow.  
 6412. You do not know whether Mr. Gillan has an account in the Bank of New South Wales? I have no idea.  
 6413. Has he not one at the Bank of New Zealand? He very probably has; I think we have all been dealing with that bank, but I could not say definitely. I have no knowledge of Mr. Gillan's having an account there. If I ever knew it I have forgotten it. I know absolutely nothing about Mr. Gillan's private business.

Frank Moorhouse Gummow recalled and further examined :—

- F. M. Gummow. 6414. *Mr. Parkes.*] Do you separate your material from your labour in going on with a job—I mean in estimating what it is going to cost you? No.  
 29 June, 1896. 6415. You trust to chance as to how it will come out? There is no chance at all.  
 6416. Why? Because the contract is a schedule rate contract. We take out our quantities, and then we make an estimate of what the quantities are likely to be. They may be increased or decreased 20, 50, or 100, per cent.  
 6417. There is no real finality in the case of Government contracts then? Not in tendering.  
 6418. You cannot tell what it is actually going to run out at;—if it started at £20,000 it might run out at £40,000? That could be done.  
 6419. There is no finality to it? No.  
 6420. Mr. Gillan was originally your partner before you joined Carter & Co.? Yes.  
 6421. Could you tell me whether the property at Dulwich Hill belonging to Mr. Gillan belonged to him absolutely or to the firm? What property do you refer to?  
 6422. I mean the property which Mr. Maddison, I think, said Mr. Gillan owned at Dulwich Hill? The firm have never had anything to do with it.  
 6423. It is entirely his own property? I think so.  
 6424. Do you know anything about Mr. Gillan's affairs or business movements? No.  
 6425. Do you know whether Mr. Hickson, junr., while here kept a banking account? I know that he did in Adelaide.  
 6426. At what bank did he keep it there? The Bank of Australasia.  
 6427. You do not know if he had an account here? I believe he had an account at the Bank of Australasia here, but I am not certain. I know that he had such an account at the Bank of Australasia in Adelaide because I often paid in cheques to his credit there, he being at the time out of Adelaide.  
 6428. Have you at any time in the working of your business had an overdraft at the Bank of New Zealand? Yes.  
 6429. Did you lodge any property securities against it? Not to my knowledge.

6430. I suppose the North Sydney property was not lodged against it? No.

6431. *Mr. Smith.*] You heard what Mr. Hickson, junr., said about the moneys received by him from the firm;—I suppose that statement was correct? Yes.

6432. Your firm has not paid him anything beyond the amounts to which he was entitled—beyond the amounts which they should have paid him? No.

F. M.  
Gummow.

29 June, 1896.

WEDNESDAY, 1 JULY, 1896.

Norman Selfe recalled and further examined:—

6433. *Mr. Parkes.*] You are a M.I.C.E. and have had considerable experience in patent matters? Yes, very considerable experience.

N. Selfe.

6434. You have examined the nature of the patent in the case of the Monier arch have you not? I do not know anything about the Monier arch, but I have examined Carter, Snodgrass, and Baltzer's patent. The name of "Monier" never came before me. (*Vide Appendix No. 18.*)

1 July, 1896.

6435. *His Honor.*] The word "Monier" does not occur in the patent itself? No.

6436. You have prepared a report? Yes. The patent was handed to me and I reported on its value as a patent.

6437. *His Honor.*] The report you have prepared expresses your opinion as a patent expert? Yes.

6438. It would be in effect your evidence as an expert? Yes.

6439. *Mr. Parkes.*] Will you oblige His Honor by reading it? Yes.

In accordance with your instructions, I have examined a patent No. 4,084 of 3rd November, 1892, issued to Messrs. J. Carter, D. G. Snodgrass, and W. Baltzer, and find,—

1. The patent title is, "Improvements in concrete and cement mortar building and other constructions and manufactures."

2. The patentees are not the original inventors, but claim under a communication from abroad.

3. The essence of the alleged invention consists of the use of a lattice or skeleton work of iron bars or rods imbedded in the concrete or cement of a structure, such bars being secured in their required relative position to one another by being tied at their intersections.

4. The general use of iron imbedded in concrete or cement for the purpose of adding strength and stability was known and practised by the introduction of beams, rods, bars, or hoop-iron, before the application for this patent; but the patent is confined to the use of such bars as in (3) crossing one another and tied at such crossing.

5. The word "binding" is used in the body of the specification to indicate the method of fastening at these intersections, but no such term is used in the claims.

6. In consequence of a report by the Examiner of Patents that the specification as originally submitted was anticipated by Letters Patent 3,147, the patentees, by their agent, voluntarily altered the wording of the claims. No. 3,147 is a case which shows in a more elaborate way than 4,084 a number of methods of embedding metal rods and bars in concrete, which the applicants admit knowledge of. They must, therefore, have fully considered the matter before they altered their specification and restricted their claims to the special arrangement of lattice bars tied at their intersections.

7. If it be assumed that there is no objection to the specification of 4,084 on the grounds of anticipation or prior user in its amended form as granted, and that it is a valid patent, still, as it secures to the holders nothing more than they claim, it is a patent of an extremely and exceptionally limited scope, because it is confined to the connection of the bars by being tied at their intersections. The word "bind" is not used in either the agent's letter or the claims, while the word "tied" occurs several times in the letter, and is the only one used in the claims.

8. The word "bind" is used in the body of the specification to describe the fastening of two bars together where they overlap when a continuous length is required from end to end of the structure; nothing is said of this in the claim, however. Again, the binding is described as being "of sufficient strength to hold the bars in position during the process of packing the concrete around them," but nothing is said in any part of the specification as to the nature of this binding; whether it is to be a metallic one made with wire, or a binding with a fibrous cord, string, or marlin, made of hemp, flax, cotton, &c.

9. The words "bind," "binder," or "binding," are applied in the arts to fastenings made with both wire (metal) or string (flax), as in the ordinary harvesting machines, but the word "tie" is used in a more restricted sense, and it is hardly possible to "tie" in the ordinary meaning of the word with wire.

10. A reference to the figures attached to the specification shows in Nos. 1, 2, and 3, the intersections of the crossing wires or bars secured by binding wires, with their ends twisted together; therefore, although nothing is said on the matter, it was possibly the intention of the patentees that the word "tie" should apply to a fastening or binding in which a wire is made to encircle the intersection of crossed bars and then have its two ends twisted together in the way indicated by the figures, as well as to an ordinary tie by means of string secured by hitches or knots.

11. If the patentees are given the full benefit of this double system of fastening the bars at their intersections—possibly implied though certainly not expressed—they are still limited to a separate tie or bind at each intersection, because the tie or bind in the figures clearly shows the ends of the binding wire; and the tie alone in the claim clearly implies a fastening which is complete in itself.

12. It therefore does not seem that any stretching of the meanings of terms can be made, which would imply that the claims of this patent cover any system of securing the intersections of the lattice bars by binding or lacing with a continuous wire, in such a way for instance as the crossed wires of sieves and riddles are secured to one another; neither does it cover any arrangement of bars either interlaced or interwoven, or any system of fastening the intersections of such bars by one of the many arrangements of clips or bolts which could be used for such purpose.

13. For the foregoing reasons, and particularly on account of the claims having been deliberately limited to a very definite method of fastening the crossed bars at their intersections, I am clearly of opinion that there are a great many other and equivalent methods of securing such intersections available which are outside the patent; and that a lattice or skeleton work of crossed bars can be built up to be bedded in concrete, and can be lashed, bolted, or clipped, at their intersections, without infringing the patent; and that such lashing or binding can be made of either wire or string, if it is not tied at the intersections.

14. Whether such alternative or equivalent fastening would be of equal value for the purposes of a lattice core for a concrete structure is more a question of engineering than one for a patent expert, and as such I did not understand was referred to me.

6440. *Mr. Parkes.*] Your opinion is then that the Government would have a right to use this lattice work in any form slightly altered as far as the connections are concerned; subject to that alteration, you think it could be used without infringing this patent in any construction of compo. or concrete? The question is one of opinion as to what would be under the patent or not under the patent. The question of fact is that of course any fastening not covered by a patent could be used by the Government or any one else.

6441. Such as bolts or rivets? Yes; anything of that sort.

6442. *His Honor.*] As to your previous experience of the use of anything like this system of iron and concrete;—have you any knowledge of it? No. I could not give any opinion upon engineering matters so far as that kind of thing is concerned. My experience in engineering has not lain with this particular branch of work.

6443. Your experience has lain principally in what? More in metal structures.

6444.

- N. Selfe. 6444. You have not gone into architectural matters? I have been connected more with wharf-building, marine engineering, and so on. I have not had much to do with the building of bridges and aqueducts.
- 1 July, 1896. 6445. You have had a good deal of experience of the effect of compo., cement, mortar, or fine concrete, or whatever it may be called, in relation to iron? A great deal.
6446. I mean in the inner skins of iron ships, for instance? Yes. I have had a good deal of experience in that way.
6447. What has been your experience of the laying of cement, mortar, or fine concrete upon clean plates—has it preserved them from oxidation? The whole point turns upon what you mean by clean plates. If the plates are blue, with fire on them, as it is called—that is, with a skin—the concrete will make a union which will stand violent shocks. I have known vessels come into dock after being on the rocks, and so on, in which cases, except in the immediate site of the collision or bumping, the cement had adhered very firmly. I have known concrete to be knocked off the iron after being there for fifteen years, and where the iron has been found to be as clean as on the day it has left the rolling mills, or on the day on which it was put into the ship; but if there happened to be any rust or incipient oxidation you cannot insure that close union. At the same time it must be observed that the union of cement to a plate is more difficult than the union of it to a bar which it surrounds. In that case it cannot get away. In the case of a plate there is nothing but the actual adhesion. In the case of the enclosure of pieces of iron, such as hoop-iron, which are used in various buildings, the iron is enclosed, and in that case close contact is not of such great importance as in the case of plates.
6448. In that case the grip would give adhesion? Well, the metal is enclosed. It cannot get away. Take the case of a plate on the inside of a ship, if the cement did not adhere closely the shocks to which ships are subject would knock it off. It is put into the bottom of ships to keep bilge-water from many intersections and crossings which could not be cleaned.
6449. And it is found that it does preserve the plates? Yes.
6450. As far as the plates are concerned, it is an important element that the plates should be absolutely free from even incipient oxidation? Yes.
6451. But as to bars enclosed in concrete, you cannot say whether that is so? The bars cannot get away. When the bars are enclosed in concrete it is not a question of adhesion at all, although a very close union will be formed.

James Connor sworn and examined:—

- J. Connor 6452. *Mr. Parkes.*] What are you by trade? I am a bricklayer.
- 1 July, 1896. 6453-4. You were employed for a certain number of years by Carter, Gummow, & Co.? Yes, for a good number of years.
6455. Do you remember for how many? No; I do not know the exact number of years.
6456. On what particular contracts were you employed? I do not know the numbers of the contracts, but I can identify them by the names of the principal streets; I know that I was employed in Victoria-street, and also at North Shore. The contract at North Shore is, I think, No. 79.
6457. Were you employed upon 79A? No; but I was employed at Marrickville.
6458. Were you not upon 79A? No, presuming that 79A is the one which extends to Milson's Point. I was on the first contract on that line, but I was not on the second contract, which I know nothing whatever about.
6459. *His Honor.*] Did you not do any work at all on the south side of the intersection of Mount-street and Alfred-street? No; I was working on the other side, from the outfall to Mount-street—upon the large job.
6460. *Mr. Parkes.*] Were you on the Glebe contract? No; when that was going on I was working for Gummow, Gillan, & Co. at Camperdown.
6461. You do not mean the Annandale contract? No; I mean the Camperdown contract. I do not know the number of the contract, but it runs along to the Newtown railway bridge, and is intersected by the Prince Alfred Hospital sewer at Camperdown.
6462. Did you work at shafts Nos. 12, 13, and 14, at North Shore? There was a No. 12 on the contract. I was on, but no 13 and 14.
6463. No. 12 would be the last shaft at this end? Yes.
6464. Do you know a man named Dawson? Yes.
6465. Did you work with him? Yes.
6466. Have you heard through the newspapers or from any other source the nature of the evidence he gave? I have read every word of it as printed in the newspapers.
6467. Were you working with him when he left unpacked the drums to which he referred? No; the only time Dawson worked with me in the packing of drums was on the Camperdown job. In that case he did the labouring to my bricklaying.
6468. Who was doing the bricklaying work with Dawson upon Contract 79A? I was never there; I know nothing about it. I believe I worked there about half a day to finish a shaft. I think I remember being sent there from Marrickville to do that work, but that was my only connection with it.
6469. I believe that on several occasions Inspector Reid complained of your work upon Contract 79? Yes.
6470. What was the nature of the work of which he complained? I really do not know. I know that reports went into the Department the nature of which I never knew. I never knew anything about their contents until I read of the evidence given at this Commission.
6471. Did Reid not speak to you about bad work? No, not about bad work.
6472. Did he speak to you about the way in which you were doing your work? No.
6473. Reid never did that, you say? He never spoke to me about the brickwork at all. Any charges he made were made to the Chief Inspector.
6474. Were you not acting as a sort of foreman? Yes, I was foreman.
6475. Foreman of bricklayers? Of the bricklayers only.
6476. Not including the packing? All the packing in connection with the brickwork. Of the concrete work I know nothing.
6477. Did you ever observe any bad work going on upon Contract 79? No, nor on any other contract.

6478. You never saw bad work going on? No, and I am positive there is no bad work on that contract.
6479. You never saw concrete going into the work defective, as regards the proper quantity of cement? Never; although as a rule I should not see the concrete mixed. J. Connor.  
1 July, 1896.
6480. Reid has sworn that he saw you, the foreman bricklayer, and Dawson putting dry stones down a shaft and that he complained? That is true.
6481. He says he stopped you and told you to mix the proper materials? Yes. There is something in that.
6482. That was true? What I mean is that he made a complaint.
6483. Did he not speak to you about bad work? Well, he made a charge that we were doing it.
6484. He told you that you were doing bad work then? He said that we were shovelling down dry stone.
6485. He did therefore question you about bad work? Yes. When you spoke of bad work I thought you meant in connection with the brickwork.
6486. But you were acting as general foreman upon Contract 79, were you not? Yes. I looked after all the brickwork and the packing in connection with it.
6487. Did you ever say with reference to Reid, "Take no notice of him; he is only a damned buck navy"? Never.
6488. You never used those words? No.
6489. Did you make any remark to that effect? No, nothing to that effect.
6490. What did you say? I was working down No. 9 shaft. There was a labourer with me named William Hutchinson. I set out for the shaft, and at 1 o'clock we came up to No. 6 shaft both together. Hutchinson came with me, so that if assistance were required he could give a hand. When we came to No. 6 shaft Dawson said he required another half-gauge. I said, "Hutchinson, you had better give him a hand and put down the material." Henderson, a bricklayer, was also giving them a hand, so that they might get away home earlier. They then started to mix up the gauge of concrete. Hutchinson took up a fork and started shovelling the stones where they were broken. Henderson took a shovel which was on the board to shovel on the stones from where they had been thrown after they had been broken. Reid, speaking to him, said, "You will have to take a fork." Henderson said that the metal had been forked. Reid said, "The specifications say it must be forked." Henderson repeated that that had already been done, and he said, "What more do you want." Then they barneyed away, and finally Reid appealed to me. I was standing at the side of the shaft, and he asked me if I would stop him. I said that I would not. I said I did not see any harm in what the man was doing. He was simply shovelling on stones, which, so far as I knew, no man I had ever worked under would object to.
6491. You say you did not see the concrete being mixed. No. As a rule I did not see the concrete being mixed.
6492. You did not see all the concrete mixed on Contract 79? I should have to be at every shaft.
6493. What shaft were you at? I went to wherever men were working.
6494. But you did not see the concrete mixed throughout the job? Not all the concrete. If I happened to come forward when they were mixing the concrete I would see them. As a rule I work with the trowel in the drive continually, and as the man who mixed the concrete would be on the top, I never saw it done at all,—that is, on contracts generally; but I did see the mixing sometimes upon Contract 79.
6495. Do you know the bricklayer who worked upon Contract 79A? No.
6496. You swear that you never saw any defective work on 79 at all? I never saw defective work on any job I was on. I can safely say that it was never done on any job I worked on.
6497. *His Honor.*] You did not explain the first question as to the dry stones going down for the packing of No. 6 shaft? That evening there were, I think, either four or five batches of concrete put down to level up the brickwork. Dawson came to the shaft and asked me to pull him up, which I did with the engine. I said, "What do you want?" He said, "I want another quarter-gauge." I said, "Are you sure you do not require half a gauge?" He said, "No." "Then," I said, "a couple of barrow-loads will do, and if that is so, you had better start shovelling it forward, and I will give you a hand." I could not give him a quarter-gauge, as we had no gauge for a quarter. A 16-foot box would make a full gauge. Then there is an 8-foot box for sand, and a 2-foot box for cement. Knowing that I had not a gauge-box to make a quarter-gauge, and seeing that I could not make 5, 2, and 1, I said, "There is no help for it. We must guess it." There was some of a gauging of compo. lying alongside the shaft. There was one small bucket—at least, so Dawson told me at the time. I said, "You had better use it. I do not like to see it left; use it. It can be put down with the metal, and it will surely make it as good as it ought to be."
6498. Did Reid turn up while this was being done? Yes. The distance from where the stone was from the shaft would be about the length of this room. We had to start shovelling the compo. on to the stone, and mixing it up to throw it down. When we were shovelling the stone down towards the shaft to mix with the compo. he accused us of throwing dry stones down. I said, "We are not throwing dry stones down—we are mixing. If you like I will let you down the shaft, and if there are any dry stones there I will give £5 to any hospital you name." He said, "I do not want to go down the shaft. I am perfectly satisfied." I said, "I am not satisfied that a man should make charges which are false." He said, "I do not care about that." There were two men standing on the other side of the road, and I said, "Will you accept the evidence of these men if I bring them forward?" He answered, "I am perfectly satisfied." I said, "Then I shall have to be satisfied. You must make your accusation." That is all that happened. As a rule, if the work would not take the half-gauge we did not put in any at all, but let it stand over until the following shift. I remember going down No. 7 shaft with Mr. Boys, the engineer. We found that the labourer in the preceding shift had not packed up full. He could have put in another half-gauge. Mr. Boys said, "I do not like this. Will you look into this matter, and see that the brickwork is levelled up in each shaft?" I said I would. That was the cause of the quarter-gauge being used at all. I had given my word of honor to Mr. Boys to see that the work was levelled up, and I had it done.
6499. *Mr. Smith.*] Do you know a man named Crawshaw? Yes; he is a bricklayer.
6500. Did you ever work with him? Yes; he was working on Contract 79 too.
6501. Was he working on 79A also? I believe so; I have heard from outside sources that he was there. Personally. I cannot say, because I was not there myself; but I believe he was bricklaying there.
6502. As to Dawson, did you ever hear him threaten the contractors in any way? Yes.

- J. Connor.  
1 July, 1896
6503. What did he say? I was working on the telephone tunnel in Pitt-street, and he was working on 79 A. I believe he was working with a man named Crawshaw, from what he told me. He said to me, "Do you know what we did yesterday?" I said, "No." He said, "We did fourteen drums yesterday." I said, "You could neither have built them nor packed them." He said, "We did five, and we never put a shovelful of concrete into the packing." He also said, "It is all marked, and if Gummow does not give me a job at Annandale I will go to Varney Parkes, whoever he may be."
6504. When was this? This was about three weeks or a month before Christmas.
6505. Where is Crawshaw now;—have you seen him? I believe he met with an accident at North Shore. I never saw him. I have never seen Dawson since about a fortnight, or perhaps three weeks, after the New Year. When I saw him then he was borrowing ten shillings.
6506. *Mr. Gummow.*] While you were working upon 79, or upon any other of our contracts, did you always have plenty of material to hand with which to do the work? There was abundance of material, and we had a roving commission to use it in any way in the interests of the work.
6507. Was any restriction put upon you in the doing of your work? No restriction at all; the very opposite.
6508. You have worked under a good many inspectors? Yes; nearly every inspector in the Sewerage Construction Branch.
6509. Did you find them all the same class of men to deal with? Personally, I never had any trouble with any of them but Reid. I never was laying bricks in any work which Reid had anything to do with. There, a lot of men were employed, and I never laid a brick at all for a long time. I had to go from shaft to shaft where they were putting in pipes, landings, and ladders, and where there was a lot of work which had to be constantly looked after. In other contracts, I worked with a trowel just the same as any other bricklayer. My foremanship was confined to keeping the time and seeing that the levels were properly given before the men started, but on Contract 79 there was a lot of extra work to do.
6510. As to Reid, what sort of man did you find him to deal with as an inspector? In my opinion, he is a vicious, unprincipled, scoundrel.
6511. How came you to form that opinion? I formed it from the amount of annoyance and disturbance which he caused upon the job with every man on it.
6512. Was there more of that kind of thing than you had seen on any other job? I never had any trouble upon any other job under the Sewerage Construction Branch, and I have been 13 or 14 years on them. During the whole of that time I never had a word with an engineer or inspector.
6513. You gave satisfaction to the engineers and inspectors? I presume so. They never said anything to me.
6514. You have worked under other contractors besides those of our firm? Yes; under Rowe and Smith, Dalgetty, Rochester, Parry and Farley, and Pritchard.
6515. You never had any trouble upon those contracts such as you had upon Contract 79 under Reid? I never had anything at all in the way of trouble upon the other contracts, but on No. 79 it was simply horrible.
6516. Upon the other contracts did the inspectors see that the work was done properly, or did they let you do as you liked? They looked after their business in a proper manner.
6517. Do you know whether Reid came directly to the boards or whether he used other means to try to detect bad work? I heard that he used to slink along, but I never took the trouble to observe whether he did so or not. I heard that he used to post himself behind the trees on the side of the road, but I do not know whether that is so or not.
6518. But you heard that he did so? Yes; I may state one of the reasons why I came to form the opinion I have of Reid's character. I think it was the first night when he came on when he went down a shaft where a bricklayer named Phillips and a labourer named Gannon were working at one end. He remained there the whole night without leaving for a moment to see what was being done at the other end at all. He actually sat on the board, which would be about 4 x 3, and there he remained, the labourer having to put all the stuff, compo. and bricks, past him. If he had acted as any other inspector would act he would have gone to the other end occasionally to see what was being done, because while the bricklayer was laying his bricks there was no need for him to be there. There is no need to watch a man doing 4½-in. brickwork, because when the work is done you can easily see how it has been done. He seemed to want to catch the men like a policeman. That was continually going on during his inspectorship. He was a sort of detective, looking for promotion according to the number of cases he got.
6519. *His Honor.*] I suppose that when that little row took place about the forking you did say something to Reid which was not complimentary? Yes; when he got on to me to stop the man from doing what he was doing. I can assure you, from my knowledge of engineers and inspectors, that no man could have said that the metal the man was shovelling was not of the very best material. It was not only forked metal, but it was the tailings of forked metal.
6520. What did you say to Reid? He appealed to me, as I say, to stop the man from using a shovel, and when he put my monkey up I said, "The real fact is this, Reid, you have never been anything else but a buck navvy all your life, and now that you have been pitchforked into a position of trust you imagine you have a perfect right to browbeat every man you come into contact with." Those are the simple facts of the case.

Robert Rowan Purdon Hickson recalled and further examined:—

- R. R. P.  
Hickson.  
1 July, 1896.
6521. *Mr. Parkes.*] What inquiries did you make as to the positions of Mr. Forrest and Mr. Gillan before you accepted them as sureties in the case of Contract 77? The conclusion I arrived at was formed after a conversation I had some months before with one of the officials of the Bank of New Zealand.
6522. Who was that? Mr. Kane, the manager of the Bank of New Zealand in Adelaide.
6523. Is he an officer of the Bank now? I think so.
6524. Was he an officer of the Bank in March, 1895? He was an officer in 1894, and, as far as I know, he is an officer now.
6525. On what date did you see him? I have seen him several times.
6526. On what date did you make inquiry of him as to the position of Mr. Forrest and Mr. Gillan? The conversation I had with him was as to the firm generally, and it took place, as far as I can remember, at the end of 1893.

R. R. P.  
Hickson.

1 July, 1896.

6527. What position do you say Mr. Kane occupied then? He was the manager of the Bank of New Zealand in Adelaide.
6528. When you accepted Mr. Gillan and Mr. Forrest as sureties did you know they had an interest in the firm? I knew that they had not an interest in that particular contract. [*Vide Appendix No. 28.*]
6529. Did you know that they had had an interest in the contracts of the firm generally? I knew that their names had appeared in connection with other contracts.
6530. Where is Mr. Kane now? He is in Adelaide, as far as I know.
6531. Is he manager of the Bank there at the present time? I cannot say. I have not been to Adelaide for over two years. I remember that he spoke in the very highest terms of all the members of this firm.
6532. Before Mr. Forrest or Mr. Gillan signed the bond did you see them? I do not think I ever spoke to Mr. Forrest or Mr. Gillan in the office in my life. I think I have spoken to Mr. Forrest once and to Mr. Gillan once.
6533. You knew that they had been connected with this firm of contractors, did you not? Yes.
6534. Did you ever have any business communication with either Mr. Forrest or Mr. Gillan before March, 1895? I never had any communication with them at all.
6535. I mean any conversation or communication directly in connection with public business? No; never.
6536. Have they never had any interview with you of any description? I do not think they have ever done so in my office. I do not think they were ever in my office. Mr. Carter and Mr. Gummow were the only two members of the firm who interviewed me.
6537. Did you instruct Mr. Norrie to draw up the bond in this contract? I do not know whether the instructions came from me or from the Under Secretary, but Mr. Norrie must have received instructions from someone.
6538. Did you ever speak to Mr. Carter with reference to the position of his bondsmen? I do not think I did. I could not be certain.
6539. Did you ever speak to Mr. Gummow as to his bondsmen? No; Mr. Gummow was in Adelaide at the time.
6540. Did you ever speak to any other member of the firm about them? No.
6541. How did Mr. Carter submit the bondsmen to you;—was it done in writing? I could not tell you that from memory.
6542. What I want to know is, how you came to get the bondsmen submitted to you? It was done either in writing or verbally. The papers will probably show it. I presume it was done in writing. It is nearly always done in writing.
6543. Could you produce the letter? If such a thing exists.
6544. It ought to be in existence, ought it not? If there was a letter; but I am not sure whether there was a letter or an interview. There is nearly always a letter in these cases, so I suppose there would be one in existence somewhere.
6545. Do you remember where your conversation took place with Mr. Kane? I know Mr. Kane pretty well, and I have had various conversations with him. The conversation I specially refer to took place, I think, on the Adelaide railway station.
6546. Do you know how it came about? We were talking about the firm generally, and as an official of the bank, he spoke in the highest terms of the firm; in fact the expression he used, as far as I can remember, was that he would trust any one of the firm to any extent, and that they were all well-to-do persons.
6547. He was then speaking of the firm in Adelaide, was he not? He was speaking of the firm generally. Mr. Gillan was in Adelaide at the time.
6548. Who were the members of the firm whom you knew to be there? Mr. Gillan and Mr. Gummow were the two who were in Adelaide then.
6549. Mr. Forrest, I understand you to say, was spoken of too? Yes;—he was not in Adelaide.
6550. But he was a member of the firm then? Yes, upon some of the contracts.
6551. [*His Honor.*] What gave rise to the conversation you had with Mr. Kane as to the firm;—what led to their names being mentioned? I think it arose in this way: He knew my son was then in Adelaide, and he said it was a very good firm for a young fellow to be with. In the course of our conversation he spoke about the members of the firm generally.
6552. You had known Mr. Kane before then? Yes, a long time.
6553. Did you meet him by accident on the railway station at Adelaide? I think he knew I was coming and came down to meet me.
6554. That was on your arrival? Yes; I saw him three or four times in Adelaide, I think.
6555. [*Mr. Smith.*] Has the opinion you have expressed in your minute as to these two men being financially sound been confirmed lately? Yes, abundantly confirmed.
6556. Could you specially refer to any way? First of all the bond was taken, and that confirmed my minute. But quite lately I had a communication from the Manager of the Bank here, and he said that if there were any question at all in connection with the matter if I would refer to him he would furnish particulars.
6557. You are referring to the Manager of the Bank of New Zealand? Yes, or to the sub-manager, I forget which. He said he would give any information necessary as to the stability of the firm. I think Mr. Gillan's name was specially mentioned.

John Carter recalled and further examined:—

6558. [*Mr. Parkes.*] Did you ever for any of your jobs—say the Annandale job—buy Cullen Bullen lime? Not for the Annandale job.
6559. But you did buy it for one job? Yes, I believe in connection with the Woolloomooloo job six years ago.
6560. Was it condemned? I believe some of it was.
6561. Was any of that same Cullen Bullen lime which was condemned used on the Annandale job? No. I have had no dealings in Cullen Bullen lime for five or six years, speaking from memory—certainly not for a long period.
6562. You say some of it was condemned on the Woolloomooloo job—you do not remember the date? No, I do not.

J. Carter.

1 July, 1896.

Cecil West Darley re-called and further examined :—

- C. W. Darley. 6563. *Mr. Parkes.*] Before you reported to Mr. Young that Mr. Forrest and Mr. Gillan were good securities for carrying out Contract 77, did you make any inquiries? I made the usual inquiries. [*Vide* 1 July, 1896. *Appendix No. 26.*]
6564. From whom? I think I got my accountant, as I usually do in such cases, to make some inquiry of the Bank. We have always found inquiries in these matters a most difficult and objectionable thing so far as the Department is concerned. All that we can do is to go to our Bank manager and privately get some information from him as to whether the bondsmen are men of good substance or not. My accountant generally makes that inquiry.
6565. Who would that be? Mr. Conley.
6566. Is he in your Department now? Yes. He either went himself or, I presume, sent his right-hand man to make some inquiries for me.
6567. Did you know that Mr. Forrest and Mr. Gillan were contractors under the firm of Carter, Gummow, & Co.? No, I did not. Their names never occurred to me. I never knew until lately that Mr. Forrest had been in the firm. I had never heard of it.
6568. You did not make inquiry in this matter yourself? I have no time to make inquiry into such matters. I never do so.
6569. Did your accountant make inquiry as to whether Mr. Gillan and Mr. Forrest were connected with the firm of Carter, Gummow, & Co.? It never occurred to me to question him at all. The names were mentioned of course, but that practice has now ceased. We do not at present take sureties. It was always an objectionable practice. I always objected to it. We generally made inquiry of the Bank managers. If they reported to us that the men were perfectly useless, of course we did not accept them. I very often refused sureties on such information. As long as I received intimation from the Bank manager that the sureties offered were fairly good men I raised no objection to them.
6570. In getting this information did you in this case rely at all upon Mr. Hickson? No.
6571. You never communicated with him at all on the subject? No.
6572. You got your information quite independently of him? What was done has quite escaped my memory now, but, as far as I can recollect, I acted as I always did in such cases. I presume I sent for my accountant and asked him to make inquiries as to whether the sureties offered were responsible men.
6573. Do you know whether the Bank of New Zealand reported them as being in possession of securities to the value of £12,000? I do not know what the manager of the Bank said as to that.
6574. Could Mr. Conley give us that information? It is very likely that he could.
6575. Is he in the building now? Yes.
6576. *Mr. Smith.*] I understand that when names were submitted as securities it was not the practice to enter upon a detailed inquiry as to the property of the individuals? Never.
6577. You made a general inquiry as to how they stood financially? Yes, my object was to discover whether they were responsible men.
6578. That was the usual practice followed in every case? Yes. It is quite possible that Mr. Conley might have given the Chief Clerk instructions to make the inquiry; but my general practice was to go to Mr. Conley. I could not say what I did in this particular case.
6579. *Mr. Gummow.*] When you are dealing with contractors, and sureties are called upon, does not the question of whether particular contractors you are dealing with have done work in a satisfactory manner beforehand weigh with you? It weighs in my mind more than do the sureties. I look to the contractors more than I do to the sureties.
6580. You say that the contractors you are dealing with have greater weight with you than have the names of the bondsmen? If I have had previous experience of the contractors I care very little as to who the sureties are. That has always been my practice.
6581. Had you any previous experience of the firm of Carter, Gummow, & Co.? I cannot say that I had ever met them before last year—that is before I took over the sewerage contracts; but I had had a very satisfactory experience of yourself. I remember Gummow & Co. carrying out a contract at Potts' Hill; and I never had a contract carried out—I have said it repeatedly before—with more satisfaction by contractors who were working under most difficult circumstances. It was a contract that could not be paying from the cheap rate at which it was taken up. The ground turned out to be extremely hard rock where no rock was anticipated. The contract was carried out in a most satisfactory manner, and the Department was given absolutely no trouble whatever. Having had that previous experience of yourself, I had no hesitation whatever in allowing another contract to fall into your hands.
6582. *His Honor.*] That would be excavation work in connection with the Potts' Hill reservoir? Yes; I may also mention another circumstance. The South Australian Government wrote to me saying that Mr. Gummow had tendered, and in replying to it I told them my experience of him as a contractor. They wrote back to say that they had no hesitation in taking him as a contractor upon my report of him. I speak of men as I find them.
6583. This was a peculiar case—this security given for the permanence of the Monier work. I suppose that, under the circumstances, you would look into the question of sureties more particularly than in any other case? I was dealing with cases of sureties almost daily, and I cannot exactly remember the report. I remember that the substance of the report was that I thought the sureties might be accepted. I must have received a favourable answer as to the substantiality of the men before making the report.
6584. That is the first time you ever had to take sureties for the work in that way? I cannot call to mind a previous case of the kind, or rather a case exactly parallel. I do not think we had a parallel case. We take security for permanence of the work in the case of a reservoir. In that case the contractor has to be responsible when the water is turned on. When we have not been ready to turn the water on, we have taken securities from the contractors in order that they might be paid off, to secure any defective work being afterwards made good, but I do not remember a parallel case to that of Contract 77.
6585. Therefore, I suppose you would be very far from looking on these sureties as a mere matter of form? I certainly made inquiry in the usual way, and I must have received a favourable reply.

William

William Owen sworn and examined:—

W. Owen.  
I July, 1896.

6586. *Mr. Parkes.*] What is your calling? I am a miner.
6587. You have worked for Carter, Gummow, & Co.? Yes.
6588. Did you work for them on Contract 79, at North Sydney? Yes, on the big job.
6589. In connection with that contract, did not the miners communicate with the Department in consequence of the bad air in which they had to work? They sent word to the Department about the air being bad, and got no answer.
6590. Will you tell His Honor how long you worked under those bad conditions? We worked there for months. The air was so bad that we were sick pretty well every night when we got out of it.
6591. Was any air pumped to you? No.
6592. For how long were you working under those conditions? I suppose I worked at that shaft for about three months. That would be No. 10.
6593. *His Honor.*] That is in the hollow of Neutral Bay, is it not? Yes.
6594. *Mr. Parkes.*] For how long were you working in that district? About five or six months altogether.
6595. Do you remember the miners upon Contract 79 getting the secretary of the Miners' Association to write to the Department on the subject of the bad air? Yes; I was the one who asked him to do so.
6596. Is Lynch dead? Yes; he died on the Village Settlement.
6597. How many men out of those who worked upon the contract survived? I don't know. I know that most of them died.
6598. Did three-fourths of them die? I could not tell you that exactly, but I know that a great number died.
6599. How many were working there? There were four working at each shaft.
6600. The high death-rate did not result from disease following upon the dust from guttering and gadding in that case? No; it was from the want of air.
6601. Supposing proper air had been pumped to the head of the shaft, would it have mattered whether the work was blasting or guttering and gadding? It does not make much difference so long as you get proper air. In this case we did not get enough air to drive the fumes of the powder out.
6602. Did not Lynch complain of the fumes of the powder? Yes. There was not enough air coming in to drive the fumes out.
6603. How did you do your work? We had to go down into the smoke, and stop there until the smoke cleared a bit. There was not sufficient air in the drive, as I have said, to drive it out. Sometimes the candles would hardly burn, and if you put them down 20 feet away you would not be able to see the light.
6604. You say that you appealed to the Department? Yes, through Lynch. He sent a letter to the Department, from which he received no answer.
6605. Did you ever make any further appeal? I asked Reid many times to put a fan on with a boy to turn it, and he said, "There are plenty of more b—— men to be got."
6606. Is it not one of the conditions of the contract that good air should be supplied to the men? I suppose it is. We did not get it, and that is all I know.
6607. You swear positively that you did not get it? I did not. I had to leave the job on account of the want of air.
6608. Did you appeal to the Inspectors? No. We never spoke to them.
6609. But you appealed to the head of the Department? Yes, through the letter that Lynch wrote.
6610. How were you paid on that work? It was piece work; before we struck, the average wage came out at 5s. 2d. a day.
6611. What was your contract? I got £2 12s. 6d. for No. 12 and £2 12s. 6d. for No. 10. That would be the running yard.
6612. Not a yard cube? No. The running yard was what we got paid for.
6613. *His Honor.*] Were you guttering and gadding or blasting? Blasting.
6614. You had no guttering and gadding work? No.
6615. *Mr. Parkes.*] What would be the dimensions of the place you would blast out upon Contract 79? We were supposed to drive 3 x 4.
6616. What would be driven on the average? Sometimes 6 inches bigger and sometimes a foot bigger. It would depend upon the holes.
6617. Would it average above a foot bigger? No.
6618. Would it average 6 inches bigger? I could not tell. There would be a big hole here and there.
6619. You say that you were paid £2 12s. 6d. a running yard and for that work the contractors got 78s. per cubic yard? I do not know what they got.
6620. Had you to supply your own powder? Yes.
6621. Had you to pay for your own horse? We had to find a horse.
6622. Did your contract require that you should send the material to the top? Yes. We had to do that.
6623. In the schedule the item "excavation in hard rock, where a 4-inch charge of powder is used," is put down at 78s. per cubic yard? Yes.
6624. And the running yard would be about 4 x 3? Yes.
6625. I suppose the excavation would be 5 x 4? I could not tell what the average would be; in some places it would be 6 inches bigger; in other places a foot bigger.
6626. Would it be fair to take the average at 5 x 4? No; I suppose it would be about 3 x 4 ft. 6 in. We were supposed to drive 3 x 4; but there were big holes here and there.
6627. *His Honor.*] Were you paid for the quantity you were supposed to take out or for the quantity you actually took out? We were paid £2 12s. 6d. per running yard; it would not matter how much bigger it was.
6628. *Mr. Parkes.*] The contractors being paid by the cubic yard would receive payment for about 2 yards, whereas you received payment for only one? I do not know what they got.
6629. In no case were you paid more than £2 12s. 6d. per running yard in the case of No. 10? No.
6630. The miners have no special objection to guttering and gadding work? Not as long as they get plenty of air; it is the want of good air that kills them.
6631. In carrying out guttering and gadding work you can work to a greater extent—that is to say, you can work three shifts? We can work three shifts when we are gadding it out, but not when we are blasting it out, because they will not let us fire after 10 o'clock at night.

- W. Owen. 6632. The work can be done almost as expeditiously by guttering and gadding as by blasting? Yes, just about the same.
- 1 July, 1896. 6633. Did not Carter, Gummow, and Co. once send a petition to the Government? They started a petition when I was on the job about the chopping out. They were going to stop the blasting as some people were complaining, and they started a petition.
6634. Did you sign it? No, I did not.
6635. Do you know whether any of the men signed it? It came round to the shaft, so one of the men told me, but I never saw it.
6636. It was to get the Government to continue the blasting? Yes; to make them continue the blasting.
6637. What do you think of the conduct of the contractors in not giving you sufficient air;—was it an act of goodness on their part or otherwise? According to the men who have already died, I think they ought to be taken up for manslaughter.
6638. You think the contractors were guilty of negligence of human life? I do.
6639. In not providing sufficient air for you to work in? Yes.
6640. You have no ill-feeling to Messrs. Carter, Gummow, and Co.? No; they are as good men as you can work for. They are as good as any of the other contractors.
6641. Did you do this blasting work by piece-work? Pretty nearly all of it. All the daywork at blasting was done on the Marrickville job.
6642. Did they call for tenders? We generally took the job from the contractors at a price.
6643. You say that before you struck you earned on the average 5s. 2d. a day? Yes. In the shaft I was on we made about 10s. a day. Lynch took all the paysheets and reckoned it up, and it came to 5s. 2d. a shift on the whole job for all hands.
6644. Did you ever earn or hear of anyone earning as much as 15s.? Yes; I was earning good money under them then.
6645. Would you make 15s. a day when you were getting £2 12s. 6d. per running yard? At No. 10 we used to make from 10s. to 12s. a day.
6646. And you were paid £2 12s. 6d. per running yard? Yes.
6647. *Mr. Gummow.*] When you were doing this driving were any air-pipes supplied by the contractors? There used to be fans at some of the shafts, but boys were never put on to turn them.
6648. If you were earning 12s. a day, would it not have paid you for the sake of your health, and even your life, to put on a boy at 2s. 6d. a day to turn the fan for the shift? No; because the man working at one end of the drive, perhaps, would not pay, and I could not afford to pay the whole amount myself.
6649. You say you got £2 12s. 6d. per running yard? Yes, after the strike.
6650. What were you supposed to do for that money? We were supposed to drive the running yard.
6651. Were you supposed to find tools? Not drills; but we were supposed to bring the muck to the surface and pay for the horse.
6652. As to the paying for the use of the horse, did you pay for the whole of the use of the horse at the shaft? No; I paid my share the same as the other men.
6653. Did the man at the other shaft pay his share? Yes.
6654. If he were willing to pay his share of the horse hire, do you not think he would be likely to pay as much for getting good air? No; and there were no pipes at No. 10.
6655. Were there no pipes? No. I asked Jack Reid for them scores of times and could not get them.
6656. How much driving did you do on that contract? I drove in No. 10 shaft for three months.
6657. How much did you drive? Twenty feet a fortnight; sometimes more, and sometimes a little less.
6658. Used you to pay for the blacksmith sharpening your tools? No.
6659. Did you pay for your rails and trucks? No; we were supplied with those.
6660. Do you consider that you could have driven more if you had had good air? Yes.
6661. Do you think it was to the contractors' interests to give you good air? I do not know about that. They did not give it.
6662. When you went to the contractors you were in want of a job, were you not? Yes.
6663. Did they make you put in a price against the other men? Well, we took the job off the contractors.
6664. But how did you get it? We went to the office and asked for a shaft, and they would say, "You can have the shaft for so much a yard."
6665. But the contractors did not call for tenders and make you compete against your fellow-workmen? No. They gave us a price, and if we did not like it we could lump it.
6666. And at the price given you, you could earn from 10s. to 12s. a day? We did that at No. 10.
6667. Were you specially good men? We were just about the same as any other men, I suppose.
6668. Did you ever know of any men loafing on the contractors down below? If they loafed at all they loafed on themselves.
6669. You have known them to loaf? I do not know of it.
6670. Concerning the other shaft on the contract—do you know whether the men there got air at all? The engine shafts were all right. Those were the only shafts on the job that I know of which did get air.
6671. Do you know how many engines were at work? There were six or seven, I think. The shafts which had engines were Nos. 8, 7, 6, 5, 4, 3, and 2.
6672. *Mr. Parkes.*] Were the pipes properly connected in any of these cases? No; they would not do it.
6673. Were the shafts from No. 2 to No. 8 all engine shafts? Yes.
6674. Did they get sufficient air in those shafts? Yes; it was pretty good there, so I have heard the men say.
6675. The men in those shafts were satisfied? Yes.
6676. But not in yours? Not in the rest of them.
6677. Did you work in both shafts and drives? I did not sink the shaft.
6678. You were working only in the drives? Yes.
6679. Do you know what was paid to the men working in the shafts? Fifteen shillings when they started and more when they got deep. When they got down to a good depth 17s. 6d. was paid, and it rose afterwards.
6680. Did they ever get over £1 in the shafts? I do not know what they got, but I do not think so.
3681. *Mr. Gummow.*] As to the pipes, who was supposed to put the pipes in? The contractors.

6682. Are you sure of that? I am sure you are supposed to supply us with air as would have to be done in the case of any other mining.

6683. You say you got £2 12s. 6d. per yard;—do you know what that was supposed to be for? It was only for the driving, pulling up the muck, and landing it on the top.

6684. Did the contractors put in the rails for you? No.

6685. You did that? Yes.

6686. Don't you know that as a matter of fact the miners always put in the pipes? They do not—the contractors do it chiefly. Some of the men do it for their own sakes. As a rule a shift is generally allowed for putting in the pipes. In some cases they will do it, in other cases they will not. If they can break through from one end to the other they will not do it.

6687. Did you ever do guttering and gadding work? Yes; on Lemon and Spencer's contract, Woolloomooloo.

6688. How long were you working at guttering and gadding? About two months.

6689. You consider that there are no greater ill effects from guttering and gadding than from blasting if there be no air in either case? They are both about the same. If you get no air you cannot live. It is bound to affect your lungs.

6690. But if the air is good is there no difference? It makes no difference. If there is air it is just the same as mason's work on the surface.

6691. Do you know of any men who have died from the effects of guttering and gadding work? I do not know what they have died from, but I know that plenty of men who have worked on sewerage contracts have died.

6692. Have you ever heard what they have died from? Mostly from bad air, I think.

6693. You do not know whether they have died from dust in their lungs? I think not. The doctor told me that my working in bad air was the cause of my own sickness. He told me that I was not to work any more in bad air.

6694. Then as a matter of fact you do not know what the men died from? No, not absolutely.

6695. As to the cost of sinking the shafts, do you know whether any bonus was given in connection with the sinking of them? £50 is given for "blood money," as they call it in the shafts.

6696. What do you mean by blood money? It is given so that they may run one another to get the shafts down quickly.

6697. If they run one another who gets the benefit of it? Those who get down first.

6698. Do not the others? They get nothing at all. It is like horse-racing.

6699. If you did 10 feet in a shaft in a week would you get no more than if you did 5 feet? Of course you would receive money for 5 feet more. If you sunk 20 feet you would get money for 20 feet.

6700. Is that like horse-racing? There is something very much like horse-racing to get the £50. There is £50 for the men who get down the first 100 feet.

6701. What do the others get? Nothing but the price of the shaft.

6702. If they run a good race with the others do they not get anything? Well, they get the chance of getting in first just the same as a horse would have. If they do not get in first they simply get paid for what they sink.

6703. *His Honor.*] You mean that there is no second prize? I never heard of its being paid, and if it had been paid on the job I think it is likely I should have heard of it.

6704. *Mr. Parkes.*] Do you know a man named Tom Jones? Yes.

6705. What did he once tell you about one of these contracts? He told me that he had filled a sump-hole with a piano case.

6706. Is that on the Glebe job? Yes.

6707. Would that be paid for as concrete? I do not know, but I should think so.

6708. Did he tell you what shaft that was in? I do not remember now, but I know that it was on the Glebe job.

6709. *His Honor.*] Were there any pipes supplied for the shafts—that is to say, if anyone had chosen to lay them, were there pipes supplied for the purpose? In some cases, if you chose to carry them from the yard on your back.

6710. How far away would the yard be? It would be a good half-mile away from my shaft, No. 10.

6711. But there were pipes to be obtained at the yard? They were mostly at the yard; some were at the blacksmith's shop. That would be nearer to the shafts than the yard.

6712. What size are the pipes which are used to supply the air? They would be about 3 inches in diameter.

6713. They would be galvanised-iron, rolled and soldered, I suppose? Yes.

6714. Would they stand the pressure? Of course, if a hole were knocked in them the air would escape. They are ordinary galvanised-iron pipes.

6715. Were any fans supplied at the heads of the shaft? There were none at No. 10 while I was there. I had to leave on account of the bad air.

6716. Did the men ask the contractors for fans? I asked Jack Reid for them, and I know that other men, working at the other end, asked him. In the case of one man he was nearly dead from the bad air, and he had to go home to his friends at Adelong. He simply could not work any longer.

6717. *Mr. Gummow.*] What is that man's name? Big Bob I used to call him; I do not know his surname.

George Dawson recalled and further examined:—

6718. *Mr. Parkes.*] You were present when Mr. McCredie made an inspection of the work upon Contract 79A? Yes.

6719. Did he find all the holes which you say are there? The big hole has not been found yet. Mr. McCredie never went down the sewer in High-street. They never touched that, unless they went down there before I came, and I do not think that is very likely.

6720. Did you do work in High-street? A little. That is where Hansen did the bad work, and got discharged for doing it.

6721. Was not that inspected? Not by the experts.

6722. Did you ever do defective work on other contracts on which you worked some years ago for Carter and Co.? Yes. There are some other places that I know of. There is a sump at Camperdown which was filled with muck, shale, and cement casks up to about a foot from the top.

6723.

W. Owen.  
1 July, 1896.

G. Dawson.  
1 July, 1896.

- G. Dawson. 6723. Where does the Camperdown job run? Through the University Park and the hospital grounds down to Camperdown.
- 1 July, 1896. 6724. Did you work on the Glebe job? No.
6725. Did you work on the Annandale job? Yes.
6726. Was there any defective work done there? Casks which had been opened there were sent over to the shed to be filled with cement which I was told had been condemned. We were supposed to break them up, but when the heads were taken out we were ordered by the ganger, Vandeen, to take them to the shed, where they were filled up with cement from bags.
6727. Do you say the cement was in bags? Yes. It was taken from them and put into the casks.
6728. Where did it come from? It was Cullen Bullen cement, I think; I never noticed the brand.
6729. How did you know that it was condemned? I only know it from hearsay. The filling was done very quietly.
6730. Were there any labels on the casks that were filled? No. They got torn off when the heads were taken out. I helped to carry some of them to the shed to be filled. If they had any labels they would be just the same as those upon the casks we were opening.
6731. The cask generally had the label on the top? Yes. We put the heads of some of the casks back again.
6732. Were the labels intact in any case? No; scarcely ever. With so much handling they got torn off.
6733. How many casks did you fill in that way? Sometimes fourteen, and sometimes eight or nine a day. If the inspector came near us he would make us take up the axe and break the cask. It would depend upon the number of casks which were saved.
6734. Are you aware that Manager Read has sworn that all you said concerning his giving you instructions to do bad work was not true? I saw according to the papers that he had said so, and that he attributed the bad work to laziness. He often chaffed us and said, "You b——s, you do not know how to save cement; I worked four days on three-quarters of a cask at Duke-street, Woolloomooloo, when I was labouring." He would often make a brag of that kind.
6735. What have you to say concerning his denial? I still say positively that he did tell us on several occasions to do bad work. I remember his saying more than once that if we kept using as much cement as we were using we should run out of it and we should then be idle. He would often throw in our teeth that clever feat of his when he worked four days on three-quarters of a cask.
6736. Connors also has stated that he on no occasion saw defective work where you say defective work was done? If I remember rightly, I said that Connors always looked after us, and saw that we did the work fairly well. He has done defective work himself; that he cannot deny.
6737. Can you tell us the place? There is a place in Camperdown, when we were working on night-shift, and where, instead of putting in two rings he put in the toothings and left the rest out.
6738. For what distance? It was only a matter of one or two drums; it happened so long ago that I can't say what the distance was. I know where it is—that is, I know it is between two shafts. I might not be able to go within feet of it, but I know it is there. It was done while we were working on a night shift. I heard Connors say himself that if he had taken the interest in the Marrickville job that he had done formerly he would never have allowed the scamping to go on which his labourer was doing.
6739. Could you point out any of these places, such as the one you referred to at Camperdown. Take the two places,—the place where you say bad work was done, and the place where you say rubbish was put down a sump? I can go to the sump, and I can go between the two shafts where the ring was left out. It happened a good while ago, and I might not be able to go within a few feet of it at first; I know the drive, and I know pretty nearly where it is. The whole of the drive is supposed to be double-ring work.
6740. Did you ever hear anyone talk of defective work upon the Glebe job? Yes; it has been reported that a piano case was put down one sump there; but the man who told me so is dead, so that I could not pick out the shaft.
6741. Did you ever tell Connors that you intended to put the company away because of their bad treatment of you? No. I told Connors as I told others that it was time they were put away,—that they were asking us to do too much of that kind of work. I remember his saying himself that no man could do the length of brickwork which was reported to be done and pack it. He said, "No man could do the quantity of work you are doing at North Shore. We all know that it is not to be done. He also said, "It isn't a case of O'Neill's job. I always told the inspectors on O'Neill's job that they were not packing the work if they were doing that quantity. No man can lay more than 800 bricks a day at the outside, and they were laying 1,000 on O'Neill's job. If they were doing that quantity they were not packing it, they were not doing it properly." He told one of the inspectors that in front of Maddison and Henderson, two labourers, and myself in Emily-street.
6742. Were you working long on the Annandale job? Only on one part of it. I was on the concrete board.
6743. Were they putting in a sufficient quantity of cement there? The work was all pretty fairly done there.
6744. What was the nature of the stone? It was all sandstone from the crusher.
6745. Used they to use in the work the sandstone that came from the tunnel excavation? If the inspector allowed it to be used they used it. Some of it was used.
6746. Did they use it to any extent? I could not say. I was not at the crusher.
6747. *Mr. Smith.*] Was Connors working with you on 79A? Never on 79A.
6748. *Mr. Gummow.*] You say that on the Annandale contract some of the cement was recasked? Yes.
6749. Do you know what the cement, which was put into the casks, was taken out of? Bags.
6750. Are you sure of that? Yes; I was there when Cady started to fill one on a Saturday.
6751. Do you know whether the bags contained condemned cement? That is only hearsay. I was told it was condemned cement.
6752. Do you know whether any of the cement in the bags was used on the contract? I believe there was some of it used before I came there.
6753. You do not know of it yourself? I only heard that it was condemned cement.
6754. As to Reid's telling you that he had worked four days on three-quarters of a cask of cement, where was that? At Duke-street, Woolloomooloo, where he was working as labourer with Connors.

6755. Was he labourer there? I do not know myself, but it was common talk that both he and Connors did it. G. Dawson.
6756. When you were here on the first occasion, you said you went to see Mr. Parkes;—did you ever write to Mr. Parkes before that? No, never. 1 July, 1896.
6757. Did Mr. Parkes ever write to you before then? Never.
6758. Did you write to him afterwards? I have written to him since.
6759. Did he reply to you? Yes.
6760. Have you shown anyone that reply? I have shown one letter to the effect that I was wanted down here in connection with the Commission.
6761. But I mean Mr. Parkes' reply—did you ever show anyone that reply? No, certainly not.
6762. Do you know what the nature of the reply was? I cannot say now.
6763. You are sure you do not know? I am certain I do not; if I knew I would tell you.
6764. Did not Mr. Parkes in his reply write that you were the very man he wanted, or words to that effect? Never.
6765. Did you not show such a reply to someone on the Newtown Bridge? Never.
6766. Did you ever tell anyone at North Sydney that if the firm did not pay you for a full fortnight you would retaliate on them, or something to that effect? I never said a word about it. I did not want pay for work I had not done; I only wanted pay for work which I did.
6767. Did you ever say anything to anyone about a payment which you thought you ought to have received? No; I never said a word about it. I was always paid for my work.
6768. Did you ever say so to Booth, the carter? No, never.
6769. Where did you board at this time? At Marrickville.
6770. At whose house? At Hart's, the plumber's.
6771. Did you ever say to Hart that if the company did not keep you in employment you would make it d— hot for them? Never.
6772. Did you ever say that to Mrs. Hart? Not that I would make it d— hot for them.
6773. That you would make it hot for them, any way? I dare say I said I would do my best to do so.
6774. To do what? To put the job away when I knew that it required to be done.
6775. Did you ever say anything to a man named King? He may have been in the house at the time, but he was not in the company.
6776. Have you any of the letters Mr. Parkes wrote to you? No.
6777. You are sure you never showed any letter of Mr. Parkes' to any one? Never; I showed the summons, that is all.
6778. You did not show to any one a letter in which Mr. Parkes wrote to the effect that you were the very man he wanted? I am quite certain I never did.
6779. *Mr. Parkes.*] Were not all my letters to you written by my secretary? Yes.
6780. They were simply letters asking you to come in at a certain time as I wanted you? Yes.
6781. You never got a letter in my handwriting? No.
6782. You have had interviews with my secretary? Yes.
6783. Did I not tell you when you first came to me that this would be your ruin? You advised me not to have anything to do with it.
6784. I told you to go away and make up your mind thoroughly as to whether what you had told me was absolutely truthful, and as to whether you could stand the ill-feeling which your evidence would bring upon you? Yes.
6785. Is it not the case that you have been unable to get any work since? Yes.
6786. You have found that what I told you was quite true? Yes.
6787. *Mr. Gummow.*] Did you ever try to get upon the telephone tunnel work? Yes.
6788. Did you have a letter in your pocket from any one when you applied? Yes; I took a letter from Mr. Molesworth.
6789. Did Mr. Parkes give you a letter? Yes.
6790. Did Mr. Parkes ever give you an I.O.U. to pay for your rent? No; I do not know what it is.
6791. Did he ever give you an order? No, never. Mr. Parkes would not give a tram ticket.
6792. Did he give you an order to get employment? He gave me a letter so that I might try to get on to the telephone tunnel, but the manager said he would not take any political letter, and that if I had the whole Ministry at my back he would not take me on unless he wanted a man.
6793. *His Honor.*] What is this defective place in the work at North Sydney which you say was never found? It is one of the cavities I mentioned to your Honor.
6794. Did not Mr. McCreddie and Professor Warren open out the exact places you indicated? They found one place, but I was not quite right in my measurements for the other one.
6795. You say there is another cavity still to be found? Yes.
6796. Between shafts 12 and 13? Yes.
6797. Is that the one which you said was about 9 feet long? Yes, fully that.
6798. What do you say about the work in High-street? They never went into High-street. It runs off the main line from shaft 14 down towards the water.
6799. To the east? Yes.
6800. Do you say there is specially bad work in that length? Yes; that is the place from which Hansen was dismissed. There is also some scamping that I did. I remember the inspector saying that if the job was not so near being finished he would not allow them to use some of the stuff which was put in.
6801. What was the scamping that you did? There were some cavities which were not properly filled in as they ought to have been, and if there is anything over the brickwork it is very hard to find cavities.
6802. Is this work in an overflow tunnel which goes into the harbour? No, it is a branch for the houses. It runs into the main sewer.
6803. Can you point out exactly where the sump is which you say was filled with rubbish? Yes; I could go to the place.
6804. Can you fix it by the intersection of any street? No; it is in a paddock. It is at the bottom of one of the shafts.
6805. Do you know the number of it? No; but I can go to it.

FRIDAY, 3 JULY, 1896.

Robert Stewart Littlejohn sworn and examined:—

R. S.  
Littlejohn.  
3 July, 1896.

6806. *His Honor.*] What was the nature of your work at the time Mr. Baltzer was in the Department? I was employed there as a draftsman.
6807. In what branch? In the Sewerage Branch.
6808. Mr. Baltzer was also employed there up to the time he left the Service, I believe? Yes.
6809. Used you to sit next to him? Yes. I sat next to him the whole time that we were in this new building.
6810. Had you an opportunity to see upon what plans he was engaged at different times? I knew exactly what work he was doing always.
6811. I suppose you know the plans of the Monier aqueduct work which were sent in by Messrs. Carter, Gummow, & Co., with their tender for Contract No. 77? I saw the plans once. That was on the occasion of Mr. Baltzer bringing them to the office, when they were finished. He had told me that he was engaged upon some plans; and he used to take instruments home from the office every evening in order that he might work upon them. He said that Messrs. Carter, Gummow, & Co. were to submit them with their tender when they were finished. I only saw the plans once when they were finished, when he brought them and showed them to me. [*Vide Appendix C.*]
6812. Did he do any part of the work connected with the preparation of those plans during office hours or in the office? I never once saw him doing any work in connection with those plans in the office.
6813. Were there not some plans which he formerly prepared connected with the Monier work? Yes. A scheme was got out for Contract No. 112, going across Muddy Creek. They were for an open drain. Those plans were submitted in the proper way when they were finished, with the permission of Mr. Bagge, who knew all about it at the time. Those were the only Monier plans I ever saw done in the office.
6814. Were those done by Bagge's orders? I cannot tell you whether they were made by his orders, but he knew all about the matter. He knew that they were being done.
6815. They were the plans explanatory of No. 3 of the alternate scheme? Yes. Mr. Cutler got out one scheme, Mr. Baltzer got out another, and I also did some of the drawings in connection with that work. [*Vide Appendix B.*]
6816. I suppose you would recognise the plans again if you saw them? Yes.
6817. Do you recognise drawing No. 11, contract 77, the Monier plan, as a drawing done in your office? It is like the plan I saw there, but there ought to be some others.
6818. The heading would indicate that it is not one of the plans you were speaking of? Yes. It is not the plan I saw done in the office.
6819. Was it one of the plans which you at any time saw brought to the office? It might be one of those, but there should be two more drawings. I might have seen this particular drawing, but there seemed to be more detail work in the drawings I saw? I only saw them once.
6820. The question is, whether you think this plan was prepared in the office? I never saw that plan being done in the office.
6821. Can you say for certain that it was not drawn in the office? To the best of my belief it was not drawn in the office. I never saw it in the office to the best of my belief.
6822. Do you recognise the tracing accompanying the alternative schemes? Yes; I did that myself.
6823. From what was the tracing made? It was made from my original plan. I did not do the tracing itself.
6824. Are you sure you did the original plan of which this is the tracing? I believe I did.
6825. This is Monier work, is it not? Yes.
6826. And did you do the Monier for No. 2 alternative scheme? I made the original plan of this tracing.
6827. Which of the plans similar to this was it that Mr. Baltzer did in office hours? The original of the tracing to which I refer was done in office hours.
6828. By whom? By myself, under Mr. Baltzer's orders. He was my senior at that time; I generally got my work through him.
6829. So that he would be responsible for the plans? Naturally.
6830. He did not actually do it himself? He designed it, as it were; he worked it out.
6831. Do you know the second scheme dealt with in Mr. Bagge's report? Yes.
6832. As far as you know it was done at the same time? Yes; it was done at the same time as the tracing. I believe No. 2 was adopted in the case of No. 112, in preference to the No. 3 Monier scheme.
6833. How is it that one of these plans appears here in the form of a tracing? I cannot tell. I know that proper drawings were made—that this tracing was done from my drawings.
6834. Do you know who did the tracing? It would probably have been done by a man named Hollings.
6835. Was he one of the draftsmen in the office? Yes. The figures and the printing look like his.
6836. Have you any idea of what has become of the original? No.
6837. Did you not know why the tracing was made? Most of the drawings were traced in order that prints might be taken from them. We invariably traced all the drawings, and the originals were kept. The plans were used about the office for reference, and to hand to contractors.
6838. Why should there be the originals of the plans in two of the cases and the tracing only in the third case;—you cannot explain? No.
6839. *Mr. Parkes.*] Did Mr. Baltzer make any plans himself? Not latterly.
6840. I mean at the period at which these other plans were made? No; I never saw him making any of those drawings. He had draftsmen under him, and he gave them orders.
6841. Did you see any other draftsman making drawings similar to these at the same time that the other plans were made under Mr. Baltzer's orders? No. All the Monier work ever done in the office was done by myself—by his orders, of course.
6842. Did you make any other plans besides the one before us? No. That was the Monier drawing that was made for contract No. 112.
6843. Were there any others? No.
6844. You are sure there was only that one? Yes.
6845. There were not four drawings made—you are sure of that? No; I cannot remember four. There may

R. S.  
Littlejohn.  
3 July, 1896

may have been another drawing of some details, but the one to which I refer was the only one made in connection with this particular work.

6846. You spoke of seeing drawings with more details;—what drawings were they? They were the ones that were submitted. I was under the impression that the drawings which Mr. Baltzer did in connection with Contract No. 77—I mean the drawings which he did at home—had more details than were on the drawing shown me just now by His Honor.

6847. Can you tell me when the original drawing in the case of Contract No. 77 was made? It was done a good time ago. I have been in the Department five years. It was done under Mr. Hammer.

6848. In Mr. Bruce Smith's time? I do not know. I was not in Mr. Hammer's room at that time.

6849. Would it be three years ago? I could not say, but I should think more than that.

6850. Was it made before May, 1895? I cannot associate it with any particular date, but I should say it was made three years ago.

6851. When were the plans of Contract No. 112 made? They were made shortly after we came in to this building from Lincoln's Inn Chambers.

6852. At what time would that be? Somewhere about three years ago.

6853. Were the plans of No. 112 drawn after you had made out the Monier plans? There was some Monier work in 112.

6854. When were the plans of No. 112 made? On the 22nd February, 1895; at least, that is when they were finished or signed.

6855. The plans for contract No. 77 would have been made before that? The originals\* would, decidedly, I should think.

6856. Listen to this evidence by Mr. Hickson:—

1557. I understand that No. 2 scheme of Mr. Bagge's report had been worked upon then? No, it was worked upon as the result of the calculations then made.

1558. It had been worked upon before you wrote this minute? Yes.

1559. There was only an interval of six months? Immediately after Mr. Bagge's report had been presented the contract for No. 112 was got into hand on the basis of No. 2 scheme.

1560. And it was in the working out of the quantities that you came to certain results? Yes; the results are shown on plans No. 2 and No. 3, which I have put in.

1561. After arriving at these results the office drew the plans of No. 77? Yes.

1562. In drawing the plans of No. 77 were the plans under scheme No. 2 in Mr. Bagge's report borne in mind in any way? We bore in mind the result of our researches as to the cost of work upon No. 2 scheme.

1563. You had it in mind then that, as between No. 2 scheme in Mr. Bagge's report and No. 77, there was not much difference;—is that so? There was not very much. I have had the estimates all run out accurately since, and I can show you how they come out. (*Vide Appendices F and C.*)

6857. If the plans of No. 77—that is, the departmental plans—were drawn before the plans of No. 112, it would have been impossible to make that comparison, would it not? These are not the original plans of Contract No. 77. They were done a long time before that.

6858. Were they not only altered by the taking out of the stone piers and of some concrete? They are a different design altogether. I remember doing one of the series.

6859. *His Honor.*] As to the original plans of No. 77, were they simpler;—was the design a simple one? They were much more elaborate than these. The alteration was made to cheapen the design. I remember that a lot of ironwork was done away with.

6860. *Mr. Parkes.*] What is the date given on the drawing of No. 112, do you say? The 22nd February, 1895.

6861. Therefore, those drawings were made after the drawings of No. 77? They were signed afterwards, but they may not have been made afterwards.

6862. They were made at all events about the same time? Apparently.

6863. *His Honor.*] You were going through the history of Contract No. 77;—how long before the plans for the present No. 77 were drawn were the first plans in connection with No. 77 drawn? I cannot say how long exactly. I had nothing to do with the first scheme beyond seeing it after it was all finished.

6864. How long before you had anything to do with it would that be? I could not attempt to say. All that I know is that I saw the plans when they were finished. They were brought out to be referred to when we were getting out the new designs.

6865. What had you to do with No. 77? I made No. 6 of those drawings, and also one of the detail drawings.

6866. What was the relation which your drawings bore to the original No. 77 scheme? It was intended that the new drawing should supplant it as being a cheaper job.

6867. In what way was the original scheme in No. 77 simplified? I remember that a lot of expensive cast-iron hand-rails along the top were done away with. We got Mr. Bagge to consent to that. There is also a difference in the span of the arches.

6868. Do you mean that the spans were increased in the more recent plans? I think they were increased. It was in the small arches that you see at one end of the White-street aqueduct that the change was made.

6869. Is that the whole of the difference? It was a different construction altogether as far as I remember.

6870. It was cheaper? The change was made with a view to cheapen it, and I believe it did come out cheaper.

6871. *Mr. Parkes.*] Had you not stone and double-pressed bricks in the original design? I believe there was a good deal of stonework.

6872. There were stone cornices? I think the piers were stone.

6873. Were there not cornices? Yes.

6874. Was there any difference in the upper structure as between the original design for No. 77 and the later design? The later design is much simpler.

6875. Could the original plans for No. 77 be produced? Yes.

6876. *His Honor.*] As to the preparation of the Monier plan which was put in or sent in after the tenders for No. 77 were sent in—the plan which explains the lump sum tender of £15,500—what did you hear about that in the office? I understand that you refer to the plans which were sent in with Carter, Gummow, & Co.'s tender. Mr. Baltzer told me that he was going to prepare some plans for them to send in with their tender. He used to take home his instruments every day for that purpose and bring them back

\* NOTE (*on revision*):—By originals I mean the plans executed under Mr. Hammer.

R. S.  
Littlejohn.  
3 July, 1896.

back again in the morning. On one occasion, I remember that he forgot his instruments. Some time after that, I remember his bringing the plans in, and as he unrolled them I remember his saying "I have these plans to-day, so you can look at them." He then showed me the plans.

6877. How many sheets were there? Three sheets. When I was shown the Monier plan this morning I did not altogether remember it, because I recollected seeing three sheets. I do not know whether they were all to be submitted, probably not, because the details would not be required. I know a man who was living with him at the time, and who saw him at night working upon these plans.

6878. Who is that? Mr. Hungerford.

6879. Is he the gentleman who is now in the office? Yes, he is in one of the clerical branches.

6880. Is that Mr. E. Hungerford? Yes. He was living in the same house, and he used to see Mr. Baltzer working upon these plans at night.

6881. Do you know how it was that Mr. Baltzer came to introduce the idea of working out a Monier plan to be submitted with the tender for Contract No. 77? I have no idea at all.

6882. At any rate, it was understood some time beforehand, that such a scheme was going to be submitted by one of the contractors? He mentioned to me that he was going to make a drawing for that particular contract.

6883. Was that known to any of the heads of departments at that time? I do not think it was. As far as I know it was not.

6884. Was it mentioned to you confidentially, or how? Yes. We used to converse a good deal about the Monier work, because I liked it, and I had done more of that work than had anyone else; in fact, I was the only one who ever did any of the drawings. I suppose, therefore, that Mr. Baltzer, thinking I would be interested, mentioned it to me. My seat in the room was next to his, and he casually mentioned the circumstance.

6885. You are referring to the occasion when Mr. Bagge got out the three schemes mentioned when you say that you had had some experience of the system? Yes.

6886. That is the experience you allude to? Yes; but of course I knew about the thing before then.

6887. Before that? Yes. I knew about it privately.

6888. From reading, I suppose? Yes.

6889. Are you an engineer? Yes. I am an engineer, trained in Scotland.

6890. *Mr. Davis.*] Since you prepared the design for Mr. Bagge to submit in connection with Contract No. 112, the plans of the office have been moved about a great deal? A very great deal.

6891. So that it would not surprise you to find that the original of No. 3 scheme which was submitted by him has been mislaid? There have been a number of drawings mislaid.

6892. What are the drawings of Nos. 1 and 2 which have been laid upon the table—are they originals? No; they are heliographs.

6893. Would not those heliographs be made from a tracing similar to that accompanying scheme No. 3? Yes, there would require to be a tracing before the heliograph could be made.

6894. Then, as compared with the heliographs, the tracing would, as a matter of fact, be the more original? Yes, it would certainly be done before the heliographs.

George Forrest recalled and further examined:—

G. Forrest.  
3 July, 1896.

6895. *Mr. Parkes.*] Will you tell His Honor what land you have in New South Wales which is absolutely in your own name? There is none in New South Wales in my own name. I have only an interest in it.

6896. You say you have only an interest in any land in this Colony? Yes. That applies to all the other property we have in New South Wales. We have some vacant sections.

6897. Is the property in your joint names, in a deed? I could not say.

6898. Is it not in Mr. Carter's name? It might be in his name.

6899. As to your New Zealand property, of what value is it? It would be hard to say. I have never had it valued for sale or for mortgage. For one place I was offered £1,000 cash some years ago, and I was offered £500 for another place within the last eight or ten months.

6900. What other places are there? I have some houses.

6901. What would they be worth? It is hard to say. I have also some vacant sections.

6902. What are they worth? I should not like to sell under £2,500, unless I were pressed for money.

6903. Is there any mortgage upon the property? Not a shilling.

6904. Have you the title deeds here? No; they are in New Zealand.

6905. Have you not drawn regularly a salary out of Carter, Gummow, & Co.'s account from September, 1894, to the present date? Yes.

6906. Have you any cash in the Bank of New Zealand at the present time? No; my account would be very low now. There might be an overdraft, but if there is it would be there for the first time.

6907. *His Honor.*] You have had your New Zealand property valued, I suppose, in a round-about way—What I mean is that you have had to pay rates? Yes, the municipal rates.

6908. At what do you value the property for rating purposes? I could scarcely say without looking at the particulars. I know that I pay about £12 a year for rates. I think the rating is 9d. or 1s. in the £.

6909. Upon the annual value? Yes.

6910. How do they get at the annual value of unimproved land? I pay only 2s. 6d. a section.

6911. What value would that indicate according to their basis of rating? It would not matter whether the section were worth £15 or £1,000, all vacant sections are charged alike. In one of the suburbs, I think only 2s. is charged.

6912. Supposing you had one vacant section in the heart of Dunedin, and another vacant section in one of the extreme suburbs, would you pay the same rate on account of both? I could not say what is the charge in the heart of Dunedin, but I know that in different suburbs it is 2s. 6d. per section. In one of the suburbs, as I have said, it is only 2s.

6913. At any rate, the charge does not give any indication of value? No.

6914. Is there not a land tax in the Colony? Yes, but there is an exemption of £3,000.

6915. And your property comes within that exemption? Yes. There was a property tax for six years before we had the land tax. When we paid the property tax the exemption was £500.

6916. That would be some time ago? Yes.

6917.

G. Forrest.  
 3 July, 1896.

6917. What is the salary you receive from Messrs. Carter, Gummow, & Co.? £10 a week.  
 6918. What would it be for? For management and work.  
 6919. Do you receive it as a partner? Yes, as a partner; we all draw alike.  
 6920. Do you receive it whether you are managing or not? If there is any work to do we always draw the same salary.  
 6921. Suppose there is no work to do? We have to do with half salary then.  
 6922. I understand that there are a good many of the firm's contracts in which you have been concerned, and a good many in which you have not been concerned? I have an interest in them all, although my name does not appear in them all.  
 6923. You have actually an interest in them? Yes.  
 6924. Then you have been a partner in the firm all along? Yes; from the first.  
 6925. From how long ago would that be? Over eight years.  
 6926. In cases where your name has not appeared in the contracts, have you been still a partner? Yes; still a shareholder. [*Vide Appendix 20.*]  
 6927. How have you shared in the profits of contracts in connection with which your name has not appeared? Just the same as in the others.  
 6928. Just the same as in those in connection with which your name has appeared? Just the same.  
 6929. *Mr. Gummow.*] As to your salary,—you receive £10 a week? Yes.  
 6930. Have you received that £10 a week from Messrs Carter, Gummow, & Co. since September, 1893? No.  
 6931. How long have you received it, going back from the present date? I could not say from memory.  
 6932. Have you received £10 a week during the whole time you have been employed by Carter, Gummow, & Co.? Yes.  
 6933. What have you received from Messrs. Carter, Gummow, & Co. when we have not been at work upon contracts? I do not know. I know that the salary was a few pounds less than the regular salary some time ago.  
 6934. Do you remember Mr. Gillan and myself going to Adelaide? Yes.  
 6935. Do you remember what we were to get? £10 each, I think.  
 6936. Ten pounds a week? I could not tell you. I know that at one time we had £7, at another time £8, and at another time, £6 a week; then we came back to £10 a week again.  
 6937. Do you know what the remaining partners were to get from Carter, Gummow, & Co.? They were to get half.  
 6938. £5 per week? Yes.  
 6939. In other words, the working partners got £5 per week, because they were drawing out of their capital? Yes.  
 6940. With regard to your being a shareholder for the past eight years in different contracts, in some of the contracts in which members of the firm have been interested, your name does not appear? No; in the case of the largest contract—the Marrickville contract—it does not appear.  
 6941. Do you consider yourself liable to the Government in connection with those contracts in which your name does not appear? No; I do not think they could come upon me.  
 6942. You did not sign any document rendering yourself liable? No.  
 6943. As to this property in New South Wales, do you know whether your name appears as an interested party in that property? I think it was in Mr. Carter's name, but we had a deed.  
 6944. Do you actually know what deed there is;—do you know, as a matter of fact, whether your name appears or not;—can you be sure? I know there is a deed.  
 6945. Who draws up your deeds;—who does that kind of business for you? Mr. Andrews.  
 6946. Would he know? I should think so, certainly.  
 6947. Do you ever remember signing a mortgage upon any property in New South Wales? Yes.  
 6948. Would that bring to your mind the fact as to whether you were an original shareholder in it,—that is, the deed, or whether it is in Mr. Carter's name only? I could not say.  
 6949. You leave those matters to your solicitor always? Yes; and to Mr. Carter.  
 6950. You feel that you can always trust them? Yes.  
 6951. *Mr. Parkes.*] Is not the Bank pass-book produced yours? Yes. [*Vide Appendix No. 29.*]  
 6952. You appear from this book to have drawn regularly the salary of £43 6s. 8d. from September, 1894, up to the present date? Yes.  
 6953. *Mr. Gummow.*] On 16th October, 1894, there is an entry of £43 6s. 8d. from Carter, Gummow, & Co.;—were you receiving that amount from them at that time? I could not say, I am sure.  
 6954. Were you receiving £5 or £10 a week at that time from Carter, Gummow, & Co.? I do not think I was receiving it from Carter, Gummow, & Co., then.  
 6955. Was it from Carter & Co.? I am so mixed up about the matter that I cannot tell you. I have really taken very little interest in it.  
 6956. You were not particular where you got the sum from, so long as you got the £10 a week? I was not.  
 6957. As to keeping the books,—can you explain what books, if any, were kept by the firm, and how their business was managed? The tram table book was the only book I kept. There was no use for books of any other kind so far as I was concerned. We kept the pay-sheets, and I think that is about all we did keep.  
 6958. Did you keep any ledgers? No.  
 6959. Did you keep any invoice books? No.  
 6960. No books at all? No.

James Conley sworn and examined:—

6961. *Mr. Parkes.*] What is your position in the Department? I am assistant accountant in the Department of Public Works. J. Conley.  
 6962. In the month of April or May, in 1895, did you make any inquiries as to the position, financially, of Mr. Forrest and Mr. Gillan? I have no recollection of having done so. 3 July, 1896.  
 6963. If you had done so, would you not have some recollection of it? I think so.

6964.

- J. Conley. 6964. As a matter of fact, you did not make any inquiry, did you? I could not say positively that I did not, but I do not think I did.  
 6965. Nor at any time previously? No.  
 6966. Did Mr. Darley ever instruct you to do so? I have no recollection of his having done so.  
 6967. Do you know of any officer in your Department who received such instructions? No; they would only do so through me.  
 6968. You cannot recollect whether you went down to the Bank of New Zealand to make inquiries? I do not remember making any inquiries concerning Mr. Forrest or Mr. Gillan, but I certainly did not go to the Bank of New Zealand.  
 6969. You never went there for that purpose? No. May I explain that the custom of Mr. Darley, when sureties were submitted, was to send the papers on to me to make inquiry as to the position of the proposed sureties. He was most careful in that respect—that is, that I should carry out his instructions, which I always did.  
 6970. But in this case what happened? I do not remember receiving any instructions.  
 6971. *His Honor.*] You remember what was going on at the time in the way of shifting the office? Yes. There was great confusion at the time. Mr. Darley might possibly have given me instructions, but I cannot remember them.  
 6972. Where were your offices at that time? In the Public Works building. Mr. Darley's time was very much taken up between his offices at the Water and Sewerage Board and this office.  
 6973. *Mr. Parkes.*] Was not Mr. Darley absent at that time? At what time do you refer to?  
 6974. I mean in the months previous to May, that is, in March and April? No. I know that he was in the office up to the 31st March, and I think also up to the middle of April. I remember his going away some little time after that, but I could not tax my memory as to what month it was.  
 6975. *His Honor.*] Was he away at Easter? I think so, but I could not be sure.  
 6976. *Mr. Parkes.*] He might be confusing this with some other occasion, might he not, in speaking about the sureties; he couldn't have given instructions, for instance, if he were not present? Certainly not, if he were not present.  
 6977. It is possible that in giving evidence the other day he was thinking of some other occasion? Yes; he has given verbal instructions on other occasions.  
 6978. *Mr. Smith.*] Is it not clear from the papers I hand you that Mr. Darley was in the office on the 8th April? There is no doubt, according to these papers, that he was there then.

Thomas William Bryant sworn and examined:—

- T. W. Bryant. 6979. *Mr. Parkes.*] You were lately in the Public Works Department? Yes.  
 3 July, 1896. 6980. What were you doing during the time you were in the Public Works Department? I was in the Accountant's office, and afterwards I was appointed general clerk to Mr. W. A. Smith, Divisional Engineer.  
 6981-2. Did you do his financial work? Yes.  
 6983-4. Do you recollect the payments made in connection with the culvert which was made at Strathfield, on the Parramatta Road? Yes.  
 6985. Did you see reported in the daily newspapers the evidence which Mr. Smith gave here concerning that culvert? Yes.  
 6986. What was the original estimate for that culvert? I could not say, but I believe it was £114 or £120.  
 6987. All the accounts passed through your hands? Yes.  
 6988. And what was the ultimate cost of the culvert? Speaking roughly—and I can only speak roughly because I have been twelve months out of the Service—it was from £250 to £300.  
 6989. Would you undertake to pick out the vouchers upon which the payments were made if you had the books? Yes, I think I could arrive at them.  
 6990. Did the sum of money obtained for that culvert run out? The head of the Department may recommend an expenditure of, say, £115 or £120 for a job, and we should be supposed to keep within that amount. But if when we got on to the work we found that we should require extra expenditure, and if Mr. Smith thought that it would not be prudent to ask the Minister for more money, he used to take money from some other grant.  
 6991. In this case was the sum of £114 approved of? By the Minister—yes.  
 6992. And that was not enough? No.  
 6993. Where did you get the plans from? We knew that a similar work was being carried out for Dr. Manning at Callan Park.  
 6994. Was that work being carried out on the Monier principle? Yes. Dr. Manning got £1,000 from the Chief Secretary, Sir George Dibbs, for certain improvements at Callan Park. Mr. Smith found that the money for the culvert on the Parramatta Road had run out before we had completed the structure, and he told me to finance it from Dr. Manning's vote, which I did.  
 6995. How much did you take from Dr. Manning's vote? I forget now, but I know that we used it freely. Dr. Manning, I know, asked for some extra work to be done, and we found that it would take up the whole of the £1,000, we therefore had to stop using it, and we took the balance from the grant for some work at Blackwattle Bay.  
 6996. How much was taken from that grant, do you know? I could not say. I know that the whole cost of the culvert ran out from £250 to £300.  
 6997. You are sure it did not exceed that? Yes.  
 6998. After you left the Department were you sent for by the Under Secretary to come back and put Mr. Smith's accounts in order? By one of the officers of the Department, and I went and adjusted the accounts.  
 6999. Why had they to send for you? I do not know; but they did send for me.  
 7000. Were you the only one who understood the accounts? I could not say that; but I was sent for, and I adjusted them.  
 7001. So that you and no one else had perfect control over the accounts? Undoubtedly. I was paid for what I did in adjusting them afterwards.

7002. On leaving the service you received a letter of testimonial from the Department, did you not? I T. W. Bryant did not ask for any.

7003. Did you not receive a letter containing these words:—"I am to say that, in appreciation of the satisfactory manner in which you have performed your duties, he has approved of your being allowed two months' leave of absence on full pay, to take effect from the date abovenamed;"—the word "he" refers, I suppose, to the Secretary for Public Works for the time being? Yes; I received that.

3 July, 1896.

7004. And afterwards you were awarded pay for coming back to adjust Mr. Smith's accounts? Yes.

7005. How many months was this after you had left? I think it was about four months, but I have since been engaged in other business, and I have really forgotten about many things which have occurred in the service.

7006. Was it not a laughing matter in the Department—this matter of the Monier work culverts on the Parramatta Road and Callan Park collapsing? It was looked upon as a very costly experiment. I know that, speaking of the Parramatta Road culvert, the inspector said it was a botch of a job.

7007. As a matter of fact, had not that culvert to be sustained by iron plates after all? That is what I heard from one of the inspectors. I heard they had to get some iron plates to shield the work on the Parramatta Road.

7008. Who made those iron plates? That is outside of my knowledge; I did not inquire, but I understood that our own blacksmith had made them. At least that was the effect of the conversation which took place in the office.

7009. Can you tell his Honor what took place on the work at Callan Park, where the Monier principle was also used? No; not from my own observation, because my duties were in the office, but, of course, I heard conversation taking place between the men who came there for their pay. I have nothing to do with the work outside, and I do not understand it at all.

7010. In connection with the general works account is there not a sum of £15,000 put at the disposal of the Under Secretary for Public Works every year? I always understood the Commissioner for Roads could draw upon an advance of £10,000.

7011. He had an account of that nature? Yes.

7012. Is it not a fact that so far as the drawing upon that account is concerned, it can be replenished as they go along—that it can be kept at a standard of £15,000? That I could not say.

7013. Is it not a fact that there is often £30,000 or £40,000 drawn out of that account in the course of the year? I do not think so; I always understood that it was limited to £10,000.

7014. The Treasury has no control over that money at all, has it? That I do not know.

7015. How would the expenditure be accounted for to the Auditor-General;—would it be in detail or in a lump sum? The accountant would probably have to give a general statement to the Auditor-General.

7016. You do not know yourself what is done? No; Mr. Carroll always financed everything for us.

7017. He was the accountant for the Roads and Bridges Branch? Yes. I had nothing to do with him at all, except that he used to advance money for Mr. Smith's account.

7018. *Mr. Smith.*] You are not an engineer? No.

7019. So that you would not be able to express an opinion as to the character of any of the work? No.

7020. Did you ever see the work in question? No, all that I know about it is what I have heard from the conversation of men who have come into the office.

7021. Who was the inspector who said that the work had been botched? There were two inspectors who said so—an inspector on each job.

7022. Did they both say that it had collapsed? They both said that it had collapsed.

7023. What were the names of these inspectors? Bramston and Larkin.

7024. What did one of them mean when he said that the work had been botched? Two of them said so.

7025. One of them also said I believe that the work on the Parramatta Road had had to be supported by iron plates? Yes; that is what I understood him to say.

7026. As to the accounts, you say you are perfectly sure that the cost of that job was from £250 to £300? I said about that. That would include salary, wages, and everything, taking the thing purely as a business transaction.

7027. You mean taking the cost of the whole work, tools, and everything? Yes.

7028. Do you know what the nature of the work was? I understood that it was cement and concrete.

7029. But do you know the nature of the job generally? Nothing beyond that.

7030. You only know that it was the building of this particular culvert? Yes.

7031. But was there not something beside—the removal of the old structure, for instance? That I cannot say, but I believe there was; in fact it must have been so.

7032. You think the old structure had to be removed? I cannot say definitely.

7033. The total cost, including the removal of the old structure, you take to have been £250? What I mean is that the Monier culvert as it stood, that is, the building of the structure, cost £250.

7034. That is as far as you know from the accounts which passed through you? Yes.

7035. If you had the opportunity you could pick out the particular papers containing the cost? Yes.

7036. *Mr. Parkes.*] Where was it that Mr. Hickson gave instructions that the cement was to be bought from? I do not know about any instructions, but the cement was bought with his approval from Carter, Gummow, & Co. for the two works.

7037. Are there vouchers for all the payments that were made? I think so.

7038. They could be found? I think so.

George McCredie recalled and further examined:—

7039. *Mr. Parkes.*] Have you worked out an estimate of what the original departmental plan of Contract No. 77 would cost if the structure were made of exactly the same material as is employed in Contract No. 101? Yes.

G. M. Credie.

3 July, 1896.

7040. What did you find the difference to be? I have made an estimate of the probable cost of the two aqueducts in Contract No. 77, and I find that if similar materials were used in those aqueducts to those in Contract No. 101, they would cost £1,234 less than if carried out in accordance with the departmental design. [*Vide Appendix No. 15.*]

7041.

- G. M'Creddie. 7041-2. Have you also made an estimate as to the saving between the departmental plan of 77 and 101, if the work were carried out according to the departmental schedules? Yes; there is an amount of £1,208 Os. 3d. in favour of the material in No. 101—that is, if No. 77 were built with the material used in that contract.
7043. That places it beyond all doubt that the design in No. 77 is more costly by a long way than is the design in the case of No. 101? Yes; as designed by the Department.
7044. The material you have taken out is only for the structure above the springing of the arch? Yes; the spandrels—all the material that would take the place of the brickwork.
7045. You undertook to provide His Honor with a plan of the work you are doing in the telephone subway, and also to furnish particulars as to the cost of that work per foot run? Yes.
7046. You produce now a drawing of the tunnel? Yes; acting upon your instructions, I have made a drawing of the section of the telephone tunnels for the Electric Telegraph Department at a scale of 2 inches to the foot, and have gone into the cost of their construction, which amounts to £2 3s. 10d. per foot run. [*Vide Appendix H.*]
7047. *His Honor.*] Does that include excavation and all? Yes; pipes, subducts, and all.
7048. The drawing you have handed in shows the subduct? Yes; a 9-inch subduct, with 4-inch pipes running into it.
7049. At what intervals do those pipes run in? It depends upon the nature of the ground. Some would be 10 feet apart and some 20 feet apart. Outside of the brickwork the drawing shows hand-packed ballast.
7050. *Mr. Parkes.*] That forms a weeping drain, does it not? Yes.
7051. *His Honor.*] There is, therefore, a continuous weeping drain at the back of the lining? Yes; you could walk through the tunnel without getting wet at all.
7052. *Mr. Parkes.*] As regards the compo., you have made a practical test by taking the exact material used in these Monier arches? Yes.
7053. Will you give His Honor the particulars as to shrinkage and other matters? Yes; I made a test to find out the shrinkage of compo. mixed in the proportion of three of sand to one of cement, and I find that it amounts to 5 cubic feet in a cubic yard of dry materials. This is from an actual test. I had the materials mixed up dry. After mixing the cement with the sand which is being used upon the aqueducts—and it is a very fine sand—I had them turned over half a dozen times dry. They were thoroughly mixed and set. I have given you the result.
7054. You have gone further into the matter with a view to test the actual value of the material? Yes.
7055. Will you give the figures? Yes; I have taken the actual value of the compo. from this test. I have allowed six and three quarter casks of cement to a cubic yard, because it is specified in some of the specifications, and the result is as follows:—Six and three-quarter casks of cement to 1 cubic yard, at 9s. 6d., £3 4s. 1½d.; 3 cubic yards of sand at 2s. 6d., 7s. 6d.; giving £3 11s. 7½d. as the cost of 3 cubic yards, 7 cubic feet, of compo, making the cost of material, per cubic yard, £1 2s.; timbering, 2s.; labour, 3s. 6d.; profit, 2s. 6d. The total cost per cubic yard placed in position comes out at £1 10s. Should the 62 tons of ironwork in the aqueducts be included in the cost of the compo. it will increase the price per yard by 12s. 6d., making the total cost, including ironwork, £2 2s. 6d. per cubic yard. [*Vide Appendix No. 15.*]
7056. *Mr. Davis.*] In comparing the cost of a subway with the cost of a sewer, I suppose it would be fair to take into consideration the relative cost of material? Yes.
7057. Supposing the bricks in the sewer were of better quality, and therefore more costly bricks than those used in the subway, that would have to be borne in mind? Yes; the bricks in the sewer would be double-pressed as against wire-cut bricks in the case of the subway.
7058. As a matter of fact, the bricks in the sewer would be of better quality than the bricks in the subway? In which sewer?
7059. The sewer you examined the other day? Yes. Of course, double-pressed bricks are a different brick altogether.
7060. In making your experiment with the compo., you said you used a compo. of 3 to 1;—did you ram it? Thoroughly.
7061. You say the experiment was made dry? I mixed the stuff dry, and then mixed it with water. It was put into the box and battered down until the water came out at the top.
7062. There was enough water in the compo. to make it quite soft? Yes; it was like so much mud.
7063. Have you ever tried the experiment with less water to see what difference that would make to the shrinkage;—have you, in fact, seen any of the compo. mixed on the works at Contract No. 77? No.
7064. So that you are not sure that the compo. you mix is of the same consistency as the compo. which is being used upon Contract No. 77? That is an easy matter to settle. As far as I could judge from the consistency of the material, I think it is very like the consistency I obtained. I examined the material very carefully and I mixed the stuff with which I made the test accordingly. I got the material, as nearly as it was possible to make it, similar to that in the aqueducts. I went over to see the material there and carefully examined it before I mixed the stuff for my test.
7065. You have put down 2s. 6d. per cubic yard for sand? Yes.
7066. Do you know whether that is the cost of the sand which is being used on Contract No. 77? No; I took the sand which the contractors are using on No. 77 to be worth about 1s. 6d. per yard, and I allowed the extra shilling.
7067. Supposing, for the sake of argument, that the sand there cost three times the amount you have estimated, that would rather interfere with your estimate of the cost, would it not? If the sand cost three times the amount I have given it would alter my estimate, of course.
7068. You have allowed 2s. per cubic yard for the timbering required for centering, staging, &c.? Yes.
7069. Do you think that estimate would cover the cost? Yes.
7070. Have you measured up the centerings? Yes.
7071. Have you measured up the scaffolding? I took it at 2s. per yard, but in most cases it is taken with the concrete.
7072. You think the cost amounts to no more than 2s. per yard? No.
7073. How do you arrive at 3s. 6d. per cubic yard for labour;—did you make that estimate from your observation of the work? Yes; having regard to the class of work I allowed a little more than I would under ordinary circumstances.
7074. But is your estimate formed from observation of what is being done upon Contract No. 77? Yes.
7075. Have you carried out any Monier work? Not in aqueducts. 7076.

7076. Have you carried out any Monier work similar to that done upon Contract No. 77? Not in aqueducts. I have carried out Monier work—that is, iron put in cement or compo. just in the same way as is being done in this case, although I have not applied it to aqueducts. G. M'Creddie.  
3 July, 1896.
7077. Therefore, your 3s. 6d. per cubic yard for labour is a mere estimate? Yes.
7078. *Mr. Gummow.*] As to the price of the sand, could you tell me where we could get it at 2s. 6d. per yard? I do not think the sand you are using is worth more than 1s. 6d. per yard. I think I am allowing you a shilling more than its actual value.
7079. Where do you think we get the sand we are using? I should imagine that the stone was not taken far from the site where it is being broken up. It looks like ordinary soft sandstone.
7080. Do you know what it costs us to crush? No, I do not, but I know what it is worth.
7081. Do you know where we get the sand from? No.
7082. Have you any idea where we get it from? I have an idea.
7083. Where do you suppose it is obtained from? I fancy most of it is taken out of the excavations. The stone from the excavations is broken up, and the sand is used in the compo.
7084. If that were not so where could we get the sand at the price you have given? We have purchased similiar sand—the same sort of fine sand—for 2s. 6d. delivered.
7085. Where could you get it? We get it from the sandhills.
7086. Would it be equal to the sand we have out there? It would be better, because it would have more grit in it—your sand out there is very floury. I was surprised to see you using such fine sand on the contract.
7087. Do you think the Bourke-street sand would be as good as the sand we are using? I have not tested it.
7088. If the Department would not let us use the sandhill sand, but made us use a sand which came up to the Nepean sand, what would be your impression as to the cost of it? If the Department made you use sand superior to Nepean sand it would be more expensive, of course.
7089. If they made us use sand equal to Nepean sand, would it cost more than 2s. 6d. per yard—if it were equal in strength, judging from the tests, to the Nepean sand, would it be more costly? I would say this, if the sand were similar to the Nepean sand it should be a more expensive sand.
7090. *His Honor.*] You must have had a good deal of experience as regards sand? Yes.
7091. Did you see from the newspaper reports the opinion which Mr. John Young expressed about the Sydney sand? Yes.
7092. I mean as to the presence of clay? Yes.
7093. What have you as an expert to say as to that? I have not gone into that matter, but we prefer for really first-class work, with adhesive power, Nepean sand. It is more expensive. We give 6s. 6d. a yard against the cheaper rate of the sandhill stuff. The sand from the sandhills is good enough for ordinary building purposes.
7094. But the other is sharper sand? Yes; it seems to hold the cement better.
7095. Is it because of the extra sharpness that you consider it better, or is it because of the absence of clay? The absence of clay, I have no doubt, is an improvement. If you take a small bottle of Nepean sand you will see diamond-shaped pieces running all through it.
7096. Have you had any experience of the continued shrinking of compo. or concrete—I mean a shrinkage after it has set? Yes; I have had some experience of shrinkage after setting, and that is the greatest danger I can see in connection with the Monier system. We must have time in which to see whether it will stand. It is a matter for experience as to whether the Monier system will stand in aqueducts.
7097. On the question whether the shrinkage is due to the presence of clay in the sand, you do not profess to express an opinion? No.
7098. Take the ordinary cement used in the facing of buildings, what would be the proportion of sand to cement in good buildings? Two to one for a first-class job. We often put it on in two-coat work.
7099. Ought it, or ought it not, when properly put on, to show any hair-cracks—that is, fine cracks running through it in all directions? It does show hair-cracks, even when it is well put on. We have such a peculiar climate, excessive heat following excessive cold, and that seems to affect the cement. Even in ordinary concrete work, if you go a distance of (say) 7 or 8 feet, you will find a crack in it.
7100. Is it not a common experience that cement facing on walls, unless it be painted, will not keep out water? It is folly to think that cement will keep water out of walls. They must be painted.
7101. How is compo. going to keep water in, when cement upon walls will not keep water out? I could tell you after we have had a little experience.
7102. *Mr. Parkes.*] Is it not the fact that the profession in the city, apart from the Government Department, will not dream of using crushed sandstone as sand;—do you know any one firm of architects or engineers who use it? I never saw it in any specification but the Government specification, and I have never heard of any firm of architects or engineers using it.
7103. Do not the whole profession in the city take the greatest care in getting a good sharp grit in their sand;—do they not take care to see that it is free of any sort of fine particles—that is the first thing they think of, is it not? Yes.
7104. The reason being that any earthy matter or any fine matter in the sand causes an unequal distribution of the cement—is that not so? Yes.
7105. It gets patchy? Yes.
7106. And, therefore, there is an unequal shrinkage when it is set? Yes.
7107. *Mr. Davis.*] Do you know whether the sand specified in the case of Contract No. 77 is crushed sandstone? I could not tell you, but I know the contractors are using crushed sandstone.
7108. You say that you have seen it specified nowhere else except in Government contracts? Yes.
7109. Where have you seen it specified in Government contracts? In the schedule of specifications.
7110. What contracts are you referring to? I could not say unless I looked them up. I know that I saw crushed sandstone provided for or specified in one of the schedules.
7111. What is specified in contract No. 77 with regard to sand? It is to be sharp coarse sand, free from all earth; but that is not the sand that is being used—there is no doubt about that.
7112. The sand specified is sand equal to the Nepean River sand? Yes.
7113. Are you in a position to say that the sand which is being used is not up to that standard? Yes.
7114. That is your opinion? Yes. I say the sand I saw them mixing in the concrete was not up to that standard.
- 7115.

- G. M'Creddie. 7115. Supposing tests had been repeatedly made both of compression and tension from the sand that you say you saw being used upon Contract No. 77, and that that sand stood better tests than the Nepean River sand, what would you say? I should like to see the test made.
- 3 July, 1896. 7116. But supposing tests were made with that result, would you not say that it was conclusive proof? Supposing they did show that result.
7117. As to the clayey matter in the sand, do you not think that ordinary compression and tension tests would indicate the presence of a weakening material of that description? If the sand were tested properly it should.
7118. Coming now to cement facings, you said that if a 2 to 1 compo. were put on the outside of a house it would not keep out the dampness? Yes, I am perfectly satisfied of that.
7119. Have you had any experience of a 1 to 1 compo.? On the outside of buildings, no.
7120. Supposing it were specified in the case of this particular aqueduct that a 1 to 1 rendering should be put both inside and outside, what would you say as to the probable effect which that would have in keeping the sewage from penetrating the structure? I should want to test it. My own opinion is that cement is of too porous a nature to hold water—that it will let water go through it. I have had so much trouble with it in buildings. I have seen work of that kind done with the utmost care from time to time, and it has been found afterwards that it would not keep water out.
7121. Have you tested the porosity of neat cement? No.
7122. Have you tested the porosity of 1 to 1 compo.? No.
7123. So that, in fact, you are not in a position to say that it would be porous? I am in a position to say that a 2 to 1 compo. would be porous, and as to a 1 to 1 compo., I will test it and let you know.
7124. *His Honor.*] Do you know whether, after the final re-building of the aqueduct near the big reservoir at Prospect, it held water perfectly or not? You will find even now that the aqueduct leaks here and there. Of course, before it gave way last time there was a big leakage.
7125. That was bad work, I suppose? Yes.
7126. I suppose the work is all brick, cement, and compo., is it not? Yes; brick piers and cement. I do not know whether they put a pipe in last time or not.
7127. You do not know whether there is now a pipe or a simple carrier? No.
7128. You saw the work when it was first built? Yes. At that time it was something like the Jenolan Caves. There were stalactites hanging down in all directions.
7129. *Mr. Gummow.*] What do you mean by a 5-foot shrinkage in a yard;—do you mean that 32 shrink to 27 feet? Five feet go away in 27. In my former estimate I made the cement disappear altogether, but that is not the case.
7130. If you put in 32 feet does it shrink to 27, or do the 27 shrink to 22? My answer is that 27 feet shrink to 22.
7131. As to the testing of sand, have you had any blocks of sand and cement, mixed together, tested for compression? Yes.
7132. Have you noticed how they crush? Not differently from anything else crushing up.
7133. Do they crush irregularly or on some particular curve;—do they flatten out or do they split up into a certain shape? The one that I saw bulged out. It was what you might call squashed.
7134. Why I asked the question is this, Mr. Parkes, speaking about crushed sandstone, estimated that, on account of the foreign matter which was in it, you would not get such a sound compo. as from the use of the Nepean sand;—supposing there were a percentage of foreign matter in it, would it not be shown in the crushing whether the block which was being tested was a homogeneous mass or not? One ought to stand a great deal more than the other.
7135. But in the crushing are there any particular lines that they should crush to? I could not tell you that.

Cecil West Darley recalled, sworn, and examined:—

- C. W. Darley. 7136. *His Honor.*] I thought you might like to make an explanation of your evidence the other day as to the question of who it was who made inquiries as to the sureties in the case of Mr. Gillan and Mr. Forrest? I was called the other day suddenly, and I did not know what I was to be examined about. I answered the questions put to me as if I had followed the usual practice of the Department—that is, in such cases to send out one of the officers to make the necessary inquiries. I quite forgot at that time who the officer was. I am still under the impression that inquiries were made by one of the usual officers, but I afterwards saw the officers who would be likely to make the inquiries, and none of them could recollect having done so. On looking up the matter, I find that the whole office was at that time in a state of chaos. Departmental changes were taking place. My chief clerk was taken away from me, and I had not him to refer to. Some temporary officer was acting in his place. Mr. Conley, the officer who used to make inquiries in such cases, does not recollect my asking him to do so. However, I would certainly say this—that I made the usual inquiries and obtained the necessary information. I was at that time working partly in this office and partly in the Water and Sewerage Board Offices. I was going backwards and forwards from one office to another. Moreover, I was not at all well at the time; in fact, the doctor had ordered me to desist from further work, so that I have not a very clear recollection of what took place. I cannot tell you now who made the inquiries, but I am certain that I got the necessary information, because I was always most particular in obtaining it. We had a regular system of carrying out that part of our duty, and it certainly would not be likely to have escaped my attention at that time, because the names submitted were then quite unknown to me. I am certain that I did not regard the matter as one of form. I must have made the usual inquiries.
- 3 July, 1896. 7137. You can fix the time when you actually left Sydney, I suppose? I see that my minute was dated April 8th last, and I left Sydney by steamer on the 13th. My impression is that I wrote the minute on Monday, and left on the following Saturday. I have already explained that my office was at the time upset. I cannot even recollect where I wrote the minute—whether I wrote it in the offices of the Water and Sewerage Board or at my office here. I thought yesterday that I might have written it at the office of the Water and Sewerage Board. I thought I might have caused inquiries to be made by the accountant of the Board, and I asked him whether he had any recollection of making them. I found that he had no recollection; but that I did make inquiries, and that I obtained information which I deemed satisfactory, I can positively assert.

7138. *Mr. Parkes.*] Do you remember whether you obtained information to the effect that the sureties were worth £6,000 each? I do not recollect the form in which the inquiries were made, but I must have been satisfied that the two sureties were financially sound. I do not think it was mentioned that they were worth £6,000 each. [*Vide Appendix No. 26.*]

C. W. Darley.  
3 July, 1896.

7139. Could you get information on the point from the manager of the bank? Perhaps I had better explain the course usually adopted in soliciting information of this kind: My accountant (I usually look to him in these matters) would go to the manager or secretary of the Bank of New South Wales, where our account is kept; he would ask whether the persons concerning whom inquiries were being made were known. If no account is kept by the persons at that particular bank, and information is obtained as to where they do bank, the manager or secretary of the Bank of New South Wales, as the case might be, would make inquiries of an officer of the other bank. In this case I do not remember hearing in what bank Mr. Gillan or Mr. Forest banked. In these cases I merely get a verbal report from the bank as to the sureties.

7140. You think this information was not obtained in this case through your accountant? I have already explained my usual practice.

7141. But it was not followed in this case? In this case I am unable to say who got the information. I do not think there could have been any falling away from the usual practice. Not knowing the names which were mentioned, I probably took extra care to get the information. My accountant tells me, however, that he cannot recollect getting it.

7142. *Mr. Smith.*] Supposing that in this case the parties banked at the Bank of New Zealand, I suppose inquiries would not be made directly at that bank? No; we should not go to the Bank of New Zealand, we should go to our own bank, and they would make the necessary inquiries.

7143. You would go first then to the Bank of New South Wales? Yes.

7144. It is all done verbally? Yes. The result of the inquiries is submitted to the Minister in my report. If I consider that the sureties are sufficient, and that they may be accepted, that is all that is ever put on paper.

William Thompson recalled and further examined:—

7145. You have made an estimate as to the cost of the original departmental scheme in Contract No. 77, if it were built with material similar to that used in Contract No. 101? Yes. I took out a 52-foot 3-inch length of aqueduct, executed first in the specified materials, and secondly, in similar materials to those used in No. 101.

W. Thompson.  
3 July, 1896.

7146. You are taking the lineal foot above the springing of the arch? Yes; the piers, brick arches, and carrier are common to both, and are not estimated. It would have been cheaper to carry out the scheme with the material used in No. 101 by 12s. 6d. per foot; at my estimate of value and at the Government schedule rate of Contract No. 77 the cost would be 10s. 6½d. per foot less. [*Vide Appendix No. 17.*]

7147. Therefore, if the method of construction, as far as material is concerned, in No. 101 had been adopted in No. 77, it would have been in the total—how much cheaper? According to my estimate of value, nearly £1,200, and if carried out according to the schedule rates, about £1,050.

7148. *His Honor.*] Did you take into consideration the fact that there was more pier work in the one case than in the other? I have not taken the piers into consideration. The difference comes in in this, that the brick spandril of No. 77 is much more expensive than the spandril in the other case. The stone dressings in No. 77 also add greatly to the cost.

7149. You do not consider the piers in either case? No; because they are common to both.

Christian Herman Ohlfsen-Bagge re-called and further examined:—

7150. *Mr. Parkes.*] You have further examined the Monier arches which are being built at Johnstone's Creek and White's Creek? Yes.

7151. Will you give his Honor your opinion of the work as a Monier construction? Yes; I have drawn up a report, which I will read:—

C. H. Ohlfsen-Bagge.  
3 July, 1896.

1. Commencing at the east end (Johnstone's Creek), I find a transverse joint across the aqueduct, over centre of pier, at end of the sixth small arch.

2. There is a small longitudinal crack over the first arch, along underside of aqueduct.

3. Iron rods exposed (rusted) along underside of aqueduct, in places, and, although that they will be covered by cement rendering, this should not be.

4. Three more small arches, but the aqueduct network standing exposed over the third arch, coated with cement grout.

5. Aqueduct is built with fine bluestone concrete, whereas compo. should here be used for Monier work. The concrete was stepped back over the ninth arch from the east end of aqueduct. This may cause leakage hereafter.

6. Every third pier under the small arches is double the thickness as the intermediate piers; 12 inches and 24 inches in thickness when rendered, I expect.

7. Six more openings not yet arched over.

8. Three large arches completed, with spandril arches above, up to underside of aqueduct; the fourth arch and spandrils also completed up to same level, but the centering still standing.

9. Part of the centering for the fifth arch has been erected; these are all the centerings which I saw. The piers for the sixth and seventh arches are built.

#### White's Creek Aqueduct.

1. Seventeen arches are completed up to the underside of aqueduct, and all the large arches and spandrils are completed up to the same level.

2. The concrete boxes, over first and second large arches, were nearly erected and the wrought-iron netting for some length placed in position.

3. Over the third large arch the concrete boxes not yet erected. The concrete boxes are rigid, but did not seem to be watertight.

4. Over the fourth, fifth, sixth, seventh, and eighth large arches the aqueduct has been built.

5. There is a transverse butt-joint across aqueduct over centre of piers of large arches.

#### Notes.

The work seemed to be at a standstill on the day I examined it, and the stoppage of such a structure will undoubtedly be very injurious to these works.

The disconnected mode of carrying this work out seems to be quite contrary to the mode indicated (as necessary for the Monier system) in the reports on Monier work which have come under my notice.

C. H.  
Ohlfsen-  
Bagge.

3 July, 1896.

The cements used for Monier work at home are, as far as my experience goes, not to be had in the colonies. The home cements used for Monier works are guaranteed by the State—the most perfect cements—and the home patentees' calculations are based on those cements. If such cements are not used here, Monier works are bound to be quite fallacious; it would only be a matter of time.

Allowing even that the contractors have carried the works on with the very best materials obtainable here, they cannot compare with the materials used for such work at home.

7152. You have made some notes also with reference to the Monier patent generally? I have put some notes together to show why I object to adopt the Monier system in preference to the usual system of carrying out works of this character in brick and mortar. They are as follows:—

1. This patent was taken out by Mr. Baltzer without my knowledge simply upon the advertising pamphlet of the Monier patentees received by Baltzer from his brother.

2. Had I known of this, I would have opposed the granting of this patent, as the office knew of the Monier system some years prior to Mr. Baltzer receiving the pamphlet.

3. The patentees at home are specialists, have a special staff of specially-trained workmen of many years experience in constructing models on the Monier system before they undertook the construction of works on this system.

4. The patentees here based their patent solely upon the information contained in these advertising pamphlets, which did not contain the key of the patent.

5. I did not consider the local patentees personally as specialists, although, no doubt, they employed the best tradesmen they had on this work.

6. Mr. Baltzer was not a specialist, had extremely little, if any, practical experience of work, having, so to say, just left the University in Germany; in fact, what he knew of engineering he learnt from me in the sewerage office.

7. The patentees should have a thorough knowledge of sand, cement, and iron; the most accurate knowledge of mixing the exact quantities of sand, cement, and water, together; of using the very best of cement, of exactly the same strength throughout; of using the very best standard sand of the same gauge throughout; and of putting the mortar into the work in the most uniform manner within water-tight centerings and boxes, and of continuing the work comprising each structure (when once commenced) without interruption until completion.

8. The patentee in this instance must be a specialist; and knowing what a time it has taken the home patentees to become specialists, I cannot see how the local patentees could have become specialists.

9. At home the system is not adopted in public works, except in special cases, then the patentee has to carry it out, and the Government insist on the work having stood three years before they return the contract deposit and the securities.

10. If the home Governments had adopted the Monier systems for public works they must have assumed that every contractor and builder was a specialist, which they knew they were not.

11. Therefore, if the Governments adopted this system, the patentees would become the sole contractors for all the works, which, of course, the public would not permit.

12. To avoid this, it would be necessary for the Government to become the specialist, and that would require their officers to acquire the experience and knowledge necessary at home from the home specialists. I am not aware that at present there are any specialists of this kind here.

13. One experiment will certainly not produce specialists, chiefly when it must be assumed that all parties interested are experimenting.

7153. Do you recollect distinctly whether this patent was known in the office for some time before Mr. Baltzer patented it? It has been known since 1888.

7154. Had you pamphlets in the office giving drawings of it? No; but there were three members of the German Association of Civil Engineers, and they got out the papers and monthly reports.

7155. Were any of the papers read before the Royal Society? I heard that Mr. Hickson was going to read a paper there on the Monier system.

7156. Before the patent was granted? I cannot say as to that, but I think it was just before I wrote my first report about the Monier system.

7157. Will you tell His Honor what was the conversation which you had with Mr. Davis about the Monier experiment on the Parramatta Road? I wish to preface what I am about to say with this remark—that as a rule I never troubled myself about anything of the kind in my office. But one day Mr. Davis came to me and said, "You recollect Mr. Hickson saying to you that anybody could carry out that Monier work—well he is just building a culvert on the Parramatta Road on the Monier system. It is being done by one of his road officers—would you like to see it?" I said, "Yes, I should like to see it." Mr. Davis then drove me out and showed me the work. When I saw it, I did not like the manner in which the compo. was being put into the arch, and I mentioned that to Mr. Davis. Some time after this Mr. Davis came to me, and I thought he looked rather pleased. He said "You recollect that culvert on the Parramatta Road. I said that I did, and he observed, "Did you hear anything about it." I said I heard nothing about it. He said "Well, it has collapsed, a dray went over it and it all went smash." I said "That is interesting." That is all I ever heard of it.

7158. He looked pleased, you say? Yes; I can imagine why he looked pleased. He thought it would show Mr. Hickson that if this work were to be done by anyone in the Colony it could be done by only one set of men—the sewerage officers. Of course, we considered ourselves superior human beings.

7159. *Mr. Davis.*] As to this report you have read, you have been in the habit of making progress reports upon public works for a great many years? Yes.

7160. And you have not dropped out of doing so yet? No.

7161. You intend the report you have read to-day to be a progress report upon the present state of these works? It is merely a report setting forth what I have seen.

7162. Who instructed you to make it? Mr. Parkes; he sent me a note and desired me to go out and see the works.

7163. How do you draw a comparison between the materials which are being used upon Contract No. 77 and the materials that are used in similar work in Germany, for I presume that when you say "home" you mean that country? Well, I know for a fact that the cement used for such work at home is not procurable in these colonies for love or money.

7164. How long is it since you were in Germany? I was in Germany up to the end of 1848.

7165. How long is it since the Monier structure was discovered? We have known of it since 1888.

7166. So that it was discovered after you left Germany? Certainly.

7167. You have not seen any of the structures which have been built in Germany on the Monier system? No, but I have been a subscriber to the "Prussian State Builder," which is edited by the State, and which is contributed to by the best professional men sent all over the world to measure and draw any important work that is constructed anywhere. It is published at the State's expense for the benefit of the profession at home, and issued to them at a nominal cost, and I used to get it every year.

7168. You only know from reading what is being done on the Continent;—you do not know from actual observation? I know from reading, and no one else here knows more about the Monier system. I have had samples of the home cement, and I have compared them with the local cement. I have had work done not only with the cement used in Germany but with the cement used in Scotland.

7169.

C. H.  
Ohlfsen-  
Bagge.

3 July, 1896.

7169. Have you compared them with the material which is being used upon Contract No. 77? How could I do that, when the work commenced after I had left the office.
7170. You say that a three years guarantee is the period which is usually taken at home for these special works? Yes.
7171. Do you consider that that is sufficient? That is not for me to say; I am merely stating the conditions the Home Government have made in regard to these works.
7172. But do you think the three years is sufficient? I cannot tell you; but I think that if such a work would stand three years it would probably stand a considerable time.
7173. You think that any defects which are likely to develop would develop three years after the structure is finished? It is extremely difficult to say; I am not prepared to answer that question. I cannot guarantee the work; it may be all right, or it may not. Cement has been known to perish after three years.
7174. Can you from your own experience and knowledge say that cement has perished after it has been three years in a structure of this description? I know from engineering history that after 200 years cement work has been found to be soft, while in other cases it has been as hard as a stone.
7175. From your experience of works of this description have you known cement to fail after it has been in existence three years? I could not say whether it would do so or not. I have not seen Monier work carried out previously.
7176. *Mr. Gummow.* Are you a specialist as regards the Monier system? Not at all; I do not profess to be.
7177. Can you give an opinion in regard to it? My opinion is simply based upon what I have read about it.
7178. You cannot give an opinion from any knowledge of your own? I should not like to do that—I am not a specialist on the Monier system.
7179. With regard to the information you received as to this patent, did you get it first from Germany? Some of it; some of it I obtained in the office.
7180. In what language was the information conveyed? In German.
7181. Was any of it in English? No; I have seen nothing about it in English, except one very short paragraph.
7182. From what you saw in that case do you consider that we should carry out the work? No.
7183. What do you say is the material used in the Monier system—what is the material making the compo. or concrete? The cement is the best cement obtainable on the Continent, tested and guaranteed by the Imperial Government.
7184. What are the other materials which go to make up compo.? Sand and water.
7185. You said that the grains of the sand had to be uniform? Yes.
7186. Do you know if in the Monier system any material larger than sand is used? I have never heard of anything but sand being used in the Monier system, chiefly in water-carriers.
7187. If anything else is used it would be beyond your knowledge? Yes.
7188. When did you make the notes you read to-day about the aqueduct? Since I examined it on the 30th ultimo.
7189. You did not make your notes about Mr. Baltzer at the time when you and he were in the office together? No, I wrote these notes recently.
7190. Do you know the key to the Monier system? No.
7191. You spoke the other day about the continuity required in the construction of this work, and the same point came up to-day;—do you know whether the Monier system is used in the floors of warehouses? Yes.
7192. How do they obtain continuity in that case? From what I am told plates are sold, and these are fitted together just as timber would be fitted.
7193. But do they make the floors of the system by actually building them in position? I do not know. From what I have read I think they make plates, and that these are sold and put into position.
7194. Your information on the question appears to be very limited? I am only telling you what I have read about it.
7195. You say you do not consider the boxing upon Contract No. 77 water-tight? No.
7196. Were they doing any work the time you were there? No; I have not seen any work done there.
7197. You did not see them putting any stuff into the boxing, and then make the discovery that it was not water-tight? No, there was no one upon the works when I was there.
7198. Do you know of any failures at home in the use of this system? I know from my reading that when this work was started they thought that anyone could do it. It was tried by the Government and by private persons, and they failed signally.
7199. But during the last two years have you heard of any failures in connection with the Monier system? No, because it is only carried out by the patentees, and I have not read of any failure on their part.
7200. Who was at the Strathfield Monier arch when you went there with Mr. Davis? No one else.
7201. As to Mr. Davis informing you about the arch breaking, you say that he seemed pleased? I think, naturally.
7202. Do you know whether he thought that what he was telling you would give you any pleasure? I was amused at it.
7203. It pleased you? I got the idea that his pleasure emanated from the belief that a superior class of men were to be found in our office.
7204. And he thought the failure would give you pleasure too? Yes.
7205. As to concrete arches, did you ever object to their being used in connection with Contract 112? I knew that concrete arches were a novelty; I have myself seen on our own works failures in concrete arches, either from the want of water-tight centring, or perhaps from rubbish having been put in.
7206. Piano cases? I do not say that. I do not wish to say anything to hurt anybody, but I remember that in the case of our own works Mr. Davis showed me certain concrete work, I believe on the Darling Point sewer where it goes over the flat, which was defective. He drove me out there, and I remember his saying, "You ought to see that work in those concrete arches." When we got out there we found several concrete arches—I forget how many now—very much injured and cracked. They had to be taken down again. I remember my putting my knife in, and finding, instead of cement, nothing but sand. Mr. Davis was very much shocked about it, because he thought he had put one of the most reliable inspectors there to supervise the work. We found, also, some brick lining there which contained nothing but dry sand in the joints. I make these remarks to illustrate the danger of using concrete work at all unless it is done honestly.

- C. H. Ohlfsen-Bagge.  
3 July, 1896.
7207. But supposing it is done honestly? Then it may be all right.  
7208. You never raised any objection to these concrete arches being built? Not at all. We did a lot of concrete work, but we found also a lot of cracks in the work, owing to defective materials, workmanship, or supervision.  
7209. You were in the Department a number of years? Fifteen years.  
7210. You have been an engineer over fifty years? Yes, and as a commencement I served my time as a mason when I was 15½ years old.  
7211. You are always satisfied to carry out your works upon the old English system? I prefer the old English system to any new system I do not understand.  
7212. You prefer to rely upon your previous experience to rushing into any modern system? Rushing into any system which I do not understand, and concerning which I have not sufficient information.  
7213. It is of no benefit to you to introduce any new system? Not the slightest.  
7214. And its introduction might involve some risk to your professional reputation? Exactly. I do not like to see a thing fall down.  
7215. It might injure your professional reputation if anything happened to a new design? Most decidedly. I built the Ballarat reservoir, 80 feet high, without a blemish or settlement—as tight as a water-bottle; but I built it upon old principles, such as I knew to be in vogue in Holland and in the north of Germany. If you construct a work upon those principles it will be watertight, but it may not be, and has been proved to be in many cases not watertight, if you follow some of the modern systems.  
7216. It suited you better to adhere to the old system rather than run a risk by introducing a new system? Not necessarily. If I could be convinced that a new system were right, and if I could calculate it properly and specify it properly, and have it carried out properly, I would be prepared to give it a trial.  
7217. In other words, if you knew anything about it? Yes; we do not know sufficient as yet.  
7218. *Mr. Davis.*] Do you remember any flat across which the Darling Point sewer runs? I may have been mistaken in the sewer. It is now more than sixteen months since I have seen the different designs. At any rate, the sewer referred to is not very far from the Darling Point sewer.  
7219. Your memory may have been a little at fault? Yes; but you know exactly where those arches are.  
7220. It is possible that your memory may have been at fault in other respects? You know very well that it is not. You know that you showed me those broken-down concrete arches, and you know that you were very much astonished to see them.

John Carter recalled and further examined:—

- J. Carter.  
3 July, 1896.
7221. *Mr. Parkes.*] Is not the Lodge property at the North Shore in your wife's name? It is in my name, in Mr. Snodgrass's, and Mr. Forrest's.  
7222. Have you any property at all in your wife's name? No.  
7223. I see the deeds were lodged in the Bank of New Zealand in 1891, in which J. Carter appears to have been the administrator of E. Carter? That is my own private property under my father's will, I think—that is, if it refers to me at all, but I doubt whether it does so.

Harold Francis Norrie recalled and further examined:—

- H. F. Norrie.  
3 July, 1896.
7224. *His Honor.*] You hand in a list of sewerage contracts in which sureties were taken? Yes. [*Vide Appendix No. 27.*]  
7225. Is that a correct list of all water and sewerage contracts in which sureties were taken in lieu of cash deposits? Yes, during the period asked for. Of course, Carter, Gummow, & Co.'s sureties in connection with Contract No. 77 are also enumerated.  
7226. *Mr. Parkes.*] In no case were any of these sureties connected in any business with the contractors? Not to my knowledge. You will see that in some cases the occupation given of a surety is as that of a contractor.  
7227. But the sureties were not in any way connected with the contracting firms? Not so far as I am aware.

MONDAY, 6 JULY, 1896.

Richard Butler Rigg, sworn, and examined:—

- R. B. Rigg.  
6 July, 1896.
7228. *Mr. Parkes.*] What is your present position? I am assistant manager of the Bank of New Zealand.  
7229. What were you in the Bank of New Zealand in the year 1895? Assistant manager.  
7230. In April and May of that year? Yes.  
7231. Prior to the month of July in that year were any inquiries made of you as to the position of Mr. Gillan and Mr. Forrest as sureties in connection with any Government contract? Not that I know of.  
7232. No inquiries were made of you? None.  
7233. Not through the Bank of New South Wales? Not to my recollection.  
7234. Do you remember any being made by any officer of a Government department? As far as I can recollect none were made by anyone.  
7235. Therefore you did not report to the effect that Mr. Gillan and Mr. Forrest were reliable sureties for the sum of £12,000? As far as I can remember—no.  
7236. Would any other officer of the bank be likely to make such a report? Only the manager.  
7237. And did the manager make such a report? That I do not know.  
7238. Do you know the positions of Mr. Forrest and Mr. Gillan? Pretty well, I think.  
7239. Would you recommend them as sureties for the sum of £12,000? I think they could find that sum pretty well between them if they were sold up.  
7240. Suppose you were referred to now, would you recommend them as sureties for that amount? I never recommend anyone for any amount; I simply state the position of the persons. Mr. Gillan and Mr. Forrest are men who, as far as I know, are worth from £4,000 to £5,000 each.  
7241. What you mean is that they would be worth that amount if they were sold up? Yes. They might be worth more.  
7242. What amount has Mr. Forrest to his credit in the bank at the present moment? He may have a few pounds. I think he has temporarily an account with us, but he does not bank with us as a rule.  
7243. Mr. Gillan banks with you? Yes.  
7244. What is the state of his account? I cannot say at this moment. You have been furnished with a statement, and that should show you. [*Vide Appendix No. 30.*]

7245.

7245. That statement is correct, is it? Yes.
7246. Have you lately informed Mr. Hickson that he can rely upon these men as sureties? No. I never informed him about them at all.
7247. Has he spoken to you about them lately? He asked me the other day if any inquiries had been made of me, and I said that there had not been any.
7248. On what date was this? Two or three days ago.
7249. Did he then ask you about the position of these gentlemen? Not directly. He asked me if I had reported to the department concerning them, and I said I had not. I do not remember at this moment whether he asked me about them directly; but I think I told him I considered them men who were worth about £5,000 each.
7250. Would you tell his Honor the position of Mr. Gillan's and Mr. Forrest's accounts in the year 1895? Mr. Gillan had a balance of £52 18s. 6d., and Mr. Forrest a balance of £353 10s.
7251. Over and above that amount of money in their banking accounts, had they other moneys with you? Not in 1895.
7252. At the present time Mr. Forrest has a debit balance in his account, has he not? I think last week he was overdrawn to the extent of about £5—speaking from memory.
7253. Do you know the accountant of the Public Works Department? No.
7254. You have never seen him? Not that I know of.
7255. He has never made any reference to you as to these sureties? No.
7256. *Mr. Gummow.*] Do you know Mr. Forrest's and Mr. Gillan's positions apart from their banking accounts? As to Mr. Forrest, I have always understood since I came to Sydney in 1891 that he had a third share in the firm of Carter & Co. At that time the firm was known as Carter, Snodgrass, and Forrest. That is how I made him out to be a man worth £4,000 or £5,000. As to Mr. Gillan, I understood that he had a full fourth share in the old firm of Gummow, Gillan, & Co. I supposed that their capital would be worth more than £10,000. Mr. Gillan has had over £1,000 on fixed deposit at various times. I therefore regarded him as a saving man quite outside of his having an interest in the firm. That is really all I know about them.
7257. Do you know if Mr. Forrest has a private banking account elsewhere? I think he has. I always understood that it was so; I know that we are not his bankers.
7258. Do you know if Mr. Gillan has an account anywhere else? I do not know.
7259. Do you know if he has an account in Adelaide? I have not heard. I know that he is in Adelaide.
7260. *His Honor.*] I suppose that as bankers you get a pretty good idea of the general financial credit of clients and other persons? Yes, concerning anyone doing business with us in any way at all, we are able to form a pretty good idea.
7261. What in 1895 was the state of the general financial credit of Mr. Gillan? We looked upon him as a man worth £4,000 or £5,000, being in the position in which we supposed him to be as a member of the firm of Carter, Gummow, & Co.
7262. But outside of that, and taking his repute for honesty and that sort of thing, how does he stand? I always looked upon him as what we should call a responsible and substantial man.
7263. And what have you to say concerning Mr. Forrest in the same relation? I happen to have known him for nearly twenty years. I think very highly of him. I knew him when he was a contractor in Dunedin.
7264. And how has his reputation stood? It has always been good as far as I know. I never heard of anything against him. I was going to add that I have not seen so much of Mr. Forrest here, but that I have had a good deal to do with him in New Zealand, when he was a member of the firm of M'Gill & Forrest.
7265. What in your experience as a banker does it indicate when a man is in the habit of becoming a fixed depositor? He is generally a thrifty man. I should say, too, that he was somewhat conservative.
7266. He would be very slow to make wild-cat investments? Yes. I should say that as a rule the man who had a fixed deposit would be a conservative man.
7267. *Mr. Gummow.*] You have had dealings for a good while with members of the firm of Carter, Gummow, & Co.? Yes, ever since I have been in Sydney, for a period of five years.
7268. Will you express an opinion as to how you regard them, speaking in the light of the business transactions you have had with them? I should feel inclined to give them anything they asked for. If they had come to me and had wanted £5,000 I would give them it without security, and I do not know of a better test than that.
7269. You have no reason to doubt the integrity or honour of Mr. Gillan or Mr. Forrest? Not at all. Of course as you are aware they do not arrange the finances of the firm.
7270. Do you not consider them at all? Yes. I have no reason whatever to doubt them. Of course the financial arrangements of the firm are made always by yourself and Mr. Carter.
7271. You have no reason to doubt the members of the firm in any way? Not any.

R. B. Rigg.  
6 July, 1896.

George Alexander Wilson, sworn and examined:—

7272. *Mr. Parkes.*] You were lately manager of the Bank of New Zealand in Sydney? Yes.
7273. Were you manager in May and June, 1895? Yes.
7274. Were any inquiries ever made of you by any officer of the Public Works Department with reference to Mr. Forrest and Mr. Gillan, as sureties in connection with the contracting firm of Carter, Gummow, & Co.? I do not recollect any such inquiries. Had they been made by any officer of the Public Works Department, of course they would not have been answered.
7275. Whose inquiries would you have answered then? I might have answered inquiries by a bank.
7276. Were such inquiries made by any bank manager? Not to my recollection; but it is quite possible that they have been made. Hundreds of such inquiries were made of us. There would be no record of them unless we were written to; if that were done there might be an answer in writing.
7277. But the inquiries would not be always made in writing? No.
7278. You say that, as regards these two sureties, you do not recollect any such inquiry? No; I recollect various inquiries about the firm, but not about the individual members.

G. A. Wilson.  
6 July, 1896.

7279.

- G. A. Wilson. 7279. The names of Mr Forrest or Mr. Gillan were never specifically mentioned? I do not remember that being done.
- 6 July, 1896. 7280. Had you lately any conversation with Mr. Hickson concerning Mr. Forrest or Mr. Gillan? I had a conversation with Mr. Hickson about the firm, I think, and the names of Mr. Forrest and Mr. Gillan may possibly have been mentioned.
7281. As members of the firm? Yes.
7282. On what date was that? I suppose it would be about six weeks or two months ago. The matter was mentioned incidentally in conversation.
7283. What did you then report? I reported that Mr. Gillan was a man of some means.
7284. What property has he in New South Wales? That I do not know; but I know that he has means.
7285. How do you arrive at that conclusion. Had Mr. Gillan a very extensive business with your bank? Not very extensive; but it showed that he was a member of a firm who were carrying on large contracts, and moreover that he could afford to have money idle.
7286. In what concerns was he interested? He was a member of the firm of Carter, Gummow, & Co.
7287. Was he a full share partner? I do not know anything about that. I never had any business with him connected with the firm. Mr. Carter always transacted the business of the firm with me.
7288. Do you know the state of Mr. Gillan's account in the months of May or June, 1895? I could not say now what it was; but I know that he was a man of means.
7289. Do you know what amount of money he had in the Bank of New Zealand at the time you left? I could not say now what the amount was.
7290. When did you sever your connection with the bank? In January of this year.
7291. And you cannot recollect what was the state of Mr. Gillan's account then? No.
7292. *Mr. Smith.*] I suppose it is a usual thing for banks to inquire of one another as to the financial standing of individuals? Yes; it is done daily.
7293. As a rule it is done verbally? Yes; some banks will not give the information in writing.
7294. You do not keep a record of these inquiries? No.
7295. Suppose the Bank of New South Wales had made inquiry of you as Manager of the Bank of New Zealand, in March or April, 1895, as to the financial standing of Mr. Forrest, what would you have said? I could not have said much about Mr. Forrest, because I do not know as much about him as I do about Mr. Gillan.
7296. What would you have said supposing inquiry had been made of you concerning Mr. Gillan? I should have said that he was a thoroughly sound man financially.
7297. *Mr. Gummow.*] Do you know whether Mr. Gillan has an account with any other bank? I could not say.
7298. Could you tell me whether he has used his account in Sydney as an ordinary daily working account? I think not. I believe I was told that he had an account in one of the other banks—I think in the Australian Joint Stock Bank.
7299. You know that he is in Adelaide? I knew that he was in Adelaide. I do not know if he is there now.
7300. You do not know whether he has a banking account there or not? No.
7301. As to the firm of Carter, Gummow, & Co.—what was your opinion of them while you were Manager of the Bank of New Zealand, and while they were doing business with you? I had the highest opinion of them from a banking point of view.
7302. Do you consider them financially sound? Yes.
7303. Were they business-like in their transactions as far as you were concerned? Very.
7304. Did they carry out their promises—was their word their bond? Always.
7305. You had no reason to doubt them in any way? No.

Harold Francis Norrie, recalled, and further examined:—

- H. F. Norrie, 7306. *Mr. Parkes.*] On 26th September, 1895, you wrote a letter in which you say,—
- 6 July, 1896. The contractors executed such a bond on 16th May last, and on the same date Messrs. James Gillan, of Dulwich Hill, householder, and George Forrest, of Marrickville, householder, entered into similar bonds in the sums already named. The sureties furnished the usual statutory declarations that they were respectively worth £6,000 over and above all their just debts and liabilities of every kind.
- Did you write that letter at the instigation of the Minister? No, as nearly as I can recollect the Under Secretary of the department asked me what had been done in the matter and I thereupon wrote that minute.
7307. It was directed to Mr. Barling, was it? It was directed, I think, to the Under Secretary.
7308. Was it for the use of the Minister? I do not recollect that I was told that.
7309. On what grounds did you make the statement that the sureties were respectively worth £6,000 over and above all their just debts and liabilities of every kind? I did not make that statement.
- 7309½. I presume you made inquiry before you executed this document? No. Inquiry had been made by other persons, I presume.
7310. *His Honor.*] You made no independent inquiry? No.
7311. *Mr. Parkes.*] From whom did you take your information? I took the declarations themselves.
7312. Had you noticed the nature of the declarations. For instance, look at the declaration of Mr. Forrest on page 121 of the parliamentary papers. He says:—
- I, George Forrest, of Marrickville, in the Colony of New South Wales, householder, do hereby solemnly declare and affirm that I am possessed of property to the value of £6,000 sterling and more, and that such property consists of—Freehold property, £5,700; cash in bank, £300 sterling. And I make this solemn declaration as to the matters aforesaid, according to the law in this behalf made and subject to the punishment by law provided for any wilfully false statement in any such declaration.
- If you had read that would it not have struck you that the declaration was very indefinite in its terms? Well it is not quite so full as those which I am using at the present time.
7313. Ought there not to have been included in that declaration property in the Colony of New South Wales? I do not know that that should have been done. The declarant made a statutory declaration that he was worth the sum mentioned.

7314. Did you not know that Mr. Forrest and Mr. Gillan had an interest in the firm of Carter, Gummow, & Co.? I knew that both of them had been interested in previous contracts with Mr. Carter and Mr. Gummow. H. F. Norrie.  
6 July, 1896.

7315. Should not that have led to your making more strict inquiry, especially when you were going to take an exceptional security, as in this instance? The practice has been for the head of the branch to satisfy himself that the sureties were proper persons, and subsequently to take declarations from them that they were worth the amounts of the respective bonds.

7316. Did the head of the Department satisfy you in this case that the men were all right? It was not for me to call upon him to do so.

7317. How did the names of Mr. Forrest and Mr. Gillan come before you? The papers came before me with the names of Mr. Forrest and Mr. Gillan as the proposed sureties.

7318. Did you ask Mr. Hickson whether the bondsmen were all right? No.

7319. Did you ask Mr. Forrest or Mr. Gillan to state in what position they were? As a Justice of the Peace I took one of the declarations myself, and I put the usual questions to the declarant.

7320. In which case was that? I do not recollect in which case it was—I know that he declared that the contents of the declaration were true.

7321. Did he tell you what property he held? Yes; I recollect that when he gave his address at Dulwich Hill he said that he lived there on his own property.

7322. Did you make any inquiries as to the value of that property? No.

7323. Did you make any inquiries at all—for instance, did you ask the declarant where he banked? No; I made no inquiries whatever.

7324. *Mr. Smith.*] It is no part of your duty to make any inquiries? No.

7325. If you look at page 209 of the Parliamentary papers, you will see there a minute by Mr. Darley as to these sureties, that was approved by the Minister and minuted on to you, so that you had your ordinary instructions to prepare the usual documents? Yes.

7326. And upon those instructions you acted in the ordinary way? Yes.

7327. The ordinary course as to sureties prior to that date was not to take a declaration in all cases? Quite so.

7328. But in this case, for more abundant caution, you took a declaration from each surety? Yes.

7329. But you made no inquiry as to their standing, that being no part of your duty? No. I may mention that I had been for a number of years in the Crown Solicitor's Office, and I carried out down here the same practice I carried out up there. But in this case, the bond being larger than usual, and considering that it must be in force for at least three years, I took the precaution of taking a declaration from each surety.

7330. *His Honor.*] Do I understand that that had been done before only occasionally? If it had been done before it was only occasionally, but I cannot at this moment recollect a case.

7331. Upon what grounds do the Department usually go when they take bonds of sureties? The head of the branch takes the responsibility of making inquiry. I was never asked to make any inquiry as to the *bona-fides* or stability of the sureties. The head of the Department—that is, the Government Architect, the Engineer-in-Chief for Public Works, or the Engineer-in-Chief for Harbours and Rivers—when the matter was referred to him, would say whether the sureties should be accepted or not. In some cases they would accept the sureties, and in other cases reject them. If the sureties were rejected others would be asked for.

7332. You do not know what inquiries the head of the branch made in this case? No.

7333. You only attended to the machinery? Quite so.

7334. *Mr. Parkes.*] When you wrote your minute or letter to the Under Secretary, did you not observe that it was not correct and according to the declaration? I had not the declaration before me when I wrote that minute. Some of the words set out there are words which are used now in the declarations.

7335. But the declarations in this case do not set forth that the sureties are worth £6,000 over and above all just debts and liabilities of every kind? There are half a dozen words there which do not appear in the declarations.

7336. Then why did you write to Mr. Barling to that effect? I took it for granted that the declarations they had made were in the form of the declarations which are made at the present time.

7337. You furnished the declaration yourself, did you not—you were in the habit of drawing declarations of this sort? It is possible that I did draw the declaration, but I am not quite sure upon the point. I had with me at the time a clerk who had served his articles in Scotland, and I am not sure whether he drew up the declaration or whether I did so.

7338. But you knew the wording of it? Practically, I did.

7339. *His Honor.*] I understand that you made a mistake? Yes, When I saw the papers in print I saw that I had made a mistake to the extent which I have just explained.

William Joseph Larkin sworn and examined:—

7340. *Mr. Parkes.*] You were formerly in the Public Works Department? Yes.

7341. In what part of the service were you? I was foreman in the Metropolitan District under Mr. W. A. Smith. W. J. Larkin.  
6 July, 1896.

7342. When did you leave the Department? At the latter end of January, 1895.

7343. Do you recollect the works in your charge at Callan Park? Yes.

7344. Do you remember an open aqueduct being built there? I remember a culvert being built there on the outlet sewer.

7345. There were some Monier plates used in the construction? Yes.

7346. What happened to them? After the plates were put in they collapsed.

7347. And then what steps were taken by the Department? An order was then given to get rails in from Dover Point. I believe those rails were cut up and put under the plates to support them, but that would be after I went away. I do not know of my own knowledge whether that was done or not.

7348. Do you know who carted the rails to Callan Park? A day carter named Wilson. I gave instructions to him to go to Dover Point and bring the rails in.

7349. Who cut the rails? Parbury, the departmental blacksmith, who was working at Iron Cove.

7350.

- W. J. Larkin. 7350. You recollect a culvert on the Monier system being built on the Parramatta Road? I know that it was built there, but I was not there in the course of the construction. [*Vide Appendix No. 10.*]  
 6 July, 1896. 7351. You were told that something had happened to that culvert, I believe? I was told that it had collapsed.  
 7352. Who told you? I heard several men speak of it. It was the subject of general talk among the men.  
 7353. Did you hear that in that case the plates were also supported by iron? Yes; I heard that iron was put in.  
 7354. And that the iron was cut by the departmental blacksmith? Yes; I heard that the blacksmith cut the iron that was wanted. I do not know what was actually done, because my instructions were not to go near that culvert. Mr. Smith told me not to go near any work that Inspector Bramston was carrying out.  
 7355. Did you ever have any conversation with Bramston? No.  
 7356. Did you ever have any conversation with one of the maintenance men on the Parramatta Road? Yes.  
 7357. What did he say? He said that the culvert there had collapsed.  
 7358. What is his name? William Brown.  
 7359. Could you tell His Honor the name of any men who were working there? Ahearne, John London, Gilson; and I think Ryan and another man who was working at Callan Park were also there.  
 7360. Did you give any instructions concerning the cement to be used upon these two works? I sent the drays for it.  
 7361. Where did they go to? I do not know where they went for the cement.  
 7362. Was the cement obtained from Carter, Gummow, & Co., do you know? I do not know.  
 7363. *Mr. Gummow.*] Had Carter, Gummow, & Co. anything to do with these constructions? Not as far as I know.  
 7364. *His Honor.*] As to the collapse of this work, first of all what was the span of the arch in the culvert? I think it was about 5 feet across the top. That was at Callan Park.  
 7365. Do I understand you to say that you saw the arch being constructed? Yes, I got the moulds made. It was my duty as foreman to supply all the material for the work. I had to see that the men went to work, and that all the necessary material was supplied to them.  
 7366. Tell me all about the collapse—how it was that the arch collapsed? After the Monier plates were laid upon the top of the sewer they collapsed from their own weight. Two or three of the blocks sagged down in the centre.  
 7367. After the centering was taken out? Yes.  
 7368. How long was the centering left in? They were flat plates laid across the sewer. They were not arches.  
 7369. Then there would be no centering? There was centering, but it was removed before the plates were laid on.  
 7370. They were simply flat Monier plates? Yes.  
 7371. Of what thickness?  $2\frac{1}{2}$  inches.  
 7372. With a span of 5 feet? Yes.  
 7373. Did they sag down in the middle before any weight was put on them? There was no weight to go over them.  
 7374. Then what was the object of covering the culvert—were not the plates under a roadway? No. They were simply intended to cover up the sewer. It was the entrance to the reclaimed portion of the park.  
 7375. They were simply put on to the top of the sewer as a cover? Yes.  
 7376. But I suppose they were intended to bear the weight of a man, or some weight of that kind? Yes.  
 7377. But they were not intended to be covered over with earth? No; I do not think so.  
 7378. You say they were only about  $2\frac{1}{2}$  inches thick? I think that was about the thickness.  
 7379. They were made of a grill in compo.? Yes.  
 7380. Who made them? Gilson and London were the two men who mixed the compo. They were made on a platform alongside the work, and then moved on to the top of the sewer.  
 7381. How long after they were made was it when they were laid? I think it would be about four weeks from the time they were made until they were put on.  
 7382. Did they sag down at once? In a few days. I was carrying out other work at the time, and I was backwards and forwards at this place nearly every day.  
 7383. Were the plates quite flat? Yes.  
 7384. *Mr. Gummow.*] What cement did you use? I could not tell you what brand of cement was used.  
 7385. Was it cask cement or bag cement? Cask cement.  
 7386. *His Honor.*] Do you know the proportions of sand and cement which were used in the compo.? No.  
 7387. *Mr. Smith.*] As to the talk you heard about the falling down of these arches—did it refer to the work on the Parramatta Road as well as to Callan Park? Yes.  
 7388. You are sure that you heard the men say that the Parramatta culvert, as well as the culvert at Callan Park, had fallen in? Yes.

Joseph Barling sworn and examined:—

- J. Barling. 7389. What is your position at the present time? I am a member of the Public Service Board. I have been in that position from January of the present year.  
 6 July, 1896. 7390. Prior to that date what position did you occupy in the Public Service? I was Under Secretary for Public Works.  
 7391. As Under Secretary for Public Works all transactions which went before the Minister would be submitted to him through you? Yes, as a rule they would be.  
 7392. Do you recollect when the sewerage Contract 77 was signed? I do not remember the day on which it was signed.  
 7393. But you recollect the signing of it? I recollect that it was signed, but I did not see the signing of it.  
 7394.

7394. Did you consider the substitution of the Monier patent plan for the office design to be very risky? There was a certain risk, perhaps; although as far as I can understand it was not very great.
7395. You were a member of the Board of Reference at that date? I was Chairman of the Board.
7396. You recommended that in connection with this work special sureties should be taken? That was recommended by the Engineer-in-Chief for Public Works, Mr. Hickson, to the Minister.
7397. He recommended, you say, that special sureties should be taken? Yes, to cover any possible risk that might arise.
7398. Did you understand that those sureties were to be disinterested parties—that they were not to be associated with the contractors? They would be of no value unless they were disinterested. They certainly should not be interested in the contract.
7399. Or associated with the firm who were carrying out the contract? They certainly should not be connected with the firm who were carrying out that particular contract.
7400. On 9th April, 1895, you sent on the names of the two sureties, Mr. Forrest and Mr. Gillan, for the Minister's approval? Yes; they having been recommended by Mr. Hickson and Mr. Darley.
7401. What did you understand with reference to these two gentlemen? I took the advice of Mr. Hickson and Mr. Darley on the subject. I made no personal inquiry—in fact it would be utterly impossible for me to do so. There are let in the Department from 3,000 to 4,000 contracts a year, ranging over a large number of public works, and it would be utterly impossible for the Under Secretary to institute personal inquiry into such matters. Officers of the Department make inquiries, and as the result of those inquiries the names are put before me, and by me submitted to the Minister.
7402. Did you know whether, as a matter of fact, the gentlemen you have named did make inquiries? I know it from the papers.
7403. But you do not know it as a matter of fact? No; I made no personal inquiries at all. I took it to be quite sufficient that I had the advice of men of such standing as the Engineer-in-Chief for Public Works and the Engineer-in-Chief for Sewerage Construction.
7404. Had you known that Mr. Forrest and Mr. Gillan were partners in the contracts of Carter, Gummow, & Co., and Carter & Co., would you have accepted them as sureties? I certainly should have objected to them had I known that they were interested in that particular contract. I do not know that I should have objected to them as sureties had they been partners in some other contract.
7405. Suppose you had known that they had been formerly interested with these firms in from twelve to thirteen contracts, would you have accepted them? It all depends upon what could be shown as to their financial standing. I thought I had very complete evidence upon that point. In the first place, I had the advice of Mr. Hickson and of Mr. Darley, and, further, there were the statutory declarations made by each of the two gentlemen named as sureties that they held property to the value of the amount of the bonds, viz., £6,000 each.
7406. Did you understand from their declarations that they were worth property of the value of £6,000 over and above their indebtedness of every kind? I think so. If I remember rightly, that is set forth in the declaration.
7407. You would not have accepted them if you had not understood that? I should not like to say now what I should have done under the circumstances. Had it been proved that they were not worth the amount named I certainly should not have recommended their acceptance as sureties.
7408. Supposing it to be proved that Mr. Forrest was enjoying an interest in the firm of Carter, Gummow, & Co. in respect of Contract 77, would you consider the arrangement a proper one? If he were interested in that particular contract he should, of course, have been refused as a surety. I question whether he should have been accepted.
7409. But would it not have been a most improper thing to accept him—is it not altogether beyond question? I should not think it a right thing to accept him as a surety if he were interested in that particular contract.
7410. But is it not altogether beyond question. What is the good of sureties if that sort of thing is to be done. They ought to be absolutely disinterested, ought they not? In the particular contract, yes.
7411. Did you know that Messrs. Carter, Gummow, & Co. were connected with Mr. Forrest and Mr. Gillan in former contracts? I think I can say yes to that; but in the press of business I did not think very much about it, seeing that I had the recommendations to which I have referred before me.
7412. But considering what you knew about the connection of these two gentlemen with former contracts, would it not occur to you to make inquiries concerning them? I do not know that it did occur to me, or that it could be expected that I should do so. I supposed that inquiries had been made. I had the advice of the officers to whom I have referred, and I do not think that as Under Secretary for Public Works I ever made a personal inquiry. In cases of this kind the Under Secretary is obliged to act through the officers of the Department.
7413. But you sent a report to the Minister that these gentlemen were worth £6,000 each after their just debts had been satisfied, and that they were perfectly dissociated from the firm of Carter, Gummow, & Co.? That they were perfectly dissociated from the firm of Carter, Gummow, & Co. so far as this particular contract was concerned.
7414. It did not make any difference, you think, that they had been associated with the firm in former contracts? If they had been connected in other business with the firm that would not disqualify them for the position of sureties in connection with this particular contract if they showed that they were worth £6,000 each.
7415. Then what is to prevent all contractors from combining against the Government? It is impossible to take security against conspiracy.
7416. Coming to the cost of the works;—do you recollect this report being sent to the Secretary for Public Works? Quite well.
7417. Did you understand that Carter, Gummow, & Co. were substituting a plan of their own, and that the work under that plan was being paid for at 28½ per cent. reduced price? Perhaps I had better explain how that arose.
7418. What did you think at the time? I understood that Carter, Gummow, & Co.'s price at schedule rates ran out at £15,725.
7419. Upon the original design? I did not see it.
7420. Was it not submitted with the tenders? I dare say it was.
7421. Were you not Chairman of the Board of Reference? Yes.

J. Barling.  
6 July, 1896.

7422.

J. Barling. 7422. And were the designs not put before you? I am not certain on that point. I do not think these designs were. I should like to explain what is done at the Board of Reference. Each member of the Board brings his tenders to the Board, and the head of the branch who is responsible for the work says, "There are so many tenders, and such-and-such a firm are the lowest tenderers. The tender is so much." If it be in proper form, and if it be under the estimated cost, then it is passed by the Board. It is utterly impossible for the Board to go into all these details. Each member of the Board has his own work to perform, and it would occupy ten times the time now occupied to go into such details. When the head of the Department therefore explains that the matter is all in proper form nothing further is done. In this particular case I remember quite well the work coming before the Board of Reference. Mr. Hickson informed the Board that Messrs. Carter, Gummow, & Co., were the lowest tenderers, but that they had sent in a special tender for the work upon the Monier arch principle. He said he thought that, as they were the lowest tenderers, it would be a desirable thing to accept their tender, and that it would be a favourable opportunity to give this particular patent a trial. I remember quite well—and I think Mr. Deane will bear out what I say—that I said, "This is a question upon which neither Mr. Vernon nor I can possibly advise. It is a purely technical matter which I do not understand, and which Mr. Vernon also will probably not understand." Mr. Hickson thereupon explained that he and Mr. Darley had carefully gone into the plans and specifications, and also the cost, and that they were prepared to recommend that this particular system should be tried. Upon that explanation the Board unanimously came to the conclusion that it would be perfectly safe to try the work. It is the custom of the Board of Reference when any critical point arises as to the meaning of any specification or any particular feature in connection with a contract, or anything connected with engineering, to refer it to a sub-committee of the Board, who are specially acquainted with the subject, for their advice; and, although at this particular time no sub-committee was actually appointed, we had practically the same thing, because Mr. Hickson reported—and Mr. Darley was present at the time—that they had gone into the matter. The Board, on the recommendation of these two gentlemen, recommended that the principle be tried. It would have been of no use to submit the designs to me. I am not an engineer, and even if I were I should not have had time to go into them.

7422½. Was the plan of the Monier design before you the only plan that was shown to you? I cannot say.

7423. Had you ever seen that plan before? I do not think so.

7424. Have you seen the other plans of Contract 77? I do not think so. It is not customary for me to go into plans at all. Even if I were an engineer, I could not, as Under Secretary for Public Works, go into them.

7425. Did it not occur to you that in a work of this nature detailed quantities should be put before the Board? I do not think so. It would be impossible for the Board to go into such details.

7426. Supposing when the quantities were taken out and the price reduced by 28½ per cent. it showed a difference as between the two designs of £4,125, what would you have said? I should have said that it would be perfectly outrageous to accept the tender. If it were shown that the adoption of this Monier principle would mean a saving to the contractors of £4,125, I should say that it would be perfectly outrageous for anyone to recommend it. I do not believe for a moment that Mr. Hickson or Mr. Darley in their wildest dreams could have imagined such a thing.

7427. If this Monier plan, made by an officer of the Department, were submitted by the contractors as a substitute for the office design, do you not think that it would be a proper thing for the officer in charge to have taken out the quantities in order to ascertain what the real value of the lump sum undertaking on the part of the contractors was? I was perfectly unacquainted with the fact that an officer of the Department did prepare a plan for the contractors. I was very much astonished to see that evidence had been given that any officer of the Department had made this plan. I did not know it, and I certainly do not think that any member of the Board of Reference knew it. As to the main question of whether the relative values should not have been tested, I imagine that that was gone into.

7428. On the 3rd April, 1893, this letter was sent to the Department:—

"I have the honor to direct your attention to a patent, No. 4,084, issued on 3rd November, 1892, to Messrs. Carter, Snodgrass, and Baltzer, for the purpose of strengthening, and at the same time cheapening, the construction of sewer and other arches, as described in such patent as "invention of improvements" in concrete, cement, and mortar, building, and other constructions and manufactures.

I am desired by my clients to state that they are willing to dispose of their sole powers and rights granted in such patent, and to offer the same to your Department for the sum of £1,500."

Do you recollect that letter? Yes, now that my attention is drawn to it.

7429. Did you know that one of the patentees named here, Mr. Baltzer, was an officer in your Department? If I did, it entirely escaped my memory. But for your mentioning it now I should have forgotten all about it; but I do remember the circumstance now.

7430. Did you notice it at that time? I do not remember having done so.

7431. Would it not have been a better transaction to accept that offer of £1,500 than to induce the Minister to utilise this patent on our public works, paying 15 per cent. royalty on it? If it were found that the system were a desirable one to adopt in connection with bridges, it would be better, I suppose, to purchase it at £1,500.

7432. When papers are made up for Parliamentary returns, are not all the papers bearing upon the subject put into those returns? They ought to be. If papers in connection with a particular contract are asked for, of course all the papers bearing upon it ought to be printed.

7433. Could you tell me who made up these papers to be put before Parliament? Those engaged upon the work were Mr. Davis and Mr. Hungerford, I think. Eventually, the matter went to the chief clerk, Mr. John Portus, and I gave him particular instructions to see that every paper was submitted. I should be glad if I might be permitted to make an explanation in connection with these papers. A charge has been made in connection with these papers which were laid before Parliament that certain papers were kept back. I was never more astonished in my life than when I heard that that charge had been made. It must be understood that as Under Secretary for Public Works—as head of the Department—I could not go into all these details myself. It would mean a couple of days of hard work—the checking of all these papers. I gave most positive instructions that the utmost care should be taken to see that every paper bearing upon the subject was placed upon the Table of the House. Mr. Parkes in his speech, if I remember rightly, made the statement that he had asked for these papers two months before they were laid upon the Table. I think the papers themselves,

as

J. Barling.  
6 July, 1896.

as printed, quite disprove that, because on reference to them you will see that the return is to an Order of the Legislative Assembly of the 10th October, 1895. It will be observed that the papers were laid upon the Table of the House on the 22nd October, twelve days afterwards. I question whether, in any case, such voluminous papers were so quickly laid upon the Table of the House. Mr. Parkes also complained, I believe, that a great deal of padding has been put into these papers. The explanation of that is perfectly plain. It would have been impossible for us to have had these papers copied and laid upon the Table in anything like reasonable time. The Secretary for Public Works and I myself were extremely anxious that no charge should lie against us of endeavouring to keep these papers back, and in order to obey the order of the House as soon as possible, we laid the original papers upon the Table. We were anxious that no avoidable delay should take place, and, therefore, all the original papers were laid upon the Table. That is why they are printed in the form in which you see them. It was considered far more important that the order of the House should be quickly complied with, even if some unnecessary papers were printed, than that the usual time should be taken up in copying them. If any papers are missing, all that I can say is that they were not withheld to my knowledge, and I think it would be well if the clerk who had to do with the preparation of the papers were called before the Commission and were asked what instructions I gave him.

7434. The whole of the transactions in the acceptance of this tender do not appear from these papers; several important documents are missing from them? I can quite understand why that should be so, because some of the papers would not be under the heading of the contract.

7435. But I suppose there would be a portfolio for the papers connected with Contract 77, and surely all the papers in that portfolio ought to have been placed upon the Table? I am not aware that any were left out. If any were omitted, it was not done with my knowledge.

7436. Mr. Carter, on July 2nd, 1894, wrote a letter in which he said:—"Referring to our conversation *re* the use of our patent system of bridge and culvert building, we hereby inform you that the royalty we require for the use of the same by your Department will be 15 per cent. on the cost of construction";—Mr. Hickson had then tried the patent in connection with a little culvert 5 feet by 55 feet on the Parramatta Road, had he not? I remember his saying that he had done so.

7437. According to Mr. W. A. Smith, only one-half of the culvert was completed when Mr. Hickson wrote this letter to the Secretary for Public Works:—"The Monier system of concrete arching has been patented in the Colony by Messrs. Carter & Co. Where applicable, it reduces the cost of spanning an opening by about 50 per cent. The patentees are willing to allow the Department to use the patent on payment of a royalty of 15 per cent. on the cost of the arch. I recommend this for the Minister's approval. I might state, I have just completed, with the permission of the patentees, a culvert on the Parramatta Road built on this principle, with most satisfactory results financially and otherwise;"—do you think that the building of that culvert was sufficient justification for the Minister entering into an undertaking like this? I do not think it was sufficient standing alone, but Mr. Hickson explained, when recommending the patent, that it had been tried in Europe and elsewhere. I remember his showing either to the Tender Board or to myself—I think it was to the Board—a number of photographs of bridges of considerable size in the construction of which the principle had been used with great success. As to one of your preceding questions, I can quite understand how it was that Mr. Hickson was not prepared to recommend the purchase of the patent for £1,500 then, but subsequent information may have convinced him that it was a desirable thing to try.

7438. But why not have purchased it at that time? It was not offered then.

7439. It was offered twelve months before, and the offer was not withdrawn? That I do not know.

7440. If there were in the case of the culvert referred to a saving of 50 per cent. upon the ordinary design can you understand how it is that the arches substituted for the office design in the aqueducts at White's Creek and Johnstone's Creek would be almost equal in cost to that of the office plan? I believe they were not quite equal to the cost of the office plan. I think Mr. Hickson explained that. There did appear to be a discrepancy, and Mr. Young spoke to me about it—in fact it was clear on the face of the thing. Mr. Young said he had been told that the adoption of this principle would be the means of saving a large percentage upon the expenditure upon works of that kind, and he wanted to know how it was that such a small saving was estimated in connection with this particular work. I remember asking Mr. Hickson about it myself, and telling him that there did appear, upon the face of the thing, to be a considerable discrepancy. I remember asking him how it was that the saving was so small in the case of this particular work. The explanation Mr. Hickson gave me was this: that as this was the first time the principle was to be tried in a large contract it was desirable to take every precaution. He did not think it advisable to carry it out in the same way that it might be carried out in a much less expensive work. He suggested that the work should be made very much stronger, so that there might be no risk, especially in connection with a large work of this kind. If, he said, the experiment were successful, then we should be able to carry out the principle in other works, with the result that there would be a large saving in the public expenditure.

7441. But does it not look rather like testing the patent of a private individual at the expense of the country? If the work is made perfectly safe I do not think that can be said to be the case. It must be remembered that a heavy guarantee was to be taken from the contractors. Remember these are engineering matters into which I cannot enter.

7442. But when any person submits a patent to the Government ought he not to be made to first prove it at his own expense? To a certain extent the contractors were made to prove it at their own expense, because if the work failed in any way they were held responsible for it. The contractors guaranteed to maintain the work for three years. If I remember rightly, there was the guarantee of Carter & Co. for £12,000, and two separate sureties of £6,000 each. I may mention that the explanation of Mr. Hickson satisfied me, and I think it also satisfied the Minister, Mr. Young.

7443. Suppose it had been proved that No. 77 design was, as regards a great extent of it, the most costly work in aqueduct construction which the Department had carried out, do you not think that in accepting the Monier work at a figure equal to the figure for the Departmental design a rather extraordinary course was taken;—having regard to the risk, would it not be still more costly than the original plan? I should hardly think that, because if it should turn out that this Monier arch system is a success, it will eventually mean a great saving to the Department. That being so, I think the Department might readily take some small risk—and the risk, I think, was very small indeed—by allowing this patent to be tried, because I notice

J. Barling. notice that Mr. Darley, whose opinion I should accept as equal to that of any man in the country, said that in the Monier plan he had a work which was £257 cheaper, and which was, if anything, a better work than that on the original plan?

6 July, 1896.

7444. In this Monier work of course the whole of the contract is not aqueduct. There is a certain quantity of the work which is tunneling. Then there are the foundations of ordinary concrete to be considered. Can you understand why the Government should pay for that work which is not connected with the Monier principle at a price  $28\frac{1}{2}$  per cent. in excess of that for which contractors would undertake to carry out the work? That cannot possibly be the case.

7445. Let me refer you to the schedule of the Department? After all, these are questions which should be asked of an engineer.

7446. But would you have taken the course which you took in submitting this matter to the Minister had you known that what I now state were the facts? I had not divided the work up as between the Monier principle and the original plan; but if, as a matter of fact, the work could have been done at  $28\frac{1}{2}$  per cent. cheaper than the price at which the contract was accepted then it certainly ought not to have been taken at the price at which it was taken.

7447. Looking at the matter from a business and not from a professional point of view, I suppose that in case of a lump-sum contract the obligation on the part of the Government to pay for extras ought to be left out of it? No extras ought to be paid for except in respect of something completely outside of the undertaking; but I can quite understand a lump-sum contract being accepted, and there being at the same time a certain sum to be paid for extras.

7448. If the specification in the contract gives the contractors power to obtain extras there can be no doubt that if the lump sum were exceeded, and the contractors went to law upon the question, they could obtain the extras? They would not be entitled to any extras whatever for any work covered by the lump sum. If, for instance, the contract showed that concrete of a certain richness was to be put in, and if concrete of a higher quality were afterwards substituted, then in such a case of course extras would have to be paid in respect of that substitution.

7449. Provided that the contract specification allowed of the contractors receiving extras, the Government could not prevent the contractors from obtaining them? I think that is manifest.

7450. *His Honor.*] Have you had much experience in connection with lump-sum contracts? Yes, we have often had them; sometimes, for instance, a contract would be accepted in this way—the Department would have the alternative of accepting the contract at schedule prices or at lump sum. If, under such circumstances, a lump-sum tender were accepted the contractor would not be entitled to any extras whatever.

7451. *Mr. Parkes.*] Would you bind them down? They would be bound to do the work according to the specification.

7452. Does your contract in this case stipulate that there are to be no extras? The form of contract would show that. The contractors have to do the work as prescribed in certain plans and specifications for £15,500, no matter what the cost to them may be. If we accepted a tender for a lump sum that would cover all possible contingencies upon the work as shown upon the plans and specifications; but if, as I said before, concrete of a certain richness were mentioned in the specification, and the Department afterwards called upon the contractors to put in concrete of a higher quality, then extras would be paid in respect of that work. I am speaking now in general terms.

7453. *His Honor.*] Is there not always a qualification, as to the quantities, in all your advertisements? Take a case of this kind: Suppose the contractor were driving piles, and that a pile were shown to be broken; if it were a lump-sum contract the contractor would have to drive the pile as far as it would be necessary to go to reach a sound bottom; but, as I have explained, I do not go into these questions at all.

7454. In point of fact, in every one of your contracts is there not a condition that the Department shall not be bound by the accuracy of the quantities represented? There is something to that effect.

7455. And in a lump-sum contract the contractor takes the risk of that? Undoubtedly.

7456. *Mr. Parkes.*] As to these sureties, can you tell us of any other case where contractors have been taken as sureties for a certain contract when they have had business relations with the contractors prior to that date;—can you give us an instance? I cannot at this moment; but I quite agree with a remark which I saw from the newspapers that Mr. Darley had made that, in dealing with contractors, we should think a good deal more of the contractors than the sureties—that is to say, that if the Department is dealing with contractors of good standing it should not be so particular about the sureties.

7457. Not in a special case like this? This, of course, is a special case; but Messrs. Carter, Gummow, & Co. were contractors of very high repute in the Department. In saying that I do not wish to single them out from others whom I could name, because I could mention others equally reputable with Messrs. Carter, Gummow, & Co.

7458. Is not contracting a very precarious game? To the contractors; but I question whether in many cases it is a very risky thing to the Government. In ordinary sewerage contracts there is very little risk.

7459. In any case of this kind have you ever sent questions on to the Crown Solicitor connected with sureties and bonds? The Department has not sent directly to the Crown Solicitor. It has a bond clerk who is in constant touch with that gentleman. His instructions are that if there be anything outside the ordinary transaction he is to consult the Crown Solicitor. Mr. Norrie is in constant communication with the Crown Solicitor upon these points.

7460. Was the Crown Solicitor consulted in this case? That I do not know. I cannot say.

7461. *Mr. Smith.*] In this case there was no special point arising which would require Mr. Norrie to consult the Crown Solicitor? I do not think so.

7462. He was merely instructed to prepare the bonds in the ordinary way? Yes.

7463. As to these papers, I think you told His Honor that you instructed three officers to prepare them in pursuance of the order of the Legislative Assembly? I do not think I said I instructed three officers. I think I said there were three engaged upon the work; but I remember instructing the Chief Clerk to be very careful that every paper was put in which was connected with the contract.

7464. For aught you knew any paper which had any bearing upon any of the contracts was put in? Yes.

7465. There was no attempt to keep anything back, as far as you knew? No.

7466. With reference to the first letter, which we are told was not in the Parliamentary papers—I mean the letter dated 2nd July, 1894;—do you notice how it is headed? Yes—Roads and Bridges and Sewerage Branch.

7467.

7467. Is it at all likely that that paper may have been with the Roads and Bridges Department? It would be, I should say.

7468. As to the minute paper dated 18th July, headed in the same way, would not the same observation apply to that? Yes.

7469. And with regard to the minute of 9th September—Mr. Griffith's letter—that is headed "Metropolitan Sewerage Construction"? Yes, that would probably be there.

7470. These three papers, therefore, were probably not with the other papers? It is highly probable that they were not, although I cannot say for certain.

7471. At all events, you gave instructions that the utmost care should be used in the preparation of these papers for Parliament, and if anyone has told the Legislative Assembly and the public that in preparing these papers there was a glaring attempt to deceive the House, that is absolutely untrue? Absolutely untrue.

7472. *His Honor.*] Would not the heading "Contract 77," if it appeared in large lettering, as it appears here, on the original papers, almost ensure their being among the papers connected with Contract 77? The papers with the Water and Sewerage Construction Branch would be at the Water and Sewerage Board's offices. At the same time, it is quite possible that, owing to the hurry in which the return was prepared, some papers may have escaped attention.

7473. Where would be the main papers in connection with Contract 77? I am not quite certain; I cannot tell.

7474. Are the papers, directly or indirectly connected with every contract, always kept together, or do they get distributed? They get distributed very often.

7475. They branch off, I suppose, into different Departments? Yes; I thought it almost a feat to get these papers ready so quickly. It is not improbable that some papers here and there may have been displaced.

7476. I understood you to say that if you had had time to prepare the return more economically you might have cut out some of the papers which were printed? Undoubtedly. But it was considered both by Mr. Young and myself that the great point was to put the papers on the Table of the Legislative Assembly without a moment's delay; consequently the original papers were used. If the papers had had to be copied, and especially if copies of plans had to be included—and it was a question as to whether it was intended to put in the plans—I referred the matter to Mr. Young, and he thought it was not necessary, because it meant such an enormous expense;—if we had complied with the exact terms of the order, and had put in copies of both the papers and plans, it is quite possible that Honorable Members would not have had the papers even now. It is quite certain that copies of the papers and plans could not have been put upon the Table last Session. They could have been put upon the Table only at the commencement of the present Session, and perhaps not even then.

7477. *Mr. Gummow.*] In accepting tenders from firms who had put them in, is it the practice of the Department to accept the firm's name, or the names of the individual parties in the firm? If I remember rightly, the acceptance would be in your case Carter, Gummow, & Co.; but in preparing the bond, it would be Messrs. So-and-so, trading under the name of Carter, Gummow, & Co.

7478. In the case of any dispute arising, whom would you sue or look to on behalf of the contractors? I think the Department would sue the persons named in the contract. It is a question of law, but I think that would be done.

7479. Would you not consider that the parties who signed the bond would be the responsible parties to the Government? Yes.

7480. Do you remember when the plans were put in for Contract 77? I cannot say that I do remember.

7481. Do you know whether they were put in before the tender or not? I cannot say. The Under Secretary would have no time to examine all these matters at the time tenders are received.

7482. Do you remember ever speaking to Mr. Carter about coming in before 11 o'clock to do business with you? I cannot say that I do. It is possible that I may have seen someone before 11 o'clock. If there were any important business to be done I should not have any objection to see a contractor or anyone else before that hour.

7483. As to the tender sent in by Messrs. Carter, Gummow, & Co., do you know how many tenders they sent in for this particular work—for the Monier arch;—you will see the tenders on page 163 of the Parliamentary papers? I may mention that I do not examine the tenders in detail. That is done at the Engineering Branch. I see from the papers that two tenders were received.

7484. One was at 28½ per cent. below schedule rates, and the other was for a lump sum of £15,500? Yes.

7485. In your opinion, have those tenders any connection—the one at 28½ per cent. below schedule rates and the lump sum tender of £15,500? I think not.

7486. Do you think that the Engineer-in-Chief would connect them in any way? I should hardly think so. I should think the 28½ per cent. tender would be to guide him in a comparison between the lump sum tender and the schedule rate tender.

7487. They would be treated separately—they would not be combined in such a way as to make one tender out of the two? No.

7488. The Department would accept either the one or the other? Yes; certainly.

7489. As to contractors' work, you said that it was rather precarious;—do you think it is precarious to good men who understand their work thoroughly? What I said was that it might be precarious as far as the contractors were concerned, but that there was not much risk so far as the Government were concerned. What I meant was this—that the contractors might have to contend with fluctuations in the prices of labour and material—that they would have to take that risk—whereas the Government would have no risk.

7490. But do not other persons in business have that risk to contend with? Certainly.

7491. Do you think there is any greater degree of insecurity in the case of contractors than in the case of any other business, supposing that there are equally good men in either case? I can quite understand that some contracts would be eminently risky for the contractors. Such, for instance, as those where the element of the sea would come in. Take harbour works, for instance. They might be very risky.

7492. Take a case in which two experienced men carried out the work personally? I should not think there would be much risk in the case of sewerage works as far as the works themselves are concerned. Of course, there may be the risk of rise in prices.

7493.

J. Barling.  
6 July, 1896.

- J. Barling. 7493. In the case of men who have carried out such works as the Bondi and Rushcutter's Bay would there be much risk? Not as regards the carrying out of the work itself; but there might be from the rise of prices.  
6 July, 1896.
7494. But that risk would affect any one? Yes.
7495. *His Honor.*] As to the question of whether the department has formerly been in the habit of accepting lump-sum contracts,—what have you to say as to that? Sometimes tenders have been submitted at a lump sum.
7496. But in those cases were lump-sum tenders called for? Speaking from memory, I think there are cases where there was an alternative put before the contractors, and where the Government could accept tenders either at lump sum or at schedule prices. There would, however, be no difficulty in obtaining the fullest information upon that point. I am speaking now from memory.
7497. Has it ever been the practice to accept lump-sum tenders where tenders had been called for generally at schedule rates? No. In such a case tenders would be generally accepted at schedule rates.
7498. Do you know whether a lump-sum offer was made in any former case where tenders were called for at schedule rates? I do not remember a case at this moment. I should think it possible that it may have been so; but for the moment I cannot recollect any particular case.

James Henry Young, sworn and examined:—

- J. H. Young. 7499. *Mr. Parkes.*] You are Secretary for Public Works? I am.  
6 July, 1896.
7500. You recollect Mr. Hickson forwarding to you a report in which he stated that he found the Monier patent arch 50 per cent. cheaper than the ordinary design of the department? Yes. [*Vide Appendix No. 10.*]
7501. What did you understand from that? I understood that if we adopted the Monier arch at places where it could be utilised, the expense of the work would be reduced by that amount.
7502. That is why you accepted the offer of Messrs. Carter, Gummow, & Co. to do this work, and to receive 15 per cent. royalty? That is not at all the reason why I accepted Messrs. Carter, Gummow, & Co.'s tender to do the work. The one thing had nothing to do with the other.
7503. When you accepted the other, did you not understand that it would be equally cheap if it were applied in any position in arches? In any position in which it might be suitable. What I mean to say is, that the one thing had no bearing on the other. In the one case there was a distinct offer quite independently of the former proposal that we should pay something in the nature of a royalty upon the arch.
7504. Mr. Hickson's minute says, "Where applicable, it reduces the cost of spanning an opening by about 50 per cent.";—I suppose you would take that to be wherever it was used in an arch? Wherever we thought it justifiable to use it.
7505. On the second occasion, when the tenders for Contract No. 77 were submitted to you with the Monier arch design substituted, you wrote this minute to Mr. Hickson, "Before approving of this proposal, I should like an estimate of the actual value of the work to be carried out by the contractors under the substituted scheme"? At that time I did not know the quantity of the Monier arch to be used. I did not know how much Monier arch work there would be in the whole contract.
7506. What was your object? My object was this—that however satisfactory the Monier arch system might be represented to me to be, I would not have accepted the tender without putting up the specification under the system for public competition, unless it had been reported to me that the actual work to be carried out under the system approached very closely to the departmental estimate for the contract.
7507. If you had known at the time that the work for which the Monier system was to be substituted was the most expensive aqueduct work the office had carried out, would you have accepted the substituted value? I could not tell you that.
7508. If you look at page 6 of the Parliamentary Papers ordered to be printed on 9th October, 1895, you will see the following minute by Mr. Hickson:—
- To comply fully with the Minister's minute would mean the taking out of quantities in the plan submitted by Messrs. Carter and Gummow. This would take at least a week to do. I think, however, I can answer sufficiently for the Minister to come to a decision. When plans were being prepared for the extension of the sewers on to the sewage farm, estimates were made for the work on the Monier system, as well as on the Department's designs. The result was that the estimate of both works was practically the same. Applying that comparison to this case, it would mean that the Departmental estimate for the work under consideration would be £22,000.
- Supposing the work in the outfall sewer construction were to a great extent cheaper than the original design for Contract No. 77, would you then have accepted the Monier system as a substitute at the same price? I cannot say that I should. I can only make my position clear. The reason why I did it was that it was reported to me that the cost under the Monier arch system would be practically the same as under the departmental plan.
7509. Have you seen the departmental plans before? I do not think so.
7510. They were not submitted to you? I think not.
7511. You have some knowledge of building;—look at these plans and you will see the nature of the construction;—the arches and the facings are all of brick;—you will see that the cornices are of stone;—then there is the ellipse arch to be considered;—you will see that the sewer is bedded in concrete;—not only are the piers solid, but there is a considerable difference in the number of piers in the two designs;—have you not seen those plans of the original design before? No.
7512. If you look now at the Monier arch design, in which a three to one compo. is used, you will see that there is a less number of piers, and that they are all plain cement work;—if you had seen that plan before, would you have been disposed to accept it as an equivalent in value to the other plan? I could not tell you. I do not know the value of compo. work, nor the actual cost of brickwork. It is utterly unnecessary that I should know, so far as I understand the duties of my position.
7513. If you had seen these plans would you not have insisted upon an estimate of the two values being made? It is possible that I might have done so, but I do not think so. Mr. Hickson, the Engineer-in-Chief, was appointed to his position to advise me in all matters in engineering? Moreover, the plans were submitted to the Board of Reference, consisting of all the principal engineers in my Department, and I could not take it upon myself as a layman to refute the statements made by them.

7514. As a Minister you feel that you are compelled to rely absolutely upon those officers? The Minister is not absolutely compelled to do so, but the work he has to do makes it almost necessary that he should, unless he has strong reasons for doubting the *bona-fides* of his officers. J. H. Young.

7515. In all these professional matters the Minister can only arrive at a decision upon the reports which come to him from the heads of particular Departments? Practically that is so, when it comes to a question of engineering. 6 July, 1896.

7516. If these officers misled the Minister, no blame would attach to him? I should think not.

7517. On 5th April, 1895, Mr. Hickson wrote as follows:—

Messrs. Carter and Gummow ask that their own "personal sureties for the amount named," *i.e.*, £12,000 (an amount which they do not dispute), "should be taken for its completion and maintenance, and as a sufficient guarantee for the proper carrying out of the work."

They go on to say that they are "a firm of sound financial standing, well and favourably known to the Department as contractors." This is quite true. They are a firm in which I have every confidence. They have done a great deal of work under me, and I can testify that their aim always has been to turn out the very best class of work possible. At the same time, misfortunes happen the very soundest firms of contractors, and the Department must look a little way into the future. Their own bond for £12,000 would be really of no use if they were unfortunate enough in the meantime to become bankrupt.

I think, therefore, it is right that the sureties should be insisted upon. They give the names of two men, Mr. George Forrest and Mr. James Gillan. From inquiries made, I believe these men to be financially sound, and I think if their names were accepted as the sureties in the penal sum of £6,000 each, the Department would be secured as far as it is reasonably possible to be.

I suppose you recollect that report. When you received it, did you think that Mr. George Forrest and Mr. James Gillan were absolutely independent of the contracting firm? Yes. I did not think they were parties to the contract in any way—in so far as I thought about the matter at all; but in these matters, as in engineering matters, I am to a large extent—to a very large extent—guided by the actions of my officers.

7518. If you had known that Mr. George Forrest and Mr. James Gillan were connected with the firm of Carter, Gummow & Co. and Carter & Co., would you have accepted them as sureties? I am sure I should not.

7519. Did you understand from the letter from which I have quoted, that Mr. Hickson had made special inquiries to ascertain whether these two gentlemen were worth £6,000 each? I understood that he had made full inquiries, but whether they were special inquiries or not, of course I did not know. That was a matter quite within Mr. Hickson's own knowledge.

7520. Did you have any conversation with Mr. Hickson upon this matter? Certainly not upon the question of sureties.

7521. Had you any conversation with him as to the acceptance of the Monier plan in substitution for the original Departmental design? I may say that before the tenders were sent in at all I had an interview with, I think, Mr. E. M. Clark, and either Mr. Carter or Mr. Gummow—one or other of them—when they asked me if it would be of any use for them to send in a substituted tender upon the Monier system. I did not commit myself to anything in reply except this, that there would be no harm in their sending it in. I did not pledge myself in any way, nor did I in any way lead them to suppose that the design would be considered. The understanding was that it might be sent in for whatever it was worth. I do not remember speaking to Mr. Hickson on the subject at all; everything was done through Mr. Barling. He was my Under Secretary, and, as a rule, all my conversations were with him. I could not say absolutely that I did not converse with Mr. Hickson upon the matter, but I do not remember it.

7522. You do not remember any conversation on the subject with him at all? No.

7523. I suppose the statutory declarations attached to the bond would not be put before you? They never come before me at all.

7524. Your position in this matter has been one of absolute guidance by your Departmental heads? Excepting that, as my minute shows, I looked a little more closely into it when I asked for a further report as to the value of the work. It shows that I did not act without inquiry. All my action was taken on the reports made by my officers.

7525. If the Monier work were not of the value of the office work, you were deceived by the minute which was sent to you on the 28th March? If that be so, no doubt it was a misleading minute. I am not prepared to say that it was. I do not know of my own knowledge whether it was so or not.

7526. Did you ever see Mr. Carter with Mr. E. M. Clark on any former occasion? I think this was the only time I ever saw him.

7527. Were you ever asked by Mr. E. M. Clark for an extension of a contract of Messrs. Carter, Gummow, & Co.? Not that I remember, but anything I may have done in that direction was not done upon Mr. E. M. Clark or Mr. Carter asking me to do so. I remember, however, giving them an extension of a contract without tender. It was represented to me, I think, that it would save the expense of an extra shaft—that, on the whole, there would be a considerable saving.

7528. Was that the work in High-street, North Sydney? Yes. It was a small contract at North Sydney, I think.

7529. Do you remember the reasons which were given for the acceptance of the offer? They all appear in the papers, I presume.

7530. Was there no conversation on the subject? Not between myself and Mr. Carter and Mr. E. M. Clark. There may have been some conversations between myself and my officers—either Mr. Hickson or Mr. Barling.

7531. Had you any conversation with Mr. Hickson when you agreed to the acceptance of the Monier patent and the payment of 15 per cent. royalty upon it? I do not remember it. I presume the matter would come before me through the Under Secretary in the ordinary way.

7532. Do you remember a test of the Monier system being made in connection with a culvert, 5 feet wide and 55 feet long? I do not know that that test was spoken of precisely.

7533. How long before the recommendation was made to you did you understand that that culvert was constructed? I really cannot remember. I think it is about 18 months ago since I accepted the recommendation.

7534. But did you have any conversation with Mr. Hickson about it? I do not remember.

7535. Were there any reports produced to you showing the cost of the culvert upon the two designs? There was no detailed estimate in any way. There was nothing more than is shown by the papers.

J. H. Young. 7536. *Mr. Smith.*] With regard to the acceptance of Mr. Forrest and Mr. Gillan as sureties in connection with this contract, I think you said, in answer to a question by Mr. Parkes, that if you had known that they were connected with the firm of Messrs. Carter, Gummow, & Co., you would not have accepted them? I think it is a condition of all contracts that all the partners of a firm must sign, and that the Department will not take one partner without the others. As the names of these gentlemen did not appear with the others at the foot of the contract, I did not suspect for a moment that they could be in the firm.

e July, 1896.

7537. Suppose they had no interest in this particular contract, would there be any objection to their acceptance as sureties if they were connected with the firm in other contracts? That is a question of law.

7538. But I mean from your point of view? I should not think there would be any objection to them if they were not partners as regards this particular contract.

7539. You said that you acted upon the advice of your responsible officers unless you had some strong reason for doubting the *bona-fides* of these officers? Not only their *bona-fides*, but their general character.

7540. Have you any reason for doubting the *bona-fides* of Mr. Hickson in regard to any of these matters? Not the slightest in regard to this or any other matter which has come before me. I have no reason to doubt his being deserving of the most implicit confidence.

7541. In your minute of the 10th December, 1895, you wrote as follows:—

Mr. Hickson may be informed that the statements to which he refers herein have never had the effect of diminishing the complete confidence I, as Minister, have always had in him in the important office he holds. That I cannot believe they will, in the slightest degree, affect his position with reference to his officers, contractors, or the general public, and that, having consulted the Cabinet as to his request for a commission of inquiry, I am able to state that my colleagues agree with what I have above written. If Mr. Hickson desires to place any rebutting statement before the public, I shall have much pleasure in laying it on the Table of the Assembly.

? Yes. I see that Mr. Hickson had asked at that time that a Royal Commission of Inquiry might be appointed to investigate the statements made by Mr. Parkes.

7542. That was after the first speech made by Mr. Parkes in reference to this matter? Yes. On 21st November Mr. Hickson wrote to that effect. He says, "I would therefore ask the Minister to consider the advisability of having these charges and statements thoroughly investigated by some independent authority, having full power to call witnesses and examine them on oath."

7543. The opinion which you expressed in your minute is the opinion you still entertain of Mr. Hickson? Yes.

7544. And you approved of the statements then made by Mr. Hickson being laid upon the Table of the House? Yes.

7545. If it has been stated that this firm of Messrs. Carter, Gummow, & Co. were connected with the Government in a most suspicious manner, that is absolutely untrue so far as you know? So far as I know.

7546. *Mr. Gummow.*] You mentioned that Mr. E. M. Clark, and either Mr. Carter or Mr. Gummow, called to see you before we put in our tender upon the Monier arch system? Yes.

7547. Did you promise that their tender should be accepted if it were the lowest? No; I said I could not make any promise of the kind.

7548. Can you remember what you said? I should not like to say that I remembered every word; but I can remember the effect of it. I think that what I said was that if they were lowest tenderers, and were therefore entitled to the contract under other circumstances, then, if they submitted a tender for a substituted design, it might be inquired into and reported upon.

7549. With what object? To save money to the Government, and also to give a trial to the Monier arch principle.

7550. In accepting the tender of the firm, was your object to assist the contractors, or did you consider that the country would benefit by the introduction of the new system? Your latter statement covers the only object I had in view. That, as I understood, was the object my officers had in view.

7551. To benefit the country if possible? Yes.

Edward Hungerford sworn and examined:—

E. 7552. *His Honor.*] You have been employed by the Department for some years, I understand? Fourteen years.

Hungerford.

7553. You knew Mr. Baltzer well? Very well.

7554. Are you intimately acquainted with him? Yes, very intimately.

7555. You lodged in the same house? Yes, for some years.

7556. Before he left the Department? Yes; before and after.

7557. I want to know what you knew from Mr. Baltzer as to his preparation of plans, or of a plan, for use by Messrs. Carter, Gummow, & Co., in connection with their lump sum tender for Contract 77? Mr. Baltzer was engaged for some time on those plans. I used to see him at work upon them constantly.

7558. Where was he engaged upon them? At home.

7559. Partly at home and partly in the office, or entirely at home? Entirely at home, so far as I know. I never saw him in the office, so that I cannot speak of what he did there; but we always came over from North Shore in the same boat, and I should certainly have seen him carrying plans. I presume he would not have had one plan at home and another in the office.

7560. Did he carry plans backwards and forwards? He may have done so once or twice, but it was not his custom.

7561. If he carried plans once or twice, do you know whether the plans he then carried were the Monier design plans or any other plans? Other plans I should think, because he was constantly at work on plans.\*

7562. Do you know from Mr. Baltzer how he came to prepare this Monier plan? Yes; in connection with the patenting of the Monier system.

7563. Were the plans to be used with the lump sum tender for Contract 77? He told me he was preparing them for that contract.

7564. At whose request? He never told me that.

7565. He simply said that he was preparing plans? Yes.

7566. You knew from him that these plans were going to be used in some way in relation to Contract 77? Certainly. 7567.

\* NOTE (on revision):—For the office.

E.  
Hungerford.  
6 July, 1896.

7567. Did you know what was going to be done in reference to them? He told me that an alternative tender was going to be put in.
7568. Did he tell you that as a secret, or openly? Quite openly.
7569. Did he ask you to keep it to yourself, or what did he say? He did not ask me to do so.
7570. Was the matter generally known to any other person beside yourself? I could not say.
7571. He made no secret of it? Not to me.
7572. Did you ever hear him speaking to anyone else about it? I could not say whether anyone else was present at the time or not. Probably there was.
7573. Did he say at whose request he was preparing these plans at any time? No.
7574. You knew that Messrs. Carter, Gummow, & Co. were going to tender? Yes, I understood so.
7575. Did you know that they were going to put in a lump sum tender in conformity with the plan which Mr. Baltzer was preparing? I could not say that I knew that they were going to tender at a lump sum. All that I knew was that the plans were for an alternative tender.
7576. By Messrs. Carter, Gummow, & Co.? Yes.
7577. Did you know at that time that they had the patent? Yes, in conjunction with Mr. Baltzer.
7578. *Mr. Smith.*] Had you anything to do with the preparation of the papers for printing in pursuance of the order of the Legislative Assembly? Yes.
7579. Who worked with you in their preparation? No one.
7580. Were you the only officer engaged in their preparation? I and Mr. Davis. We asked Mr. Norrie's advice on one or two occasions.
7581. You prepared the papers for Parliament in the ordinary way? Certainly.
7582. You are continually having to do such work? Very frequently.
7583. Was there any exception made in this instance? No.
7584. You prepared all the papers which you could find which you thought ought to be printed? Certainly. There was no intention of keeping back anything. Nothing was kept back.
7585. As far as you know nothing was kept back? No.
7586. If it should turn out that any papers were omitted those papers would not have been in this department? No.
7587. *Mr. Parkes.*] Do you keep all the papers in connection with particular contracts in portfolios similar to those which you see on the table? We used to.
7588. They were always kept in that way? Yes.
7589. At the time this return was made up were they kept in that way? Yes.
7590. Therefore, any papers in the portfolios ought to have been with the papers which were laid upon the table of the House? Not necessarily.
7591. You selected the papers for the House? Yes; the only things taken out were some minor matters such as papers having reference to requests for a day's leave of absence—papers which were utterly immaterial.
7592. You selected from the papers those which were laid before Parliament? Yes.
7593. Supposing there were a letter from a Member of Parliament asking that a particular contract might be given to a firm without tender, that would be put in one of the portfolios? Yes.
7594. If it were in one of the portfolios, ought it not to have been picked out for submission to Parliament? If it were there.
7595. Take the paper showing that Mr. Young had authorised the payment of a royalty in respect of the Monier arch;—would not that have been among the papers? No.
7596. How would it appear among the papers ultimately? I think, as far as I remember, we put that paper in as having some bearing on the case—that is, upon one of the contracts of Carter, Gummow, & Co.,—as showing how the Monier system may have been introduced.
7597. Would it not be kept with the other papers? No. It had nothing to do with any of their contracts.
7598. Did you not select the papers from the portfolios? Yes.
7599. And some you rejected, while others you selected? I did not reject any of importance. We took the papers from the portfolios.
7600. But you did not lay all the papers in the portfolios on the Table of the House? Not papers, where for instance, an inspector would ask for a day's leave of absence.
7601. You eliminated some of the papers? Yes, certainly.
7602. *His Honor.*] Do you know whether the papers having reference to the introduction of the Monier system which have been referred to to-day—the letter of Mr. Hickson, for instance, of the 18th July, and the letter of Mr. Carter, of the 2nd July, and also the letter of Mr. Griffith, asking for approval of the new schedule for the making of progress payments on Contract 77,—were eliminated? They would not have been eliminated if they had been there at the time. No papers which had any connection with the contracts were eliminated.
7603. You are sure they were not eliminated? I am sure they were not. If they were there, they would certainly have been printed. It was about this time that Mr. Parkes' question was answered, and the papers may not have come in then.
7604. The letter of Mr. Griffith, for instance, has been registered? Yes. It was registered at the Water Supply and Sewerage Board. You will see their stamp on it.
7605. Would that indicate that it might not have been among the papers at the time you made up the Parliamentary return? We may not have known anything about it. It may never have been in the office at all; it probably would not have been.
7606. *Mr. Smith.*] It was minuted on to Mr. Adams, the clerk to Mr. Darley, on 12th September, and it was signed by Mr. Adams, showing that he had sent a copy on to the Engineer-in-Chief on 30th September—That would show that the paper was in that Department up till September 30th? Yes.
7607. The probability is that it was floating about there after that? Yes.
7608. This other minute of 18th July has nothing to do with sewerage contracts—it is a Roads and Bridges matter? Yes. Of course there may have been a few papers omitted, but there were not instructions to omit any.
7609. You exercised all the care you could in making up the return? Yes; speaking from memory, I was about three weeks in the room by myself with all the papers relating to the contracts. Mr. Davis used occasionally to come in and help me.

WEDNESDAY, 8 JULY, 1896.

John Carter, recalled and further examined:—

- J. Carter. 7610. *Mr. Parkes.*] You managed the whole of the financial business of Carter, Gummow, & Co.? Yes, pretty well.
- 8 July, 1896. 7611. On 1st July, 1892, on 1st September, on the 1st November, and on 30th December, Government cheques paid to H. Rudolph were handed to you and paid into the Bank of New Zealand;—did those cheques represent his salary? Yes, I believe so. I do not remember the dates upon which the transactions occurred.
7612. How came the transactions to occur at all? They were private matters between Mr. Rudolph and myself.
7613. Did you lend him money? I did.
7614. And he repaid you in this way? Practically he did. He may have repaid me some balance in cash.
7615. On April 19th, 1892, you drew a cheque in favour of Henry Rudolph for £250? I believe so.
7616. Was that the same Mr. Rudolph? Yes.
7617. Was he an inspector? No; resident engineer.
7618. For what district? He had no district as far as I am aware.
7619. Was this cheque for money lent to him? It was money I was lending to him.
7620. On May 26th, 1894, another cheque was drawn in his favour for £40;—does that also represent money lent to him? I have not a clear recollection of that, but I should say that it would be so—in fact I think I can say for certain that it was. It could not have been for any other purpose as far as I know.
7621. Do you know an inspector named O'Hanlon? No. I knew an engineer of that name.
7622. Was he resident engineer on some of these contracts? Yes.
7623. What was his full name? Charles Unthank.
7624. Had you any transactions with O'Hanlon? I had.
7625. Did you pay him on July 6th, 1894, the sum of £145? It is very probable that I did.
7626. And £150 on July 26th, 1894? Yes.
7627. £60 on April 30th, 1894? Possibly.
7628. On September 6th, 1894, £60 in cash? Yes.
7629. Were these amounts loans also to resident engineer O'Hanlon? They were.
7630. In connection with any particular transaction? Yes. I will give you an explanation later on as to the whole of these transactions.
7631. On June 18th, 1895, a Mr. S. H. Wheedon was also resident engineer? Yes, but not in the Sewerage Department.
7632. *His Honor.*] In what Department would he be? I think, in the Country Towns Water Supply Branch.
7633. *Mr. Parkes.*] He had formerly been a resident engineer in the Sewerage Department? Yes.
7634. Did he pay into the account of Carter, Gummow, & Co., the sum of £2,000 on June 18th, 1895? He did not.
7635. But that sum of money was paid in on that date? Certainly—by me.
7636. Was it not made up of two cheques or of a cheque by Mr. Wheedon? There was one cheque, as far as my recollection goes, for £2,000.
7637. That was paid into Carter, Gummow, & Co.'s account by you, and it had been given to you by Mr. Wheedon? Yes.
7638. Was Mr. Baltzer an officer of the Department? Certainly.
7639. Did he on 31st March, 1896, pay into your account a Government cheque for £159 17s. 5d.? No.
7640. Did he pay it to you? No; it was paid by the Treasury.
7641. But upon his order? Certainly.
7642. What was it for? It was his retiring allowance. It had been owing for some considerable time; I could not say the exact number of months.
7643. Why was it paid into your account? Because I was his agent.
7644. Referring again to the £2,000 paid into your account by Mr. Wheedon;—why was it paid in? It was a private matter between Mr. Wheedon and myself. It had nothing to do with the firm's business.
7645. Was it payment for an interest in your concern as a partner? No.
7646. Could you explain the payment? Yes. The facts are pretty well these. Mr. Wheedon's father died some time ago—I do not know exactly when—and he left him this sum of money. Mr. Wheedon was desirous of investing it, and he consulted me repeatedly during some months as to the purchase of land and the building of a house. I may say that, residing, as I do, at North Shore, I have dealt in land and that kind of thing there for a number of years, and I am looked upon somewhat in the light of an authority upon that subject. Having known Mr. Wheedon very well for a number of years, he very naturally consulted me in the matter. He acted so far upon my advice as to investigate matters in connection with several pieces of land, and to draw out plans for his house, and so on; but, owing to sudden changes in the Works Department, and the insecurity of his position—no Civil Servant felt very happy or secure in his prospects at that time—he decided that he would not go on with his land and building investment. He said, "I want some return, and I think I will put the money out on mortgage. Will you advise me what to do with it?" I looked about and I could not see anything very tangible or anything which could prove very remunerative to Mr. Wheedon. After some weeks had elapsed I said, "If you can get no other investment I will take the money and will give you security for the amount." This was some months after he had received it from his father. After we had gone extensively into the question of building and so forth he handed me the £2,000, and I handed him my security, which he now holds. Those securities were solely my property. That, in brief, is the history of the transaction.
7647. *Mr. Gummow.*] Did you pay any interest upon that advance? Interest at the rate of 6 per cent. was paid, and I received it back from my firm.
7648. What security do you say there was? My own personal property, land at North Shore and various places.
7649. It had nothing to do with the company's property? No.
7650. Was there any other security which you gave in the shape of a bill;—did you hand him a promissory-note? Yes; I did, but I had forgotten that.

J. Carter.  
8 July, 1896.

7651. For what amount was the note? I believe for the full amount of £2,000.
7652. What was the exact property upon which the money was lent? Various blocks of land at North Sydney.
7653. Could you name them? Yes; there was land in Alfred-street, North Sydney.
7654. What are the numbers of the allotments? I could not tell you now.
7655. Would it be the whole of the land you own in Alfred-street? Yes.
7656. Was there any other land there? Yes; land in Hill-street and Miller-street.
7657. Any other? Not that I can think of now, but I will look up the matter and see.
7658. *His Honor.*] Was it a registered mortgage or an equitable mortgage? There was a document, executed by Johnson, Minter, and Simpson, to protect Mr. Wheedon. That was done by his instructions.
7659. *Mr. Parkes.*] There were some cheques paid into your account by the Sydney Mint as follow:—On April 10th, £242; on December 7th, £257; on February 24th, 1896, £304; and on March 25th of the same year, £67. What were these amounts for? Am I supposed to answer these questions, your Honor? These payments had really nothing to do with any of our contracts, or with any Government officer; they were entirely outside transactions. I do not think I should be cross-examined upon every cheque I draw.
7660. *His Honor.*] Have you any objection to answer the question? No; I can answer it in every detail.
7661. Then I think it would be more satisfactory for you to do so? These payments were revenue from, and the sale of, the Post Office gold-mine in Stewart Town.
7662. *Mr. Parkes.*] To whom did you sell that mine? To the company who are working it now.
7663. Of whom did the company consist? I could not tell you; I never saw the men. They have been working the mine for the last two years. It is a company, and that is all I know about it. I had nothing to do with the transaction except to receive the moneys and satisfy the purchasers that the matter was quite correct.
7664. There were some payments made in cash to H. Boehme? That is in connection with the same matter—the Post Office mine.
7665. With reference to the sales of cement made to other contractors, I suppose the cheques paid by Ahearne, Carson, Flood, Flood & Rutherford, Matheson, and Langley, represent sales of cement; I see that Ahearne paid in £276 10s. 8d.,—that is for the purchase of cement, is it not? I could not say at this moment what it was for.
7666. I am referring now to a payment on April 17th, 1895? I lent him some; I do not know that I sold him any. Some was transferred through a merchant to him; but whether he paid us or the merchant I could not say. We had other transactions in plant, metal, and so on, for which he paid me; but whether the cheque refers to that or to the sale of cement, or to the three combined, I could not say.
7667. How much cement did you sell him? I did not sell him any. I do not sell cement. I oblige persons with cement, sometimes, when they are stuck up for it.
7668. *Mr. Carson*, on August 7th, 1894, paid in a cheque for £107 5s. 9d.—that would be for cement? Possibly, for material of some sort.
7669. Then there were cheques by Flood, and Flood and Rutherford, on December 3rd, 1892, for £17 11s. 10d.; on January 10th, for £10; on June 3rd, for £200? I do not think I can answer those questions definitely from memory.
7670. Was not the payment on January 10th, 1892, for cement? Possibly.
7671. Was not there a period when you had all the tested cement, and when all the other contractors had to come to you for it? Not at that time, I think; but the thing occurred last year or the year before last.
7672. Other contractors had to buy off you? No; they borrowed from me. I do not deal in cement.
7673. Did they pay you in cheques or in money? They did both, I think, just as it suited them.
7674. Then there is a cheque by Danaher, Taylor, and Britton, for £300 9s. 9d.? Yes, that was for cement.
7675. And a cheque for £30 by P. H. Osborne, on April 11th, 1896—a cheque on the Commercial Bank—had that anything to do with cement? I do not even remember the cheque.
7676. *Mr. Gummow.*] Do you remember some one coming to you and asking you to exchange a cheque? Yes; I remember now that I did exchange a cheque. I remember now that a man who could not get a cheque cashed came to me and I gave him my cheque in exchange for it, paying the cheque I received from him into my account.
7677. Are your business transactions with Mr. Snodgrass completed;—does he still hold an interest in the business? They are completed. He holds no interest in the business.
7678. When did he leave the firm? At the beginning of the year.
7679. There is a cheque paid into your account by Mr. W. A. Smith of £20 5s.; was it not for cement? I could not tell you. Is it a public officers pay cheque?
7680. Yes. Was not that cement supplied for the culvert on the Parramatta Road? No; I do not think so.
7681. Do you remember whether in 1895 Mr. Smith did get twenty-five casks of cement from you? I think that at that time, if I remember rightly, he was hard up for cement, and like everyone else, he came to Carter & Co.
7682. If the quantity corresponds with the vouchers in the Department in connection with that particular work, would the cement not have been used in that way? The payment could not be for anything else, as far as I know. I have no recollection of the transaction. It was a very small matter, and I did not take particular notice of it.
7683. *His Honor.*] The date given would be sometime after the cement was supplied? Yes. I do not remember the transaction, but I know that Mr. Smith did come and get some tested cement because he was short himself. I may make this remark—that Mr. Parkes asked me the other day whether we ever received any royalty from the use of the Monier patent, and I answered him then as far as I could remember. I am informed that we received £2 5s., but I had no recollection of the circumstance then.
7684. Did you not also receive the sum of £13 8s.? I do not know, speaking from memory. If you could tell me of the occasion I could think of it, perhaps; I know that when I heard of the other amount it came as news to me.
7685. *His Honor.*] Would that payment be in connection with the work at Callan Park? Yes.
7686. *Mr. Parkes.*] You have told His Honor that your firm kept no books? Yes.

7687.

- J. Carter. 7687. Then how would you conduct your business transactions when you bought in cash? We never bought in cash.
- 8 July, 1896. 7688. Never on any occasion? Never, except small amounts.
7689. If you were importing material would you not have to keep books in connection with those transactions? We never import.
7690. I see from the papers in Contract 79 that you were allowed first of all a 2 inch margin and that latterly you were allowed a 3¼ inch margin of cement outside of the actual lining of the sewer? Yes.
7691. Do not you think that you got a good deal of advantage over the Government under that arrangement? No.
7692. Was it not a big margin? It was not big enough, if anything. There was not an ordinary margin to begin with.
7693. Take the average of your blowing out—you would not blow out much beyond 3¼ inches? Yes, we should. I wish we could always keep it down to 3¼ inches.
7694. What would be the average? I could not say. It would be much bigger than that.
7695. Would it be 6 inches? I could not say. I have no practical knowledge of these matters. I know, at the time, I was consulted in reference to this matter, and we looked upon it as a very neat thing. We thought we were being "got at," as it is termed, by the Department.
7696. You had to fill it all in solid with concrete where you had blown out? Yes; no matter whether it was an inch or a foot.
7697. Having regard to the dimensions which were mentioned by Mr. M'Creddie in connection with his inspection, do you not think you were allowed a big margin? You are referring now to another contract.
7698. It was a continuation of the same contract;—was the drive in 79 blown out much more than in 79 A? I could not say. I was never down in the tunnel in my life.
7699. Do you not think that in paying you £1,250 for the substitution of blasting for guttering and gadding the Government got a long way the worst of the bargain? They got a long way the best of us, and I always told them so.
7700. Why had you to put so much concrete there? It was not a question of concrete. It was the question of delay and the extra cost of gadding.
7701. But did you not get an advantage in having 3¼ inches of concrete put in? No advantage.
7702. Would it not be to your advantage if you had been paid up to the full excavation? I could not tell you. I know that it was looked upon at the time as a very neat thing indeed.
7703. You thought the margin should have been much larger than that? Certainly. I should like, before my examination is concluded, to make an explanation as to Rudolph's matter. He is an old personal friend of mine. His wife is a personal friend of my wife. We are very friendly. I think we were the only friends they had in New South Wales at that time. He, being a steady man and anxious to improve his position, purchased a house and land at Marrickville, for which he was promised money by another friend of his—it is a German name, and I forget it. At all events, Mr. Rudolph entered into negotiations, and finally purchased this property. As far as I can remember, when the time came for the money to be paid, it was discovered that his German friend's money was locked up, and that it could not be got at. Mr. Rudolph came to me about it, and, knowing him as I did, I advanced him the sum of £250. I think that was to pay the first instalment—whatever he may have agreed upon as the first instalment—on the building. Mr. Rudolph undertook to pay me back, every succeeding month, the full amount of his salary, whatever it may have been—£32 or so, I think. He did so for some little time, and then he said, "I find I can save more than the £32. I will pay you something in cash." I presume he paid the cheques into his own account, and cashed them. His wife, on more than one occasion, brought to my wife sums of £35 and £40, and they were placed to Mr. Rudolph's credit until the whole sum of £250 was repaid. I know from personal observation that Mr. Rudolph and his wife not only strained every point to pay the money back, but that they actually denied themselves the common necessaries of life in order to do so. Upon more than one occasion I remonstrated with them and told them to take their time, and that they were not to go in for any niggardly cheese-pairing and scraping in their household affairs simply in order that they might be able to repay the money a month or two sooner than they would otherwise have been able to do. That is the history of Mr. Rudolph's transaction, as far as I know it. As to O'Hanlon's business, his mother was rather a wealthy woman living at home, and she told him, on the occasion of his marriage, that she would send him out sufficient money to build a house for himself. He, knowing that we were in touch with building and that sort of thing, consulted me. I assisted him in the purchase of the land and in the design of his house, and also in the purchase of the material. I supplied him with a good working foreman also to carry out the work. I advanced him a sum of money temporarily, and when the house was sufficiently advanced to entitle him to receive some money on it—before his mother sent him the money she had promised to send him—he obtained a loan from some one through Johnson, Minter, and Simpson, and executed a mortgage covering me so far as the amount I had lent him was concerned. When the money was received from England, or Ireland—I forget which—Johnson, Minter, and Simpson repaid the advance of £600 to my account, that being the amount of Mr. O'Hanlon's indebtedness. The whole transactions were done through Johnson, Minter, and Simpson, under mortgage.
7704. *Mr. Smith.*] Since the occasion of this loan to Rudolph has he been supervising any of your contracts? No.
7705. And so far as Mr. O'Hanlon's matter is concerned, has he been supervising any of them? No.
7706. Neither of them has done so? No.
7707. *Mr. Parkes.*] Did they sign any of your vouchers? Not that I am aware of. It would be news to me to find that they had done so.
7708. *Mr. Gummow.*] As to Mr. Rudolph, when did you draw the £250 to give him;—was it from your own account? I could not tell you, but I think it was from Carter & Co.'s account.
7709. Was it Carter and Co. who made the loan to Mr. Rudolph? No.
7710. Then why did you go to Carter & Co. for the money, if they had nothing to do with the transaction? I drew the money on my own account, and I was responsible for it to the firm. There was no money in my own private account at the time, and I borrowed £250 of Carter & Co.
7711. If Mr. Rudolph had not paid the money back, who would have suffered? I should have had to repay the money to the firm myself.

7712. Do you recognise that acknowledgment? Yes; it is as follows:—"We hereby acknowledge the receipt of £250 from Mr. J. Carter, and promise to pay the same back at the rate of £30, payable every two months after the first day of May. The balance between our payments and the full amount of £250 to be paid on 1st May, 1893, should Mr. Carter wish us to do so." J. C. Carter.  
8 July, 1896.
7713. By whom is that signed? By Mr. Rudolph and by his wife.
7714. Do you know why his wife signed it? As a double security, I suppose, so that in the event of Mr. Rudolph's death we might look to her for the repayment of the money.
7715. You say you lent some money to Mr. O'Hanlan? Yes.
7716. Did the firm of Carter & Co. lend him the money, or did you? I lent it him.
7717. From what account did you draw it? From the firm's account.
7718. And did you hold yourself responsible to the firm for the amount? Yes.
7719. Was the money paid back to you or to the firm? I think it was repaid to Carter & Co., on my instructions. I see from the acknowledgment you now hand me that the payment was made to Carter, Gummow, & Co. The memorandum from Johnson, Minter, and Simpson, says:—"In accordance with your request, we have to-day paid into the Bank of New Zealand, Pitt-street, to the credit of Carter, Gummow, & Co., Contract 69 account, the sum of £600."
7720. Do you know where the document in Mr. Weedon's case was made out and signed? No.
7721. On what date did Mr. Weedon pay the money, do you know? On 18th June, 1895.
7722. Do you know where Mr. Weedon was employed then? Yes; in the Water Supply Branch.
7723. Had he anything to do with the Sewerage Branch at that time? No.
7724. As to Mr. Baltzer, you paid a cheque for £159 into his credit—why did you pay that amount in? The Treasury paid it in.
7725. Why did they pay it into the account of Carter, Gummow, & Co.? Because I undertook to look after the money for him. The Treasury had an order to pay it into our account.
7726. Where was Mr. Baltzer at the time? In Germany or Austria.
7727. You acted as his agent while he was away? Yes.
7728. Have you repaid that money to anyone? Yes; it was repaid to Messrs. Laurence and Rich, solicitors.
7729. As to the dealings you had with the Mint, what were they? They were in connection with a return of gold smelted from the Post-office mine; after settling up with Boehme for wages and paying a half share.
7730. Did you not tell Mr. Parkes that this money was in connection with the sale of a gold mine? Perhaps I did. I do not know whether I meant to convey that impression. Now that you correct me I know that the amounts were for the gold.
7731. You received cheques from the Mint and shared the money with the parties interested, and Boehme was one of those parties? Yes.
7732. As to the cheque of Ahearne's for £270 which was paid in—what do you say about that;—do you remember whether Ahearne deducted £18 from one of the accounts you had with him for a special object? Yes.
7733. Do you remember what account it was? Yes; it was for white metal.
7734. Do you remember roughly the quantity of metal? No. I know it was a good large quantity, but I could not remember the quantity now.
7735. Do you think the amount would be £300? I could not tell you.
7736. Do you remember £18 being taken off the amount for squaring up? Yes.
7737. You objected to it? Yes.
7738. It must have been a good big lump of metal to justify the taking off of that amount for squaring up? Yes.
7739. As to these loans you made to other contractors of cement and different material—did they pay you any interest on the loans? No.
7740. Did you derive any benefit from the lending of the cement? No.
7741. Did you get any of the cement returned? Sometimes, I expect. It was done in various ways; whichever way would suit them suited me.
7742. But did you get any benefit from the transaction? I had always plenty of bother and very little benefit.
7743. *Mr. Parkes.*] The last money you gave to O'Hanlon was £60 in cash? Possibly.
7744. Did you ever give cash to any other officer of the Department for any reason? Not that I am aware of.
7745. But did you do so? Not that I remember. I should say not. I did not give Mr. Rudolph cash. It was all in one cheque.

George Christie sworn and examined:—

7746. *Mr. Parkes.*] What are you in business? A public accountant,
7747. You have an extensive practice? Yes, I have been some ten years in practice.
7748. At the present time you occupy the position of City Auditor? Yes.
7749. What other positions of the kind do you hold? I do auditing for various companies and large firms.
7750. But what public positions do you hold as auditor;—do you not make municipal audits? Yes, a large number; and I have done various work of the kind for the Government from time to time.
7751. Acting upon my instructions you examined the various accounts of merchants in the city showing their sales of cement to Carter & Co., Carter, Cummow, & Co., and the bills of delivery and other particulars in connection with their various contracts? Yes, I have been engaged in the investigation for some days.
7752. You have gone thoroughly through such cash and other books as have been given to you? Yes, I have taken as my basis of operation the bank pass-books and the cheques for the payments which have been made as shown therein.
7753. You have made a thorough search through the books of all the merchants who have supplied cement to these contractors? Yes.

G. Christie  
8 July, 1896

7754.

- G. Christie. 7754. And you have no doubt in your mind that you have found them all? Yes.  
 7755. You have perused the ledgers of these merchants? Yes. I have visited the offices, and I have seen the principals of the whole of the establishments whose names appear in these books as vendors of cement.  
 7756. And they have supplied you with all the necessary information? Yes. The firms in all cases where they have sold cement to Messrs. Carter & Co. and Messrs. Carter, Gummow, & Co., have supplied me with full information.  
 7757. They have given you certain statements with reference to those sales, have they not? Yes; they have furnished information in writing, and I have found that it agrees with the information conveyed by the books.  
 7758. You have checked everything, and you have no doubt in your mind but that your audit is perfectly correct? That is so.  
 7759. From the year 1892 to the year 1896—(say) from the month of June—how much cement, taking the number of barrels, was bought by Carter, Gummow, & Co. and sent to the various contracts on which they were engaged? I have prepared a report so that the information might more clearly be put before the Commission, and I will read it—

## MEMO. No. 1

Re the delivery of cement on Messrs. Carter & Co.'s and Messrs. Carter, Gummow, & Co.'s contracts, from 1st January, 1892, to 30th June, 1896.

(a) Reference is made to the evidence taken before the Commissioner, and to Mr. J. Carter's examination, 29/6/96, and his reply to Questions Nos. 6403 to 6411.

(b) The contractors having, in their examination before the Commissioner, stated that all payments for cement would appear in their firm's banking accounts, the bank pass books of their several accounts, and the cheques relating thereto, were carefully examined.

The vendors of cement whose names thus appeared were visited by me personally. I inspected their books (with the exception of those of Mr. John Try) relative to their transactions with the contractors, and obtained from such of them as had sold cement to the contractors since 1st January, 1892, full particulars of their sales and deliveries. And, as to the purchases from Mr. John Try—the agreement with him dated 13th May, 1895, being for colonial cement in bags at a price equal to 9s 6d. per cask delivered at Railway Station, Darling Harbour, for Annandale, and the payments to Mr. Try amounting to £588 6s.—the deliveries from Mr. Try have been set down at 1,200 casks.

(c) From these and other inquiries I have been able to produce the accompanying statement, which sets forth the whole of the deliveries of cement on the contracts of Messrs. Carter & Co. and Carter, Gummow, & Co., from 1st January, 1892, to 30th June, 1896. This statement shows a total of 21,572 casks of cement, distributed to the various localities as follows, viz—

|   |                |
|---|----------------|
| North Shore—<br>Contracts 79 and 79A              | Casks<br>6,702 |
| Marrickville—<br>Contract 69                      | 6,729          |
| Total on these completed contracts                |                |
|   | 13,431         |
| Annandale and Leichhardt—<br>Contracts 77 and 118 | 7,719          |
| Waverley (in 1892)                                | 250            |
| Sundry  | 172            |
|   | 422            |
|   | 21,572         |

The contractors have, out of the above quantities, sold cement to other firms and to the Government, the total quantities of which have not yet been fully ascertained and deducted.

GEO. CHRISTIE,  
F.S.A.A.

Sydney, 8th July, 1896.

## PURCHASES OF CEMENT

(d) Carter & Co. and Carter, Gummow, & Co., from 1st January, 1892, to 30th June, 1896.

| Vendors               | Total  | Delivered to—          |                       |                                    |                   | Sundry |
|-----------------------|--------|------------------------|-----------------------|------------------------------------|-------------------|--------|
|                       |        | North Shore Contracts. | Marrickville Contract | Annandale and Leichhardt Contracts | Waverley Contract |        |
| Parbury, Henty, & Co. | 17,970 | 4,300                  | 6,729                 | 6,519                              | 250               | 172    |
| Henry Austin          | 1,402  | 1,402                  | .                     | .                                  | .                 | .      |

Compiled by  
GEO. CHRISTIE, F.S.A.A.

Sydney, 8th July, 1896.

MEMO.—Messrs. Carter & Co.'s sales to other contractors and to the Government, &c., have not yet been deducted from these totals.

7760. *Mr. Parkes.*] Have you checked the sales of cement with the bank pass-books of Messrs. Carter, Gummow, & Co. and Carter & Co. to see whether the amounts are correct? Yes.

7761. You find that they tally? Yes.

7762. Is there any statement you would like to make to His Honor founded upon your perusal of the accounts in connection with these cement transactions? I may say that a further investigation has been proceeding in connection with the advances on the cement on these various contracts which have been made by the Government.

7763. These advances are made under an agreement for a bill of sale, I believe? Yes.

7764.

7764. The information you are prepared to give deals with Contracts 79, 79A, and 69? I have dealt with only two Contracts 79 and 79A in this connection. I have prepared a written statement which, since it deals with figures, I will read:—

G. Christie.  
8 July, 1896.

## MEMO. No. 2.

AS TO ADVANCES ON CEMENT MADE TO MESSRS. CARTER & CO. ON CONTRACTS No. 79 AND 79A.

(a) *Department's Rule as to Advances.*—See printed papers, No. 8, page 360, viz., 75 per cent. of value up to 75 per cent. of contract deposit.

(b) *Contract No. 79.*—Contract deposit, £2,000, on which 75 per cent. would be £1,500. Advances throughout at 16s. per cask, and 100 per cent. of same.

900 casks in certificates Nos. 13 to 15—

|   | casks. |
|---|--------|
| 21 September, 1892—Parbury, Henty, & Co.... | 699    |
| 24 „ 1892— „ „ „ .....                      | 200    |

899, at 11/8, carted to N.S.

1,700 casks in certificate No. 16—

The above and

|  |   |
|--|---|
| 30 June, 1893—Parbury, Henty, & Co. .... | 500, at 10/3, delivered at N.S. by lighter. |
| 15 July, 1893—Henry Austin .....         | 400, at 9/9, in lighter.                    |

1,799. Only a little work requiring cement had been done.

2,700 casks in certificate No. 17—

The above and

|  |                            |
|--|----------------------------|
| 14 July, 1893—Burns, Philp, & Co. .... | 1,000, at 9/9, in lighter. |
| 20 „ 1893—Henry Austin .....           | 1,002, at 9/9, „           |

Delivery to July, 1893.....3,801 casks.

*Memo.*—Deliveries from Henry Austin and Burns, Philp, & Co. were on sales made June, 1893.

(c) *Contract No. 79a.*—Contract deposit, £485. The amount advanced exceeds 75 per cent of deposit £485 (namely, £360), in the following certificates:—No. 2, £375; No. 7, £656; No. 8, £656; No. 9, £656; No. 10, £656; No. 11, £539; and in all cases the advance is at 100 per cent. of the value, 9s. 4½d. per cask.

*Memo.*—There are on certificates certain advances under the heading of material, viz., No. 11, £718; No. 12, £500; No. 13, £165.

(d) From the foregoing it would appear that in Contract No. 79, the amount advanced in certificate No. 17, on 2,700 casks of cement—namely, £2,160—was £660 in excess of the Department's limit. It will further be seen that there was not the security for this £2,160, as the cement, at even an average price of 11s. 6d. per cask in the contractors' store, the value would only be £1,552 10s. The cement was thus over-valued to the amount of £607 10s.

(e) And, as regards Contract No. 79a, the amount advanced exceeded the Department's limit in certificates No. 2, 7, 8, 9, 10, 11, in the amount of £15, £296, £296, £296, £296, and £179 respectively.

Sydney, 8/7/96.

GEO. CHRISTIE, F.S.A.A.

7765. *Mr. Parkes.*] The cement upon which an advance is made of 16s. was really bought at a total cost of about 11s. 2d.? Yes. You will see that 900 casks were purchased at 11s. 8d., actually delivered at North Sydney when cement was slightly higher than the price at which it subsequently stood. Later on, cement was bought at 9s. 9d., delivered in lighter. You will see from the report that cement was bought at lower prices subsequently, but with less expensive delivery. But taking the average, 11s. 6d. would be the price throughout, delivered at the contractors' depot.

7766. With reference to Mr. W. A. Smith, who was an engineer in the Department, and his two cheques to Carter, Gummow, & Co., his cheque of £20 5s. was paid in on 8th February, 1895? Yes.

7767. It was Mr. Smith's official cheque to Carter & Co. for certain cement supplied for a culvert on the Parramatta Road, at Burwood or Strathfield? Yes.

George M'Credie recalled and further examined:—

7768. *Mr. Parkes.*] You are a member of the firm of M'Credie Bros., consulting engineers? Yes.

7769. You have made an investigation as to the total number of casks of cement paid for under the vouchers in respect of Contracts 79, 79A, and 69, have you not? Yes. (*Vide Appendix No. 15.*)

7770. You have made a similar investigation in respect of Contracts 72, 118, and 77? Yes.

7771. Will you tell us the total number of casks in connection with these contracts? Yes.

7772. What are the totals? On Contract 69, 11,134 casks; upon Contract 72, 12,008 casks; upon contract 77, 3,464 casks; upon Contract 79, 6,677 casks; upon Contract 79A, 3,323 casks; upon the High-street branch of 79A, 477 casks; upon 118, 8,144 casks; making a total of 45,227 casks of cement used on the contracts. That is, according to the quantities given in the final returns or the last progress returns of the respective contracts.

7773. Taking contracts 79, 79A, and 69, will you tell His Honor what quantity of cement is included in the vouchers upon which payments were made by the Government, including the High-street branch of 79A? 21,611 casks.

7774. Your calculation is based upon tests made to see how much cement would be consumed, and upon your knowledge of contracts generally? It is.

7775. How did you make the tests? We mixed the stuff dry and wet to see how much would be used, and we worked it out per yard.

7776. You used the same proportions as are contained in the Government specification—that is, you took a yard of brickwork at so much, the piping at so much, and the concrete at so much, making tests in each case? Yes.

7777. And your calculations on that basis come out at 21,611 casks for the three contracts I have named? Yes.

7778. If it had been proved that the purchases of cement for those contracts were only 13,431 barrels that would leave 8,180 barrels to be accounted for, would it not? Yes.

7779. You have proved your tests and figures over and over again, have you not? Yes; any that I had a doubt about. I have had a yard of brickwork laid, and others did so, so that I should be satisfied.

7780. And the same with the rendering to find out how many yards would be covered, and the same with the piping? Yes.

7781.

G. M'Credie.  
8 July, 1896.

- G. M'Creddie. 7781. Could you go 100 casks wrong in that calculation of yours? I do not think so. I am perfectly satisfied with these quantities.
- 8 July, 1896. 7782. If you look at page 318 of the Parliamentary papers in connection with Contract 79, you will see a letter from Mr. Davis advising that, as the contract contains such a large amount of heavy excavation, if the contractors make up solid with concrete all the original quantity blown out, they shall be paid on an average of  $3\frac{1}{4}$  inches thick. That was agreed to in a letter of August 21st, and accepted by Mr. Carter. The intent of such a letter would be that an average of  $3\frac{1}{4}$  inches would not contain the whole of the concrete which they would have to put in, would it not? I should take it to be so. I understand that to be the average upon which they would be paid upon the condition that they filled in all the vacant places they have excavated.
7783. It is possible then that from the method of taking out the rock there would be a considerable addition to the number of barrels of cement which you have taken into your account? There would probably be considerably more according to that letter, assuming that they had to fill up every vacancy caused by the excavation.
7784. The quantities you have taken out are based only upon the  $3\frac{1}{4}$ -inch margin? Yes.
7785. Therefore you must be within the limit? Yes; I consider that I am well within the limit under those circumstances.
7786. I believe that according to your return sixty casks were used for every hundred paid for? Yes.
7787. In sewerage work, owing to the escape of gas and the work being underground and covered in, the most careful work ought to be done? Yes.
7788. If there is an insufficient quantity of cement put into the material used, it would be defective work? Yes.
7789. In addition to the loss of money upon the scant supply of cement a greater cost has to be taken into consideration for the defective work itself? I should think so—in fact I am sure of it.
7790. Have you any doubt in your mind at all but that this cement has not been supplied? I could not say that.
7791. Have you any doubt at all as to your figures? I am perfectly satisfied that my figures are correct.
7792. You have taken them from the departmental vouchers? I have not only taken them out myself, but my partner has gone through them all, and has checked them.
7793. They have been taken from the departmental vouchers upon which the contractors have been paid? Yes.
7794. *Mr. Davis.*] You examined several weeks ago some of the brickwork upon Contract 79? Yes.
7795. What impression did you derive as to the nature of the compo. from what you then saw? My idea was that it was very good.
7796. There was nothing to indicate that there was any shortage of cement in it? I could not say from the surface. It looked all right on the surface.
7797. You stood by when the bricks were being knocked out? Yes. I was perfectly satisfied.
7798. You thought it good work? Yes.
7799. There was nothing to indicate that there was any shortage of cement? No. You will perhaps remember that I said so when I gave my evidence before.
7800. You had an opportunity to see the rendering upon the whole of the sewer and in the shafts in the case of Contract 79? Yes.
7801. As a man of considerable experience will you say whether there was anything in what you saw to denote a shortage of cement? No. There was nothing there to indicate a shortage of cement.
7802. If you had had the supervision of these contracts and had been making your final inspection would you have come to the conclusion that all the cement specified had been put into the compo.? Yes.
7803. It looked all right? I could not come to any other conclusion from looking at it.
7804. Now with regard to the bluestone concrete, how did you arrive at the quantity of cement in a cubic yard of bluestone concrete; what proportions are specified in the case of Contract 69? 4, 2, and 1. The cement and sand disappear in the metal. I found that there was 1·6875 casks of cement in a yard of concrete.
7805. Have you had any very extensive experience in the use of those proportions in concrete? Yes; I have had a good deal of experience in 4, 2, and 1, and 5, 2, and 1.
7806. I want you to speak from your general experience, and not from a single experiment. Taking 16 cubic feet of stone, 8 feet of sand, and a cask of cement, do you say that that would make only 16 cubic feet of bluestone concrete? Yes.
7807. You are quite positive about that? Yes.
7808. Are you speaking now from the experiments you have made? From experiments I have made from time to time in connection with that class of work.
7809. What gauge of stone did you use in this particular experiment? I could not tell you the gauge of the stone.
7810. Do you not think that the gauge of the stone has a great deal to do with it? I am speaking now of my experiments on different jobs. If you are referring to the experiment as regards this particular class of stuff, I think the gauge of the metal was  $1\frac{1}{2}$  inches.
7811. What was the size of the gauge-box which you used for your experiment? It was an ordinary sized gauge.
7812. But I want to know what size? The ordinary size for mixing up a yard of metal.
7813. How much would it contain? A yard of stuff.
7814. A yard of bluestone? Yes.
7815. What quantity of sand did you put to that? Two of sand and one of cement.
7816. How much sand did you put to 27 cubic feet of bluestone? I have not the particulars here.
7817. I should have thought that seeing you were so positive in what you said, that you had the particulars with you? I can easily obtain them.
7818. I want to know what quantity of sand you put to the 27 cubic feet of  $1\frac{1}{2}$ -inch blue-stone metal? We mixed in the proportions of 4, 2, and 1.
7819. But you do not know the quantities you put in? I have given you the proportions.
7820. But you cannot answer my question as to the quantities? Not without reference to the exact particulars.

7821. So that as a matter of fact you are not sure about even your experiment? I am perfectly satisfied G. M'Creddie.  
as to the figures I have given. All the data are in my office, and I can give you all the information you  
want when I have the particulars in front of me. 8 July, 1896.

7822. Coming now to the sandstone concrete—what proportion of sandstone did you use to the sand and cement? The proportions were 5 of sandstone, 2 of sand, and 1 of cement.

7823. Did you make an experiment with those proportions? Yes.

7824. What was the gauge of the stone in that case? It is difficult to say from memory, but I can give you all the particulars later on.

7825. I should prefer to have the particulars now—it is a very important matter? The proportions were taken in each case from the specification, and you cannot expect me to carry in my head the specifications of five or six different contracts.

7826. Can you say whether the stone specified for the sandstone concrete is of a different gauge in the three contracts—79, 79A, and 69? I cannot tell you that unless I go into the quantities. You have all these contracts at your fingers' ends, but you cannot expect me to remember every item.

7827. What does a cubic yard of stone make in the case of the sandstone concrete? A cubic yard. If you mean the cement used, there would be 1.35 casks to the yard.

7828. How much would 27 cubic feet of sandstone make in concrete? A yard.

7829. No more? No.

7830. You know that from experiments? Yes.

7831. Have you used it in your work in the proportion of 5, 2, and 1? Yes.

7832. You know from your experience, then, as well as from the experiment you are supposed to have made, that 27 cubic feet of sandstone will make 27 cubic feet of concrete? I think you must misunderstand me. What I mean to say is that I made an experiment only in regard to certain things. As regards other matters, I take them from my practical experience in the past. I made experiments in the laying of brickwork of the same kind that would be found in your sewer.

7833. You have not experimented, then, as regards the sandstone concrete? No. As regards those two things, I am speaking from my practical knowledge.

7834. You have made no experiments with these particular mixtures? No; the experiments I made were in the laying of the brickwork and in the rendering.

7835. So that your calculations are based not upon experiments with these mixtures, but upon your idea as to what one cask of cement would make? I have made experiments in regard to the two things I just mentioned. The other matters are based on a practical experience extending over the past fifteen or sixteen years.

7836. Taking the brickwork experiment which you have made, what joints did you allow? Ordinary joints.

7837. What joints are specified? Now you are referring me to the specifications again.

7838. If you made the experiment you should know what the joints were;—you are supposed to make the experiment on the basis of the specification? The experiments were on the basis of the specification.

7839. What instructions did you give the men who put up the yard of brickwork? I could not tell you unless I looked at the details. I see that the cement ran out at .5 per yard.

7840. You say that the figures showing the total number of casks are taken from the vouchers in Contracts 69, 79, and 79A, including the High-street branch? Yes.

7841. I suppose you can give us particulars showing how you arrive at the total in the case of each contract? They are all in the return which I have handed in.

7842. *Mr. Gummow.*] You said that you were sure that your calculations were correct to within 100 casks? Yes.

7843. Can you tell me how much two-ring brickwork is included in the total of the brickwork of these three contracts, and also how much one-ring work is in them? No, I could not.

7844. Could you tell me whether it takes the same proportion of cement for two-ring work as for one-ring work? There is a joint extra as between two-ring and one-ring, of course.

7845. Would it make some difference? Yes, it would make a difference, but it can easily be calculated.

7846. Would it make a difference of 100 casks? I could not say unless I calculated it.

7847. Then you do not know whether your calculation is correct to within 100 casks? I am satisfied I am correct in the figures I have put down.

7848. Do you know whether the work is all two-ring or one-ring? No.

7849. Yet you say your calculation is correct? Yes, upon the Government vouchers.

7850. Do the Government vouchers specify the two-ring and one-ring work? No.

7851. Then how can you make the statement that your calculations are correct to within 100 casks if you have not the full particulars? But I had the full particulars. I got them from the vouchers.

7852. You had certain particulars to work upon, and from those you argue that your figures are correct? They are right if I had the correct particulars. Of course, if I had not the correct particulars an alteration would require to be made.

7853. You do not know for certain that you had the whole of the particulars? No.

7854. You do not know exactly how much two-ring work and how much one-ring work there was? No.

7855. And you consider that there would be a difference in the two cases? Certainly, in two-ring work as against one-ring work.

7856. And yet you said you would stake your professional reputation upon the figures being correct? Yes; I am perfectly satisfied that they are correct.

7857. As to the bluestone concrete, you say that the proportions in the specification are 4, 2, and 1? Yes.

7858. And you say that all the sand and cement is lost in the interstices of the stone? Yes, that has been my experience.

7859. Would you stake your professional reputation on that statement? Yes, on the statement that that is my experience.

7860. And the same with regard to sandstone concrete? Yes.

7861. *Mr. Parkes.*] It did not much matter to you what the nature of the work was—you took the vouchers upon which the contractors were paid? Yes.

7862. As a matter of fact, if the work happened to be two-ring brickwork that would increase the number of barrels of cement? Yes.

- G. M'Credie. 7863. In the laying of all sorts of brickwork, and particularly in tunnels, there is a tremendous amount of waste? Yes.
- 8 July, 1896. 7864. That is all thrown in in your calculation? Yes.
7865. In making up your calculations, you carefully perused the specification in every case? Yes.
7866. And every calculation you have made is according to specification? Yes.
7867. You could not remember the details in every case without going through the specification? No.
7868. Did your brother make out any calculations? I got him to check them.
7869. He went through them as well as you? Yes.
7870. Were they gone through by any one else in your office? Yes.
7871. Are there not standard works which guide engineers and other professional men in these proportions? Yes.
7872. What do they say upon these points? You will find that they pretty well agree with the figures I have put down.
7873. Did you look them up? Yes; I looked at Molesworth and Hurst.
7874. *His Honor.*] As to what? As to the quantities in a yard of brickwork, and as to the disappearance of the sand and cement. But I prefer taking practical tests against the standards. In this case, however, the standards and the practical tests came out pretty closely together.
7875. *Mr. Parkes.*] Do the standards give an absolute extinction of the sand and cement? They give the proportions according to the quantities that are mixed. The standard and the practical tests are about the same. In the case of the compo. we were talking about the other day, they are practically the same.
7876. What do the standard works say about concrete of 4, 2, and 1? I could not tell you just now; but the figures are about the same as those which you will find in the papers I have handed in.
7877. As to the proportion of cement in Contracts 79, 79A, and 79A, High-street Branch, for every hundred casks paid for sixty-four have been delivered? Yes.
7878. Then take Contract 69;—what is the number of casks given in that case? 11,134.
7879. And taking Mr. Christie's estimate of the quantity delivered to be correct—that is to say 6,729;—what would be the proportion? About sixty-two for every hundred paid for.
7880. Taking the contracts all through you think the average would be about sixty-two for every hundred paid for? Yes.

Thomas Robert Steel sworn and examined:—

- T. R. Steel. 7881. *Mr. Parkes.*] You are accountant in the Department of Public Works? Yes.
- 8 July, 1896. 7882. Is it not usual to keep all records of authority for the payment of moneys upon certain public works, and also all the vouchers in connection with such payments? I have no knowledge of records. I am the accountant of the Department. I believe that the ordinary practice is to keep records. It is our custom to keep accounts.
7883. But as to other papers, such as authorities for the work, and that sort of thing? That is a matter which comes within the province of the chief clerk.
7884. You have all the vouchers? Yes.
7885. Have you every voucher in connection with the culvert at Strathfield? It is impossible to say. I could not identify them unless the name of the culvert were specifically stated upon the face of the voucher.
7886. Suppose authority were given for the expenditure of £200 upon one work, and £1,000 upon another work, and £500 on a third, would not the accounts in connection with those works be kept separately? The expenditure of money in connection with the Monier culvert, for instance, would not be kept distinctly from the expenditure upon the Main Western Road.
7887. Is it not the rule of the office to keep all expenditures of money upon particular works within the authority given? I know nothing about the authority to expend.
7888. But is it not the practice to keep each public work separately in your account books? Yes.
7889. Do you ever indulge in the practice of taking a sum of money from a Vote for one public work for expenditure upon another without authority? Not without the authority of the Minister, and frequently that of the Executive Council.
7890. But it is done sometimes? Yes.
7891. Has it ever been done without the authority of the Minister? Not to my knowledge.
7892. Therefore all payments for the Strathfield culvert should be in one account? Together with those for the Main Western Road.
7893. A culvert was recently built at Ashfield;—would you not keep the expenditure in connection with that culvert separate from the general expenditure upon the Main Western Road? No.
7894. It would go into the Main Western Road expenditure? Yes.
7895. You would not keep the accounts in connection with each work separately? No.
7896. *His Honor.*] Then you could not tell whether the expenditure has gone into a culvert at Ashfield or into a culvert at Gongolgin? Not if it were done by day work. The vouchers would show the wages of the men for the month. They would not show the distribution of the expenditure upon works on the line of road.
7897. That is, whether a man were working one day at Strathfield, the next day at Ashfield, and another day at Parramatta, and so on? Quite so.
7898. Is that the way in which the accounts are kept? The wages are made out for the month in the case of the regular maintenance men, and frequently for a fortnight in the case of men at work on special jobs. The vouchers would not always distinguish the particular works upon which the men had been engaged. They would show that the men were engaged upon one particular line of road, but they would not show the specific work upon which they had been employed.
7899. *Mr. Parkes.*] Supposing the officer at Parramatta were asked for the expenditure in connection with some particular work upon the Main Western Road from Sydney to Dubbo—say the cost of a bridge—how would he arrive at the expenditure? He would communicate with the local officer.
7900. How would he make up the expenditure? There would be the record of the men who were working each day on different works.

7901. Who would be the officer to whom to apply for such information in the case of the Strathfield culvert? Mr. James Symonds, sen. I know that from seeing that he signed vouchers marked "Monier culvert."
7902. *Mr. Smith.*] I believe you received an order signed by Mr. Davis for the production of certain papers in connection with this culvert at Strathfield? Yes.
7903. And you have produced all the papers you have in connection with that culvert? Yes.
7904. They are all here to be seen by any one who wishes to see them? Yes.
7905. The papers, I suppose, would include all the vouchers relating to the Main Western Road about that time? No. The Main Western Road under Mr. Symonds would extend from Sydney to a point somewhere beyond Emu Plains.
7906. Have you all the vouchers in connection with the expenditure upon that piece of road? We can obtain them all if they are wanted.
7907. But you have obtained all those relating to this particular culvert? All those which Mr. W. A. Smith picked out and identified as relating to that culvert.
7908. Has Mr. Bryant, who was examined the other day, asked for any vouchers beyond those already produced in connection with that culvert? Not to my knowledge.
7909. *His Honor.*] Your knowledge would relate exclusively to the accounts? That is all.
7910. Have you given to Mr. W. A. Smith, for his information, all the particulars which you can give from the accounts over which you have control? Every information.
7911. You cannot give Mr. Bryant any further information? Nothing further that I am aware of, but anything which he may ask for I will endeavour to obtain and put in his possession.

T. R. Steel.  
8 July, 1896.

William Thompson sworn and examined:—

7912. *Mr. Parkes.*] You have made out a calculation, taken from the Government vouchers, showing the number of casks of cement necessary for the execution of the various items paid for by voucher in connection with Contracts 69, 72, 77, 79, 79A, the High-street branch of 79A, and No. 118? Yes.
7913. What do you make the total quantity of cement necessary for these contracts to date of last certificate? 45,354 casks. [*Vide Appendix No. 17.*]
7914. What was the total number of casks of cement necessary for the cement-work paid for according to the vouchers upon Contracts 69, 79A, and the High-street branch of 79A? 21,637.
7915. You have made up your calculation from standards showing how the materials combine together and the quantities they make? Yes. From standard and practical experience in taking out the concrete in contracts for the last ten or twelve years, I have allowed the cement and sand to disappear bodily.
7916. Do you feel certain about your calculations to within 100 casks? Yes.
7917. Did you make any calculation for waste in material? No.
7918. You have looked over the Parliamentary papers? Yes.
7919. You have noticed a letter in the papers referring to how the concrete is to be paid for in connection with the margin round the sewer? Yes. I noticed in one case that some particular thickness was to be allowed for.
7920. Was it a proportion? I forget exactly.
7921. Was it given as compensation for the substitution of blasting for guttering and gadding? Yes.
7922. To make up the difference? Yes.
7923. Therefore the quantity you have estimated is likely to be less than was actually required, is it not? Yes.
7924. So that your calculations, if you take into consideration the filling in of the cavities, would have to be greater, if anything? Yes. My calculations are founded upon the quantity of cement-work actually paid for.
7925. Have you at odd times had to make up contractors' estimates for concrete? Yes.
7926. What has been your practice in these cases in estimating the proportions of stone, sand, and cement? If the stone is of a coarse description at all, the sand and cement will disappear bodily. They will just fill up the interstices.
7927. Have you made any tests from the specification? I have seen tests made by contractors.
7928. But you have made your computations from the nature of the material specified? Yes.
7929. You have read the specifications in the case of these contracts? Yes.
7930. Have you taken any cognisance of an agreement for a bill of sale in respect of the contractors' cement;—have you noticed that the percentage paid under this agreement is not on the material actually fixed in the work, but on the material in the contractors' stores? No, I did not go into that.
7931. Do you know of any case in private business where money would be advanced upon material under such circumstances? Not unless it were actually in the work. In private practice it is never done, of course.
7932. Advances are made only upon the fixed work? Yes.
7933. Do you know of any case in which payments have been made otherwise? I never heard of such a case in private practice.
7934. There is no doubt in your mind but that the quantities you have given are well within the mark? I think there could be no doubt as to that.
7935. Supposing the waste were accounted for, what do you think it would make—taking the cement used in the tunnel work? I could not speak as to the extent of the tunnel work.
7936. What would the waste amount to in ordinary plastering,  $\frac{5}{8}$ -inch thick? There would be very little waste.
7937. What about the plastering of the soffit of an arch or of a tunnel;—what would the waste be in that case? There would be a certain amount of dropping, but it would not be very large.
7938. Is it a difficult thing to plaster a circular soffit? Yes.
7939. Is there not a great deal of waste in plastering a circular soffit? There is a fair amount of waste in that case.
7940. Therefore your calculations as regards the fixed material allow for a very fair margin? Yes.
7941. *Mr. Davis.*] You say that when coarse stone is used for concrete the whole of the sand and cement which are used disappear? Yes.

W.  
Thompson.  
July, 1896.

- W. Thompson.  
8 July, 1896.
7942. And in making your calculation in respect of Contracts 69, 79, and 79A you went upon that assumption? Yes.
7943. You went upon the assumption that the stone would be coarse? Two-inch or 1½-inch stone, as the case might be, and as specified.
7944. Did you go upon the assumption that the stone would be so coarse that the whole of the sand and cement would disappear? At that gauge.
7945. What gauge? Two-inch metal in one case, and 1½-inch in the other. I referred to the specifications.
7946. *Mr. Gummow.*] You said you had obtained some information from what you had seen in connection with certain contracts? Yes; my information is obtained from experience spread over the last ten or twelve years.
7947. I mean information regarding gauging according to the specification? Yes.
7948. Where did you see the gauging specified in the case of these contracts mixed? I have seen the same stuff used in the case of private buildings repeatedly. I have seen and used the same size of metal and the same gauging frequently. It is pretty well a stock concrete.
7949. Do you know if any other contractors with the Sewerage Department obtain advances on cement? No. I have had very little to do with the Sewerage Department.
7950. *Mr. Parkes.*] In reading through the papers did you notice this memorandum:—

In consideration of the Minister for Public Works, in and for the Colony of New South Wales, advancing to us the sum of £1,000, and of any future advances to be made to us, we hereby agree to repay to the said Minister for Public Works the said sum of £1,000, and future advances, together with interest at the rate of £6 per centum per annum on such sums respectively from the date of advance, on demand, and we hereby charge all moneys due or payable, or becoming due or payable, to us under a certain contract for the construction of the Eastern Main Branch Sewer, Western Suburbs Drainage, Contract No. 69, Sydney Sewerage Works, in the said Colony, entered into by us with the Government of the said Colony; also all cement, building materials, and every other thing already used, or to be used, in connection with our said contract, with the repayment of the said sum of £1,000, and any future advances, and interest at the rate aforesaid; and we hereby undertake to give, whenever called upon to do so, a valid bill of sale to the said Minister for Public Works over the said cement, building materials, and every other thing used in connection with our said contract, now stored in our premises at Illawarra Road, Marrickville, in the said Colony, or elsewhere; such bill of sale to contain a power of sale, and such other powers, provisos, and agreements, as the said Minister for Public Works may be advised. We also further undertake to give immediate possession of same to the said Minister, or any person appointed by him for that purpose, whenever called upon to do so.

? Yes.

7951. *Mr. Smith.*] Do you say you never heard of private individuals lending money under similar securities to those named in the document you have just heard read? Not as proprietors in the case of contracts in progress, though, of course, an individual might take a lien over such security.
7952. *Mr. Parkes.*] They would be in trouble if the contractors went insolvent, would they not? Yes; if the material were liable to be removed, of course.

Harold Francis Norrie recalled and further examined:—

- H. F. Norrie.  
8 July, 1896.
7953. *Mr. Parkes.*] When the document was drawn up, allowing of an advance being made on a bill of sale to the contractors in respect of their unfixed material, was it submitted to the Minister for approval? I do not know.
7954. Did you submit it? No.
7955. Who instructed you to draw up such a document? I cannot trace the papers upon which I got my instructions, but that I had instructions to draw it up I am satisfied. I should not do it without instructions.
7956. Did you get Ministerial approval? I do not recollect having had it.
7957. Do you know whether the head of the Department ever got Ministerial approval of the document? I do not know.
7958. Take the cases of Contracts 69, 79, and 79A, the same thing occurred in connection with every one of them;—does your reply to my question refer to the whole of those contracts? No; I think the papers show that I had instructions through the Sewerage Department in the other cases.
7959. Had you Ministerial authority in those cases? I do not recollect it.
7960. *Mr. Smith.*] You know that it has been the custom in the Department to make these advances? I know it as a matter of practice.
7961. *His Honor.*] For how long? When I came to the Department from the Crown Solicitor's office I found that these advances were being made, and that no document of any kind was taken. I then prepared the form of undertaking which Mr. Parkes read to the last witness, and I submitted it, to the best of my recollection, to the then Crown Solicitor for his perusal. It had been the practice, I found, to make the advances before I came down to the Department.
7962. *Mr. Smith.*] And the form generally used in these cases was, you think, submitted to the Crown Solicitor? Yes; I thought it would be very much better to do so.
7963. From the fact of your having drawn this form for this particular contract, No. 69, you feel confident that you must have had the usual instructions to prepare it? I am quite satisfied that I had.
7964. You did not draw it on your own motion;—you must have had the usual instructions? Yes.
7965. I think in the new general conditions reference is made to the possibility of advances of this kind being made? Yes; I think in clause 34.
7966. *Mr. Gummow.*] When you came from the Crown Solicitor's Department to the Works Department you say you found that advances were being made without any documentary evidence or bill of sale? So I was given to understand.
7967. Do you know whether Carter, Gummow, & Co. ever received any advance without signing a bill of sale or a memorandum of this sort? I do not, of my own knowledge.
7968. Do you know whether Carter, Gummow, & Co. were the first persons who received this advance upon material? I understood when I came down from the Crown Solicitor's Department that contractors had been receiving such advances occasionally.
7969. Do you know whether we were the first firm which received this particular concession? I do not know, but I do not think so.

7970. Supposing a firm, after you advanced £1,000 or £2,000 upon a large contract, went insolvent, would you have any redress upon the strength of your memorandum? I should put it in as proof of debt.
7971. But would you have any security at all? We have the cash deposit, and we have also the retention money. There is 10 or 20 per cent. retention money. More than that, I understand that the advance upon cement was made only at the rate of 75 per cent. upon the then existing market value.
7972. *Mr. Parkes.*] Is this advance on all material or only on cement? I take it that it covers any other material.
7973. You think it would apply to any material as well as cement? Yes.
7974. Is it a fact that this advance has been made upon cement only to the extent of 75 per cent. of its market value? That I do not know. As regards that matter, I am speaking from hearsay. I have had nothing to do with the advances.
7975. Do you not know from the vouchers that advances were made to the extent of 100 per cent.? I never looked at the vouchers. Therefore I do not know about that?
7976. You cannot be sure that the condition as to the advance to the extent of only 75 per cent. is being carried out? No.
7977. You cannot be sure either that the advance is made on the market price? No.
7978. *Mr. Smith.*] You drew up a security for a particular sum according to your instructions? Yes.
7979. How that sum was arrived at you do not know? No; and I did not wish to know.

H. F. Norrie.  
8 July, 1896.

James Symonds having made an affirmation was examined:—

7980. *Mr. Parkes.*] You were in the Public Works Department at one time? Yes.
7981. When did you leave? I was retrenched on June 30th of last year.
7982. At the time of your leaving what was your position? I was Road Superintendent for the Parramatta District.
7983. Do you recollect a culvert being built at Strathfield upon what is called the Monier system? Yes.
7984. Did anything happen to that culvert? Nothing special, that I am aware of.
7985. Did you exercise close supervision over its construction? I had a general oversight of it. There was a foreman on the ground appointed by Mr. Smith. I paid the men.
7986. You did not see the construction of the work then? I visited it on two or three days in each week.
7987. Do you know what the work cost? I have never reckoned it up closely, but I could tell you if I had access to the voucher book.
7988. *His Honor.*] Do you know anything about the cost? I know that the money authorised was not half sufficient.
7989. *Mr. Parkes.*] What was the amount authorised? £110.
7990. You paid the vouchers for the work? Yes.
7991. Did the cost exceed £200? I think the cost was between £230 and £250, but I would not be certain of the exact amount.
7992. If you saw the books you could pick out the items? Yes.
7993. Did you ever hear of anything happening to the culvert? Not that I am aware of. I had very great doubt in my mind as to whether it would be strong enough, but on seeing the principle worked I felt fairly satisfied that it would stand.
7994. Do you know if any iron bars or cambered plates or anything of that description were afterwards put in to sustain the work? Not to my knowledge.
7995. Was anything of that kind put in while the work was going on? Not to my knowledge.
7996. Did you see the whole of the construction? I was there twice-a-week.
7997. Those would be casual visits? Yes, on my ordinary rounds. I might have had a dozen other matters to see to at that time.
7998. Do you know how the accounts of the road expenditure were kept—if, for instance, there were a culvert to be constructed at Strathfield and a bridge at Parramatta, would the accounts of those two works be kept distinctly? They are supposed to be kept distinctly.
7999. Did you yourself keep them distinctly? As far as I was able.
8000. What vouchers did you send on to the Department in connection with this culvert? I could not say without referring back to my books.
8001. What was your book called? Well, there would be the record book.
8002. If that book were produced could you pick out all the papers relating to this culvert? Yes.
8003. Do you know where the money was taken from to make up the necessary amount? It was paid out of the main Western Road vote.
8004. You know for certain that the money authorised for the work was insufficient? Yes.
8005. When did it run out, do you know? As nearly as I can remember when the work was half completed.
8006. What was the sum total allowed for the work? I think £110.
8007. Might it not be £123? No, I think that was in connection with another culvert at Ashfield.
8008. When you were making up your estimate, did you put in 15 per cent. for royalty to Carter, Gummow, & Co.? I did not make out an estimate in connection with the first Monier culvert, but I made out an estimate afterwards for the second culvert at Ormond-street, and I think 15 per cent. royalty was allowed.
8009. Who instructed you to do that? Mr. W. A. Smith told me that 15 per cent. royalty was to go in in that case, but the culvert was never constructed, I think.
8010. *His Honor.*] You are referring now to the culvert which it was intended to construct at the corner of Ormond-street? Yes.
8011. What was the exact position of the first culvert—the one which was constructed? We called it the Burwood culvert. It was at the foot of the Wentworth road.
8012. *Mr. Parkes.*] Is it near Dawson's property? That I cannot say.
8013. Did it cost more than an ordinary 9-in. brick culvert would have cost? Yes; it cost much more. I made out an estimate for a 9-inch brick barrel culvert, and I think the amount came out to £110. There was an old brick barrel culvert there, and I thought that if a new culvert were constructed upon the same method it would be sufficient. The bricks of the old culvert were inferior.

J. Symonds  
8 July, 1896.

- J. Symonds. 8014. Did you send your estimate into the department? Yes.  
 8015. With a report? I believe so.  
 8 July, 1896. 8016. *Mr. Smith.*] I think you recommended that £300 should be put upon the estimates for this work? Never.  
 8017. I think you said you paid the men on the main western road, did you not? Yes.  
 8018. How far would the length of road under your control extend? From the Newtown Road to Springwood.  
 8019. You would pay all the men working on any part of that road? Yes.  
 8020. While this particular work was going on on the Parramatta Road at this culvert other works on the road were going on, I suppose? Yes.  
 8021. Upon which the same men employed upon the culvert were also engaged? No, not at all.  
 8022. Would they not be employed upon other jobs when they were not wanted at this culvert? They went on to another culvert when they had completed the Monier culvert.  
 8023. In the employment of day labour the men might be wanted upon one job on one day and they might be removed to another job on the next day? This culvert was not constructed by ordinary day labour. Mr. Smith specially engaged the men for this Monier culvert work.  
 8024. What sort of books did you keep;—were the men paid every week? Once a fortnight. I kept the ordinary set of books. We had a book relating to contracts, a book relating to cash; then there was the voucher book, in which the amounts and description of work would be noted. The system has been altered so many times that it is difficult to say under which system we were working at that particular time. We worked sometimes under one system and sometimes under another.  
 8025. But when you paid the men, what sort of receipt or statement was prepared? The ordinary voucher.  
 8026. There were several names on one voucher? Yes. The men on one special job would be put on to one voucher, the foreman being at the top and the other names following. The voucher would be signed by me. I took the signatures of the men and forwarded the receipts to the office.  
 8027. And all the vouchers that were used in connection with this job would refer to that job and that job only? The vouchers sent in in connection with that job would refer to that job only.  
 8028. *His Honor.*] Were they marked in such a way that they could be easily picked out from the rest? Yes. To the best of my recollection I wrote on all of them "Burwood Monier culvert."  
 8029. Were you anxious to keep the accounts in connection with the culvert separately? I endeavoured in my vouchers to make them as explicit as possible, so that on reference to them anyone would be able to see at once the work in connection with which they were prepared.  
 8030. Did your books show upon what work the money was expended—how much, for instance, a particular piece of work had cost? Yes, generally, because we put down the vote, and all the work done under that vote would be placed under that heading.  
 8031. What afterwards became of the vouchers? The receipted voucher would be sent to the Audit Office, and one copy would be kept in the Roads Office.  
 8032. What then are the books to which you wish to refer in order to make up these items? I want the books in which we put down the amounts of the vouchers.  
 8033. Are the vouchers bound up together? No; but all the vouchers sent in were entered in a book.  
 8034. What other books do you want? I do not know that I should want any other books.  
 8035. Then it is only this one book which you want to enable you to make up the cost of the work? Yes.  
 8036. Did you send all your books into the Department when you left? I left them with my successor.  
 8037. Your office was in Parramatta? Yes.  
 8038. Would not the books be there still? They ought to be there.  
 8039. Is there any reason that you know of for their being yet brought to Sydney? No.  
 8040. When had you the misfortune to be retrenched? On June 30th of last year.  
 8041. *Mr. Parkes.*] Are the books produced your books? Yes.  
 8042. *Mr. Gummow.*] You say you designed a circular brick culvert? Yes.  
 8043. What size was it? Two feet to the best of my recollection.  
 8044. *His Honor.*] Two feet diameter or 2 feet radius? Two feet diameter.  
 8045. *Mr. Gummow.*] Would it give the same waterway as the culvert which was put in? No.  
 8046. Can you then compare the two culverts? The culvert I recommended was sufficient for the purpose. The present culvert is about twice the size needed.  
 8047. Therefore, your superior officer made a mistake in putting it in? I do not know that he made any particular mistake, but he said he wished to try the Monier system. He said it would be cheaper, but I said it would not be.  
 8048. Had he any other reason do you suppose? I think it was a piece of folly to put in such a large culvert. There was not sufficient inlet to more than half fill it.  
 8049. What was the size of the old culvert? 1 ft. 6 in. or 2 ft., I forget which.  
 8050. *His Honor.*] Used it not to get choked occasionally? It had been choked, but that was on account of the outlet being choked. There is a good deal of bullock traffic on the road, and the bullocks had trampled the ground down over the outlet.  
 8051. Had that caused the road to overflow in heavy rains? I know that I had to put a man there several times to open it out. As I say, the bullocks had trodden the ground down.  
 8052. Almost every bit of alteration in the roadway, in the case of some suburbs, causes the rainfall, as a rule, to run off more quickly? Yes.

FRIDAY, 10 JULY, 1896.

Thomas William Bryant recalled, and further examined:—

- T. W. Bryant. 8053. *Mr. Parkes.*] Since you were last before the Commission you have perused the vouchers which have been submitted to you, and you have searched the books you used to keep when you were accountant for Mr. W. A. Smith, and you are prepared now to give further evidence with reference to the Monier culvert on the Parramatta Road at Strathfield, and also the work at Callan Park? Yes; I have looked through the vouchers, but unfortunately we have not had the papers in connection with the authorisation of the construction. We have made application to the Records Branch for them, but they say there are not

not any such papers in existence in reference to the culvert on the Parramatta Road. We have the papers, however, bearing upon the culvert at Ormond-street. There are many items which I think I could have traced, but which I have been unable to trace from the want of these papers. T. W. Bryant.  
10 July, 1896.

8054. What would be the total amount which you have been unable to trace? It would be very difficult to say.

8055. As to the vouchers or papers upon which you say the Department cannot put its hand, have you seen them before;—do you know of their existence? There are a number of vouchers, but without the original papers I cannot arrive at the amount, because some of the items of expenditure were drawn from other grants.

8056. What would the vouchers be for? For labour and for the carting of material.

8057. Before you read the statement you have made I will hand you a letter of Mr. W. A. Smith's, showing the estimated cost of a culvert of this kind? That document refers to a small culvert proposed at Ormond-street, on the Parramatta Road. They asked for £123 10s., and Mr. Hickson approved of the culvert being constructed. It was afterwards found that the money could not be spared from the main Western Road account, from which it was proposed to take the expenditure, and the matter, therefore, lapsed.

8058. Mr. Davis, in giving evidence the other day, stated that £100 was saved by the construction of the culvert at Strathfield upon the Monier system; is that correct? I know that the thing was the other way about.

8059. I presume you read Mr. Smith's evidence in the newspapers? Yes.

8060. You are aware he stated that the Monier culvert had cost £114, and that the departmental plan for a culvert in a similar position would involve an expenditure of £161? Yes.

8061. Was that statement correct? No.

8062. I hand you these vouchers, and I ask you whether you recognise them? Yes; they represent the actual payments in connection with the work.

8063. You have perused them? Yes.

8064. Are you sure these vouchers passed through your hands during the time that you were accountant to Mr. Smith? Yes.

8065. They are all vouchers in connection with the Monier culvert at Strathfield? Yes.

8066. That would be the culvert referred to by Mr. Smith in his evidence the other day? Yes.

8067. His evidence could not have referred to any other culvert? No.

8068. Will you read the details of expenditure which you have taken out of these vouchers, and afterwards give us the total? The amounts are as follows:—

Cost of Monier Culvert at Burwood, Main West Road (as per Parramatta Voucher Register).

| Voucher. |                                     | £  | s. | d. | Voucher. |  | £    | s. | d. |
|----------|-------------------------------------|----|----|----|----------|--|------|----|----|
| 189-94.  | P. Brady—wages .....                | 0  | 15 | 0  | 363-94.  | Ahern and Others—wages .....             | 17   | 4  | 1  |
| 190-94.  | M. Ahern—wages .....                | 10 | 2  | 6  | 368-94.  | Bailey—stone .....                       | 6    | 3  | 0  |
| 201-94.  | Keep & Son—bolts, &c. ....          | 0  | 10 | 5  | 373-94.  | Federal Timber Co. ....                  | 0    | 1  | 0  |
| 202-94.  | Brown and Brown—iron .....          | 0  | 15 | 4  | 375-94.  | Potts and Paul—wire .....                | 0    | 2  | 4  |

and there were two or three men working at Iron Cove some time before they began to construct the culvert at Strathfield. They had to prepare certain material, and it had to be carted from Iron Cove. The total I bring out is £238 1s. 4d.; but in regard to voucher 414, £23 0s. 11d. for Aherne and others for wages, I find that Mr. Symonds had to take two or three men away to Five Dock to do some little work there, and I give him credit for £13. That would make the total cost of the culvert £225—that is, irrespective of salaries, the cement which was taken from Iron Cove stores, and an amount for cartage. They had to cart the cement from Birkenhead to the culvert at Strathfield. Then there is the salary of Mr. Symonds, junior, for supervision.

8069. There can be no doubt that the vouchers now before you are the vouchers which passed through your hands, and to which you referred when you last gave evidence? Yes; I thought I should be able to get papers which would enable me to trace the items which were charged to the Callan Park work, but I am unable to trace that information because of the want of papers. They say the papers were never in existence, but I say they were.

8070. Have you ever had a culvert of a similar description pass through your hands at such a cost as that incurred for the Monier culvert at Strathfield? I do not remember it.

8071. Mr. Hickson wrote, on 18th July, 1894: "The Monier system of concrete arching has been patented in the Colony by Messrs. Carter & Co. Where applicable it reduces the cost of spanning an opening by about 50 per cent. The patentees are willing to allow the Department to use the patent on payment of a royalty of 15 per cent. on the cost of the arch. I recommend this for the Minister's approval. I might state I have just completed, with the permission of the patentees, a culvert on the Parramatta Road built on this principle with most satisfactory results, financially and otherwise;"—is that a correct statement of the case? From what is shown on the documents it was not correct; but I suppose Mr. Hickson would be advised by Mr. Smith that it was a correct statement. Mr. Smith, I presume, would present a report to Mr. Hickson, and upon that report Mr. Hickson would act.

- T. W. Bryant. 8072. Mr. Smith stated before His Honor that a saving of 35 per cent. was effected by the adoption of the Monier system in the case of this culvert? He is entirely wrong there. I have given you the actual facts as to the cost of the culvert. Those facts were taken from the vouchers.
- 10 July, 1896. 8073. If Mr. Davis has also stated that there was a saving of 100 per cent. by the adoption of the Monier principle in this culvert, that also would be incorrect? Yes.
8074. Instead of the Monier work being 50 per cent. cheaper it is more like 100 per cent. dearer? I should say that it is about that.
8075. *Mr. Smith.*] You say you have looked through all these papers and that you cannot find those you want? Not the papers for which I asked—that is the authority of the Minister or the Commissioner for the construction of the work. There must have been authority to construct the culvert. It could not have been constructed without authority. There is a paper showing that it was proposed to get a sum of money placed upon the estimates, but the other papers, following that, are not forthcoming.
8076. What are the papers which you expected to find, but which you have not been able to discover? The papers showing the Minister's approval or Mr. Hickson's approval to the pulling up of the old culvert and the construction of the new one—the papers showing their sanction for the expenditure of the money.
8077. You have seen all the papers which relate to the cost, have you not? I have the vouchers as far as they can be traced in the absence of the missing papers.
8078. You make the total payments amount to £238, from which you deduct £13 on account of two or three of the men being at work for a short time at Five Dock;—you make a total of £225 irrespective of cement and other material taken from Iron Cove, and the salary of Mr. Symonds, junior? Yes.
8079. I think you have said that you were a sort of general clerk to Mr. Smith? Yes.
8080. Did you go on to the works in your capacity of general clerk? No. I was a clerk in the office.
8081. Where was the office? For two years the office was in Elizabeth-street, but when the new building was completed we went into that.
8082. Where were the offices when this culvert was being built? In this building.
8083. You were not upon the work at all? No.
8084. So that the only way in which you could arrive at the conclusion that particular items were expended upon the work would be from an examination of the vouchers? Yes.
8085. Have you any idea as to how long this culvert was in course of erection—would it be weeks or months? Roughly speaking, I should say from eight to ten weeks.
8086. Were the men who were employed upon it employed during the whole of their time for that eight or ten weeks? Yes. The men were employed for the whole of their time upon the job during the whole of the eight or ten weeks. Some of them were employed considerably before that preparing for the work.
8087. But take the eight or ten weeks during which you say the men were employed upon this particular job;—could you not say what proportion of the time during that eight or ten weeks they were employed upon it? No. I think Mr. Symonds could give you that information.
8088. But can you say definitely whether the men who, you say, were paid upon this job were employed upon it during the whole of their time for the eight or ten weeks? I should take it to be so from the vouchers.
8089. As to the cement you mention in your list, £20 5s. and £16 4s. for Cullen Bullen cement;—are you prepared to swear that the whole of that cement went into the work? I should take it that it was so.
8090. But as a matter of fact you do not know how much of the cement went into the work, whether a half of it, a third of it, or a fourth of it? I could not say.
8091. Are you prepared to swear that the whole of the men engaged upon this culvert were employed upon it during the whole of the time named in the papers? No. That would not come within my province.
8092. As to Mr. Bramston, there are two vouchers showing that he received two amounts of £15 12s. for his month's salary;—are you prepared to say that the whole of his time was put in on this work? I should say so.
8093. You think the whole of Mr. Bramston's time for two months was put in on this work? I should think so.
8094. How do you arrive at that? I should think that Mr. Bramston would not be prepared to sign the voucher from which that information could be derived if it were not the case.
8095. It is only from an inspection of the vouchers that you make these statements? Yes.
8096. Supposing Mr. Smith said that Mr. Bramston was employed only eight days? That is a matter between himself and Mr. Symonds.
8097. But you do not know absolutely? No; I could not say absolutely.
8098. With regard to this period of eight or ten weeks, during which you say the work was in construction, have you any idea when it began, and when it ended? No. They were preparing for the work at Iron Cove considerably before it was actually commenced. Some of the material to be put into the work had to be prepared at Iron Cove. You will see that they carted some cement from Iron Cove, and that they afterwards began to buy cement from different firms. Then the wages commenced, and so on. Altogether, the work may be said to have been in operation long before they actually got on to the job.
8099. In the case of voucher No. 414, you have deducted £13 0s. 11d.? Yes, for work done at Five Dock. Mr. Symonds thinks the amount would not be so much as that; but I have given credit for the odd money.
8100. As to the transfer of money from the grants for Callan Park and Black Wattle—you are satisfied that part of the money voted for those works was utilised upon this culvert? I think it was. I wanted the original papers to check the amounts drawn from those grants.
8101. And you have not been able to check the amounts? No, owing to the want of the papers.
8102. As to the Callan Park grant, and as to what became of the money—do you know anything at all about it? Yes.
8103. What would the amount of the grant be? £1,000 in all; it was an advance made by Sir George Dibbs to Dr. Manning.
8104. How much of it was expended? Up to about the time I left between £800 and £900 were expended out of the £1,000.
8105. Upon that particular work at Callan Park? The Callan Park vote was operated upon for other purposes.
8106. What other purposes? Wages were drawn from it for other road works,

8107. Can you specify any item in these vouchers? I could not do so accurately unless I had the papers. T.W. Bryant.
8108. What makes you think that any of the Callan Park grant was expended in other work? I remember distinctly that it was so. 10 July, 1896.
8109. Is it not shown in the ledger-book? No.
8110. If any of the grant for Callan Park was expended upon other purposes would it not be under your supervision and control? No.
8111. Cannot you say from looking at the book which of the items was charged to Callan Park grant? No.
8112. The items to which you refer would be entered under the heading of Callan Park, and would be charged against the grant? Yes.
8113. Then, according to your evidence, those entries would be wrong? No.
8114. Some of the money represented by these entries was not expended at Callan Park, I understand? Some of it.
8115. Yet it was charged to Callan Park in that book by your direction? Yes.
8116. *His Honor.*] Do you say that amounts which were not expended upon the work at Callan Park appear under the heading of the Callan Park account? Yes. Take the entry under the name of Gilson. He may have performed a certain amount of labour at the culvert at Strathfield under Mr. Smith's directions. Mr. Smith might have gone to the culvert and found that an extra man was wanted. A man might then have been sent up at once from Callan Park. If men were wanted there, they might be sent from any place under Mr. Smith's control.
8117. *Mr. Smith.*] Do you know whether the men employed at Callan Park were employed upon the Parramatta Road culvert, or do you actually know anything at all about the matter? I could not say definitely.
8118. *His Honor.*] What makes you make the statement indefinitely? Because I know that Mr. Smith got me to send for the men.
8119. Would the whole of their time be entered against Callan Park, or would a part of their time be entered against the Strathfield work? I remember Mr. Smith telling me several times to charge the Callan Park grant for work which was done at Strathfield, and it was charged accordingly.
8120. You remember his telling you to charge it to that grant? Yes, to make out vouchers against the source from which money would be available. Perhaps the grant for one road would not be sufficient, and in such a case we should be told to draw upon the grant for another road.
8121. *Mr. Smith.*] But in the case of this particular culvert, do you distinctly remember Mr. Smith telling you to charge the wages against the Callan Park account, and did you, upon his instructions, charge that account with any work which admittedly had been done at Strathfield? Yes.
8122. Did Mr. Smith actually tell you to charge against the Callan Park account wages which had been actually earned and which were known to him to have been earned on the Strathfield culvert:—would you say that? Yes; I would say that. Aherne's case was one, and Branston's case was another. To the best of my knowledge their wages were charged afterwards to the Callan Park account. I think the same course was taken in the case of Wilson, the carter.
8123. *His Honor.*] How was Bramston paid—was he not paid a salary? He was paid by the day. I think he received 12s. a day.
8124. For supervision? Yes; over him again there would be Mr. Symonds, junr.
8125. *Mr. Smith.*] Were either of the items of £15 for Mr. Bramston charged against the Callan Park account? Yes.
8126. *His Honor.*] What I understand was done in regard to the supervision was this—Mr. Bramston was there to superintend the men; Mr. Symonds, junr., was there to superintend Mr. Bramston; Mr. Symonds, senr., was there to superintend Mr. Symonds, junr.; and Mr. Smith was there to superintend Mr. Symonds, senr.? Yes.
8127. *Mr. Smith.*] That is your evidence as to the way in which the work was carried out? Yes.
8128. As to the Callan Park grant—do you or do you not know that the whole of it, with the exception of £227, was expended at Callan Park;—if that statement were made, would you be prepared to contradict it? All I can say from my knowledge obtained from drawing the vouchers is that some of the labour charged to that account was performed at other places.
8129. The balance of £227 was unexpended and was written off? Yes, I believe so.
8130. As to the grant for work at Blackwattle—what do you know about that? Some items were charged against that in the way of wages. I think, roughly speaking, that the grant was £80. I am only speaking from memory. My mind is to some extent in the dark until I see the papers.
8131. Was any part of the grant spent on work other than that at Blackwattle? Yes; I think that in the case of one or two items it was.
8132. What sort of items would they be? Wages, I should think.
8133. I think you said when you were last examined that the Department had to send for you after you had left to adjust Mr. Smith's accounts? Yes.
8134. Is it the fact that you did so? Yes.
8135. Do you say that you really adjusted the accounts? Yes.
8136. What do you mean by that? Certain items had to be put right, because the accounts would not balance.
8137. Do you remember what they related to? To Mr. Smith's deposit account.
8138. Was there nothing else? Nothing else among the items.
8139. Do you remember one item of £7 12s.? I do not know.
8140. Was not that the only item? There were a lot of matters to be attended to.
8141. Was it not a fact that there was only this item of £7 12s. which ought to have been brought into Mr. Smith's banking account and which was not there? I do not know what the amount was now, but I afterwards adjusted it at the bank.
8142. Was not that the only item you had to adjust? I could not say.
8143. Think a moment? I could not say.
8144. You are not able to say whether or not there was any item besides that £7 12s.? I could not say. I know they were mixed up as regards his balance.
8145. Do you know what the item of £7 12s. was? No.

- T. W. Bryant. 8146. Was it not a cheque of Meeks and Wheeler, which they had sent in as a deposit? I remember that there were some of the items in the deposit account which they could not work out.
- 10 July, 1896. 8147. But I want you to keep for the present to this one item;—was it not a cheque of Meeks and Wheeler? I could not say.
8148. Was it not a cheque paid in by a firm of contractors as a deposit, and which ought to have appeared in Mr. Smith's Banking account containing the deposits? I believe that was it; but one would imagine from your question that I had been in the service up to the present moment. It is impossible to remember all these things.
8149. I want you to fix your mind upon this one item? I have been entirely away from the service and it is difficult for me to do so.
8150. How was the matter cleared up? I cleared it up through the Bank.
8151. In what way? By going to the Bank.
8152. What was the explanation? I remember that there was one item in particular which was entered wrongly. It was entered to a firm of the same name.
8153. Instead of being entered to Mr. Smith's account? Yes. That is how that item was found.
8154. Is that not the whole history of the matter—that this cheque of Meeks and Wheeler for £7 12s., paid to Mr. Smith as a deposit, did not appear in his Banking account? I could not say.
8155. Is it not a fact that, as you had been in charge, you were called upon to explain the matter, and that, after going into it with the Bank, it was found that this cheque of £7 12s., through an error on the part of the Bank, had been paid into the account of another Smith? The explanation of one of the items was something like that.
8156. Is not that the whole history of the matter? No.
8157. Was there anything beside that you had to put right? I could not say.
8158. But, speaking from your memory, is there anything beyond that item you were called back to deal with? I could not say definitely.
8159. You said on a former occasion that the Department had called you back to adjust Mr. Smith's accounts? Yes.
8160. And you thought that a truthful way of giving your evidence? Yes.
8161. Mr. Symonds, senior, I believe, paid the whole of the men upon his portion of the Main Western Road? I think he made the bulk of the payments.
8162. How far does the portion of the Main Western Road, over which Mr. Symonds, senior, had control, extend? From the Glebe to the Blue Mountains.
8163. *Mr. Gummow.*] What was your ledger for;—what was it intended to show? It is an account kept for the information of the engineer of the district.
8164. Is it not supposed to be a proper record of where the money is expended? No.
8165. Take the case of the culvert at Strathfield of which we have been speaking? A great proportion of the expenditure was operated upon by Mr. Symonds of Parramatta, who also kept a ledger. Mr. Smith had drawn for the work, and an account was kept of that at the other end. If I am not mistaken he drew £16 odd.
8166. *His Honor.*] But that is not an answer to Mr. Gummow's question as to the meaning and object of the ledger? It was for Mr. Smith's information.
8167. Take the culvert at Strathfield as an illustration;—were the entries made in the ledger supposed to be the whole of the charges against that culvert? They were supposed to be; but in the meantime Mr. Smith changed his mind and handed it over to Mr. Symonds at Parramatta.
8168. Then this ledger would show only part of the account, and the rest would be shown in Mr. Symond's book? Yes.
8169. Is Mr. Symond's book ever amalgamated with this book;—are not the credits and debits entered finally in one book to show what the whole expenditure upon the work has been? They are supposed to be amalgamated at the head office, under Mr. Carroll.
8170. Would the account in that office show distinctly the headings of the different works as they are shown here? That would all depend upon the grants; their entries would be entirely different from ours.
8171. Under the grants do you mean? Under different votes or grants. There is what you would call a liability-sheet. They do not keep their accounts together; they split up the amounts of different grants.
8172. *Mr. Gummow.*] You said that some money which had been expended upon this culvert at Strathfield had been entered under another heading? Yes, I think so, as far as my memory serves me.
8173. Is it of any use at all to keep books if that is the state of affairs? I have already explained that this book is kept for Mr. Smith's information, so that he may know how he is spending the money.
8174. But what is the good of the book if it does not show where the money is spent? I think that is a matter Mr. Smith should explain.
8175. What I want to know is of what use are the books if they do not explain where the money is expended;—would it not be better to have no books at all than to have books containing statements which are entirely untrue? As far as this book is concerned Mr. Smith had it kept to show the amount of money at his command in connection with the employment of labour and the completion of contracts. The distribution of the money is a matter entirely within his own control.
8176. Should not the book show where the money was expended? It should do so.
8177. And would it not be better to have no book at all than to have a book showing mis-statements? I could not say.
8178. But I want to know your opinion? If I kept a set of books I should like the items which appear to represent exact facts.
8179. Suppose that in the case of this book they do not appear as exact facts? I am not here to explain that.
8180. As to this Monier culvert at Strathfield, you say that it cost a good deal more money than another class of culvert which could have been put in would have cost? I cannot speak as to that. I know that it has cost double the amount which Mr. Smith says it has cost.
8181. *Mr. Smith.*] When you were last examined you said that the head of the Department might recommend an expenditure of, say, £115 or £120 for a job, and that you were supposed to keep within that amount, but that if when you got on to a work you found that an extra expenditure was required, then if Mr. Smith thought it not prudent to ask the Minister for more money, then the money required was taken from some other grant. I should like to know how often that happened? It was the usual thing during all the time I was with Mr. Smith.
- 8182.

T. W. Bryant.  
10 July, 1896.

8182. Do you say it was the usual thing? Yes.
8183. Can you mention any other job with the exception of those of which you have been speaking this morning in which it was done? No.
8184. Could you mention any one job besides those where this thing was done? I cannot; but I am confident that Mr. Symonds will bear me out as to the practice. I have known Mr. Symonds and Mr. Smith to have disputes over this very thing. I remember, for instance, that Mr. Symonds objected to the money required for the culvert at Ormond-street being taken from the Main Western Road grant. He wanted a special grant from the Minister for the work.
8185. *His Honor.*] What I understand is this, that Mr. Symonds wanted the money spent upon the ordinary work of maintenance, and not upon any particular new work? That is so.
8186. *Mr. Smith.*] Can you remember any other case in which what you call the usual thing was done? I could not say at this moment.
8187. How long were you there? About four years.
8188. And was it the usual thing during the whole of that time? Yes.
8189. How often, speaking roughly, would it be likely to have occurred during that time? It was done so often that I could not say.
8190. *Mr. Parkes.*] When you transferred items of expenditure from one work to the cost of another, did you do so upon any definite instructions? Yes, from Mr. Smith.
8191. In that matter you always acted under his instructions, did you? Yes.
8192. What were you paid by the Department when you came back to adjust Mr. Smith's accounts? It occupied me three or four days, and I think I was paid about £2.
8193. You would not be likely to be paid that amount for making a search at a bank for this one amount;—did you not do any more work? I had a lot of running about during the two or three days. I found it very difficult to get the information.
8194. Did you receive a letter of testimonial from the Department when you left? Yes. I referred to it a day or two ago when I was examined here.
8195. You received a letter expressing approval of your conduct during the time you were in the Department? Yes.
8196. Suppose you had the necessary books and the opportunity to make a search, could you find other cases where Mr. Smith took money from one work and expended it on another? It could not be got at easily. The thing would have to be done in his own office. The accountant would object to the doing of such a thing.
8197. But if it were done, could it be found out? No, not easily; the amount might be charged to the Main Southern or the Main Western Road.
8198. Suppose you made a search, could you find these cases? I do not think I could; but Mr. Symonds will bear me out when I say that there have been disputes between himself and Mr. Smith over this very point.
8199. Does your difficulty arise from the impossibility of discovering the vouchers? It is almost impossible to hunt up all the necessary papers.
8200. Once papers are done with in the office they seem to be lost for ever? They go out of sight. I know that Mr. Symonds on more than one occasion complained that Mr. Smith was taking money from his road grant. When Mr. Symonds was prepared to advertise for certain work to be done on a particular road, it was found, in some cases, that a half or a fourth of the money had been used. I have known cases in which he has spoken to Mr. Smith about that.
8201. *His Honor.*] Do you mean that this money was used upon other roads or for some special purpose upon your own road? Mr. Smith used it in his own district, and I remember Mr. Symonds complaining of it on one or two occasions.

James Symonds re-called and further examined:—

8202. *Mr. Parkes.*] You have made a search among the papers referring to the Strathfield culvert? Yes. *J. Symonds.*
8203. Have you completed your search? Yes.
8204. And have you obtained all the papers you require? All that I need, I think. *10 July, 1896.*
8205. You recollect the culvert being built upon the Monier principle? Yes.
8206. You were engineer for a portion of the Main Western Road at that time? Yes.
8207. Was it your duty to pay the men? Yes.
8208. Did you pay away all the money by voucher? Yes; I think so.
8209. Did all the vouchers in connection with that work pass through your hands? Not quite all. Mr. Smith proceeded in that in the first place, independently of me, but he afterwards handed over the work to my supervision.
8210. Are those vouchers before you those which you picked out yesterday as having reference to the work? Yes; they are the vouchers. Nos. 191, 220, and 208, represent material for which Mr. Smith paid before handing the work over to me.
8211. After that did the remainder of the vouchers pass through your hands? Yes.
8212. And can you swear positively that all the money set forth in these vouchers was expended upon that particular culvert? It was, with the exception of one, which I made a note of. It had to do with the construction of a small pipe culvert. It was carried out at the conclusion of this work, and I have allowed £13 for it.
8213. What is the total expenditure upon this Monier culvert according to the vouchers? £238 1s. 4d.
8214. Does that include all the expenditure you know of? I am not certain that it includes all the expenditure. I have been informed that a certain amount of cement was taken for the work from the Iron Cove store prior to my having anything to do with the matter.
8215. Therefore, if Mr. Smith represented to His Honor that the culvert cost only £114 that statement was not correct? It was not correct.
8216. Did you see the report of Mr. Smith's evidence in the newspapers? Yes.
8217. Did you write to him? Yes. I wrote to him asking him to amend his statement.
8218. *His Honor.*] Did you keep a copy of the letter? No; but I can remember the effect of it. I told him that I had noticed his statement before the Commission. I told him that he had made a mistake, and I recommended him to amend it, or I said that I might be tempted to proffer evidence on the point.

8219.

- J. Symonds. 8219. How long was it after you saw the report of Mr. Smith's evidence that you wrote that letter? Two days afterwards, I think. It was written on Saturday last.
- 10 July, 1896. 8220. Have you received an answer? I have not.
8221. *Mr. Parkes.*] Did you expect that Mr. Smith would come forward and amend his evidence? I thought that when it was pointed out to him that he had made a mistake he might amend it.
8222. Will you look at that document and tell me whether you have seen it before? Yes; it is an estimate which I sent in on 17th August, 1883, as to dangerous culverts on the Main Western Road between Sydney and Parramatta. I said: "There still exist on the above length of road dangerous culverts which at various times have been reported as unsafe or inefficient. No. 1, near Ormond-street, Ashfield—a new culvert required; No. 2, at Wentworth Road, Burwood—a new culvert required; No. 3, at Auburn—a new culvert required. As each of these culverts should be in brick or concrete work, and requires to be about 60 feet in length, a sum of not less than £500 will be required." I may mention that both the other culverts mentioned in the recommendations are bigger than the culvert at Wentworth Road.
8223. The £500 was intended to cover the expenditure upon the three culverts? Yes.
8224. If Mr. Davis or Mr. Smith has said that you sent in a report that £300 was required to cover the cost of the culvert at Wentworth Road, that is incorrect? Yes.
8225. What was the proportion of the £500 which you proposed to expend upon that culvert? I think I made an estimate that an expenditure of about £110 would be required at that place.
8226. That was for a circular brick culvert? Yes.
8227. Suppose another method of construction had been adopted—suppose the culvert had been 5 feet in width with 9-inch brickwork over it, and with stone abutments, would it have cost as much as £256? I do not think it would. I have not made an estimate.
8228. Would it have cost much more than the circular culvert you proposed? Yes; it would cost about double what I put down. I suppose it would have cost about £200; but there was no necessity for that size of culvert.
8229. Comparing the Monier culvert with a culvert such as I have described, would there have been a saving of 50 per cent. by the adoption of the Monier culvert? I could not say. I told Mr. Smith that I did not think there would be any saving by adopting the Monier system. I said I could not see where the saving would come in.
8230. Supposing the culvert had been covered with buckle plates, would it not have been a great deal cheaper? It was not recommended, because there was no necessity for such a culvert.
8231. What would a buckle plate culvert have cost? Judging from the culverts we have constructed in other places, I should say that it would have cost £150 or £160.
8232. Have you on any occasion taken money from the account of one work and placed it to the credit of another? I do not say that such a thing has never been done. For instance, supposing a bridge were being constructed on the Main Western Road, and that I had a special sum for it, if the sum did not quite cover the expenditure I might take the remainder out of the Road Vote. That is what is usually done.
8233. Do you know whether, as a matter of fact, any of the expenditure upon the Monier culvert at Strathfield was taken from the Callan Park grant? I do not know about that.
8234. Were the whole of the vouchers paid from the Main Western Road account? With the exception of the three vouchers to which I have already referred.
8235. Was the Strathfield culvert built out of the Vote for the Main Western Road? I believe it was paid for out of a Special Vote of £10,000 given by the Secretary for Works for relief works.
8236. Where were these relief works to be constructed? Partly on the Main Western Road. I think £2,000 was allotted to me for works upon the Main Western Road.
8237. Are you sure that, with the exception of the three vouchers you have named, the rest of the vouchers in connection with the Strathfield culvert were paid for out of the Main Western Road Vote? They were. A sum of money intended especially for relief works was granted for the road, and that was put with the expenditure upon the Main Western Road. The two things were made into one account.
8238. Would that include the Callan Park work? No.
8239. Was any of the work in connection with the Strathfield culvert paid for out of the Callan Park grant? I do not know that it was.
8240. Was any material for this work paid for from the Callan Park grant? Not that I am aware of.
8241. Could you swear that it was not so? I have no reason to suppose that it was so, apart from the question of the cement which was supplied from the Iron Cove store. That might have been paid for from the Callan Park grant.
8242. Is there any voucher for that cement;—were all the vouchers for the payment of wages to the men employed upon the culvert? There were two vouchers for cement, but that was for the supply of cement before the work came to me.
8243. Were all the vouchers charged against the Main Western Road Vote? With the exception of those showing that Mr. Smith paid a carpenter £2 2s. for making a centering, and that he had paid for other material.
8244. Were the wages in any of these vouchers charged against the Callan Park grant? I do not know that they were.
8245. Are you in a position to say whether they were or not? According to the vouchers they were not.
8246. Would the vouchers indicate where the money was paid from? I am certain they were paid from the Main Western Road Vote, because they came into our books.
8247. Was it ever your practice to take money from one work for use upon another;—for instance, suppose you had a bridge to build in one position, and another bridge to build in another position, would you adjust their cost by taking money from one Vote and expending it in connection with the other work? No; I do not know that I ever did that. It has only been done in the way I have suggested. If there were two bridges on one road, and if I had a balance in respect of one bridge, I might possibly spend it on the other bridge if it were required.
8248. Is the maintenance money voted annually for the Main Western Road supposed to go to the construction of a new work such as a new culvert or a new bridge? It is supposed to include small works, but not large ones. We generally ask for a special sum for anything over £200.
8249. When you have obtained such amounts, have you taken the money from one vote to provide what has been necessary in connection with another? Yes; in the way I have explained. 8250.

8250. Supposing £500 were voted for a bridge somewhere and that the bridge were found to cost £1,000, would you take the extra money from the ordinary road vote? No; in such a case a further grant would be asked for. Possibly a sum of £100, or so, might be taken from the ordinary road vote under special circumstances, but it would not be a greater sum than that. J. Symonds.  
10 July, 1896.

8251. *His Honor.*] Have you had occasion to expostulate with Mr. Smith on this very point—the transference of money from one vote to another? No; but I have sometimes been very much vexed about it. I remember that in one case a certain number of men were employed in the Sydney district and were paid from my money for the Windsor Road, 20 or 30 miles distant.

8252. Up to what amount, roughly? I suppose £30 or £40.

8253. Was that the only occasion, or have there been other occasions? There have been other occasions, but I cannot call them to mind just now. I know I complained at the time of their operating upon my vote. I thought it was very unfair.

8254. Can you say, roughly, how many times this sort of thing has happened? The thing has been done many times, and I have known nothing about it. They have charged works against the main Western and main Southern roads, and I have known nothing of it.

8255. Did you expostulate with Mr. Smith on those occasions? I did expostulate with him. I said that I could not keep my accounts straight if money were spent in this way without my knowledge.

8256. Can you give us an idea of the largest amount transferred in this way in one lump sum? I have kept no special account of it. With regard to the Windsor Road matter, I know that when that took place I pointed out that men who were employed in Sydney certainly ought not to be paid from a country road vote. I thought it very unfair that the vote for the road from Parramatta to Windsor should be trenched upon in order to clear up accounts in Sydney.

8257. Can you not give us an idea approximately as to how often that sort of thing has occurred to your own knowledge? I could not say exactly. It will be a long time back now, and I kept no record of these matters.

8258. Would it have happened half a dozen times, or less? It would have happened a greater number of times than that.

8259. Would it have happened a dozen times? I dare say it would.

8260. Would it have happened more than a dozen times? I cannot distinctly recollect a dozen cases, but I know that the question often arose.

8261. Had the practice ceased shortly before you left the Department, or was it then continuing? I did not complain so often about it during the latter part of my term.

8262. For how many years or months was it before you left during which you had not cause to complain? I do not think I had any cause to complain during the last year of my service. They seemed to imagine in Sydney that they could do as they liked with our vote.

8263. As to this Monier work—can you say whether any men were actually employed upon that culvert whose names do not appear in the vouchers charged against that particular work? I am not aware of it being done after the work came under my direct supervision. If the men were paid from any other vote or grant it would be at the commencement of the work, when Mr. Smith was superintending it independently of me.

8264. Would it be possible for men to be sent over from Callan Park, or from some other work, to do work upon this culvert for a day or two, and then for their wages not to appear at all in connection with the culvert accounts? I do not think that happened.

8265. You do not think that any men were put on to work at the culvert who were regularly employed at another place? I think I should have noticed that had it been done.

8266. I suppose each man's time was kept? Yes; my son kept the time and made up the vouchers, and I paid the men.

8267. I suppose that if your son had been directed not to keep the men's time he would not have done so. Suppose, for instance, he had been told not to keep the time of men who had come on to the work from some other work for a period of two or three days? He would be working under Mr. Smith, and if Mr. Smith directed him to do such a thing he would probably obey his orders; but I do not think such a thing happened.

8268. It did not happen to your knowledge? No.

8269. *Mr. Parkes.*] Where is your son now? He is assistant engineer at Stroud under Mr. Allman.

8270. *Mr. Smith.*] As to these vouchers;—you say you have been through them thoroughly, and that the amount expended in connection with this Monier culvert comes out at £238? Yes.

8271. Do you say that the whole of that amount, with the exception of £13, was properly chargeable against the construction of the Monier culvert? Yes.

8272. You mean, I suppose, against the whole affair, including the removal of the old structure? Yes.

8273. As to the cement;—do you say that the whole of the cement appearing in these vouchers was put into the work? I might state that in going through the papers I noticed that about five casks of cement were sent to the Iron Cove store. Excepting that five casks of cement, the other was used on the works to the best of my knowledge.

8274. Now, with reference to the day labour—how long was the work in construction? About six or eight weeks.

8275. Were the whole of the men on it working there the whole of their time during that period? Yes; they were engaged on that work. They were not sent anywhere else to work.

8276. They would not be employed on any other work? They were not employed anywhere else until they had finished, when they were sent to do a small work at Five Dock.

8277. As to Mr. Bramston, he received a salary and was paid monthly? Yes.

8278. And you think that the whole of that two months' salary should be charged against this work? I think so.

8279. Was he doing anything else at the time besides the superintendence of this work? I cannot say. It is possible that he might have been.

8280. Had he other duties? I do not think he had any other work in hand when this culvert was being constructed.

8281. But do you know whether he had or not? He was there whenever I went to the work.

8282. Did you go there every day? No; sometimes twice, and sometimes three times a week.

- J. Symonds. 8283. With regard to the estimates for several culverts to which you have referred, No. 2 would be the work at Strathfield to which we have been referring? Yes.
- 10 July, 1896. 8284. How did you arrive at your estimate of £500 for the three works? I made an estimate for each culvert, and put the three sums together.
8285. What did you put down for No. 1 culvert at Ormond-street, Ashfield? It is difficult to say. I have no data before me.
8286. What did you put down for No. 3? I think it was £160.
8287. And for No. 2? I think it was £110.
8288. Therefore, No. 1 would absorb the balance of the £500? Yes. But I may mention that both No. 1 and No. 3 are larger culverts than the one at Strathfield.
8289. Still you would have £230 left for No. 1? Yes. In making up these estimates it is usual to allow a margin. There are often other matters which crop up. For instance, there is the removal of water-mains and other matters which cannot be foreseen.
8290. You think that £230 left margin enough in the case of No. 1? Yes.
8291. Did you discuss this matter with Mr. Smith before you sent your estimate in? I do not remember doing it.
8292. Did you not some two years before recommend an expenditure of £350 for No. 1 culvert? Not to my knowledge.
8293. You will see that in the document which I now hand you you recommend the expenditure of that amount? Yes.
8294. *His Honor.*] In what year was that? 1892.
8295. *Mr. Parkes.*] What were the dimensions of the culvert? There was a 4-ft. span with 66 feet of roadway, with a buckle-plate top. It is quite possible that in that case I allowed for the removal of water-mains. We knew from our experience that they would have to be lowered. I know that in one case it cost us some hundreds of pounds to lower the mains.
8296. *Mr. Smith.*] You wrote this minute on 4th May, 1892, recommending that £350 be expended on culvert No. 1? Yes; but, as I have explained, a good deal of that would be for the lowering of the water-mains.
8297. *His Honor.*] You had to provide for that? Yes. I remember that in another case, where a culvert was put in, it cost us more to lower the mains than for the culvert itself.
8298. *Mr. Smith.*] Did you take that into consideration when you wrote your minute of 17th August, 1893? Probably.
8299. How did you come to drop from £350 to £230 in the eighteen months? The price of nearly all classes of work had dropped very much. When I left the Department we were doing some kinds of work 50 per cent. lower than the price at which we had been doing it in former years.
8300. *Mr. Parkes.*] Competition had become greater? Yes.
8301. *Mr. Smith.*] As to this transfer of money from one account to another—if you had not enough money in one of your votes, did you ever get any money from another vote;—do you remember doing that? Only in a small way in the last months of the year. For instance, if I had not enough to pay wages on the Main Western Road, and I had a balance on the Main Southern Road, I would borrow the money and pay it back in some future month. I kept my accounts as strictly as it was possible to do so.
8302. When you expostulated with Mr. Smith on the occasion to which you have referred, what did Mr. Smith say? I do not know that he made any reply.
8303. Was any adjustment of the accounts made? No.
8304. Did you state your objection in the form of a minute? I will not be certain that I mentioned it to Mr. Smith directly, but I mentioned it to Mr. Bryant, who was making out the vouchers for him. I remember saying to him, “You have been taking my funds.”
8305. And what did he say? He laughed at that.
8306. *Mr. Gummow.*] I think you have spoken of a brick culvert double the size of the old one;—you mean a culvert with a 4-ft. diameter? Yes.
8307. And that you thought would cost about £220? Yes.
8308. Do you know what a brick culvert having the same waterway as the Monier culvert at Strathfield would cost? I have not gone into that matter.
8309. You could not tell whether it would cost more than £220? Probably it would.
8310. I mean with the same waterway as the present culvert? I should not have put in a brick culvert of that capacity, because it would not be necessary.
8311. How much would a culvert with the same waterway as the present culvert cost;—that is what we want to get at? About the same, I think.
8312. Do you know if you could put in a circular brick culvert with the same waterway as the present culvert? No; I do not think there would be room for it. We might put it in, but it would cost a good deal for the deepening of the watercourse. I do not know whether we could get the fall for the water.
8313. Therefore, that may be left out of the question? Yes.
8314. With regard to the buckle-plates—what is the average life of a buckle-plate? It used to be considered a century.
8315. At that rate they are as durable as the Monier system? I presume so.
8316. *Mr. Parkes.*] If you had built a culvert at Strathfield with 9-inch brickwork instead of on the Monier system, would there have been a saving in that particular case? A 9-inch brick arch would have been cheaper than the Monier arch.
8317. Much cheaper? Considerably cheaper.
8318. The cheapness of the Monier arch comes in in the extent which it spans, does it not;—in a small work such as a culvert it would be more costly, would it not? It might be cheaper with a greater span.
8319. Do you know what the Monier arch in the Strathfield culvert cost apart from the other portions of the work? I have not gone into that.
8320. Do you think it cost £90? I have no separate records at all.
8321. What would you generally allow for brickwork of that kind? Thirty-five shillings a cubic yard generally.
8322. Then if the Monier arch work costs £4 10s. a cubic yard it would be much cheaper to put in an arch of brick? Yes; brickwork would be cheaper than the Monier system.

8323. Taking a Monier arch  $4\frac{1}{2}$  inches thick at £4 10s. a cubic yard it would be dearer than 9-inch brick-work at 35s. a cubic yard? Yes. J. Symonds.  
10 July, 1896.
8324. You think then that it would have been cheaper in this particular case to build a brick arch? Yes. I pointed out to Mr. Smith that there was no saving in what he proposed to do. He said he hoped there would be a good deal of saving, but I told him the Monier work would not be cheaper, and that it would cost more.
8325. Would not a brick arch be more substantial? It would have been quite as good.
8326. *His Honor.*] As to the size of the culvert and the necessity for a large one—do you know whether the former culvert had frequently become choked in times of heavy rain? That was not on account of the size of the culvert, but on account of the bullocks treading in the outlet.
8327. Was that the only reason? That, I think, was the only reason.
8328. Could not the outlet have been deepened? You might deepen it one day, but in the evening a mob of bullocks would come along and the outlet would be trodden in again.
8329. A barrel culvert would not have crossed the whole of the road? It would cross the formation and one footpath.
8330. On the other side there would be a hollow, I suppose, through which the cattle would pass? There was a piece of vacant land and the cattle used to run round that way.
8331. I suppose the ground is now very much more built upon than it was, yet you say that it is not a proper thing to put in a culvert of the size which was put in? I do not think it was necessary, because a 2-ft. diameter culvert would have taken the water.
8332. Have you measured the area and calculated out the probable discharge? No; but I know that it was not large.
8333. You have not gone into the question specially. You have considered it only in a general way, and it appears to you that a 2-ft. diameter culvert would have been big enough? In these matters I generally take a general view of the country; I find I am usually correct as to the size of the culverts put in.
8334. Has not your experience been that nearly every culvert on your roads has had to be enlarged? No. In some cases we have taken out a comparatively large culvert and have put in a 1-ft. 6-in. pipe, because it has been found sufficient. Some of the earlier bridges and culverts were put in without any regard whatever to requirements.
8335. *Mr. Smith.*] You said you put down the Ormond-street culvert at £230, and that you put down the Wentworth road culvert at £110,—is that so? Yes.
8336. I believe the Ormond-street culvert was 66 feet in length with a span of 4 feet? Yes.
8337. And the Wentworth road culvert was 55 feet in length with a span of 5 feet? Not according to my plans, which were for a 2-ft barrel drain.
8338. What had you in your mind as to the new culvert, if it were to cost only £110? I had in view a 2-ft. barrel drain, and to prove that that was sufficient, I may mention that Mr. Smith himself made provision for four 9-in. pipes leading down into the culvert.
8339. So that it was a smaller work? I said "What is the good of putting in a large culvert of that size and then putting these small pipes into it?"
8340. *His Honor.*] Where were the four 9-in. pipes to come in? They would lead the water from the water-tables into the culvert.
8341. And would that be the whole of the discharge the culvert would have to carry? Yes. I think that finally it was constructed with only 12-in. inlets.
8342. *Mr. Smith.*] If it were necessary to have a culvert of the size which is now there, what would have been your estimate of the cost? I do not know. I never made an estimate.
8343. Would there have been much difference between your estimate for a culvert of the size which was constructed and the No. 1 culvert in your recommendation? It would probably have been about the same price, supposing such a culvert to have been necessary.

George Christie recalled and further examined:—

8344. *Mr. Parkes.*] You have read the evidence given by Mr. Carter with reference to his business transactions with various officers of the Department, and I will ask you now to read the report which you have handed to me concerning the transactions of Mr. Carter with Mr. Weedon. I think Mr. Carter said the transaction was one of a private nature, whereas your researches have shown that it was a transaction with the firm;—is that not so? I have here a statement of certain facts, and I shall be pleased to answer questions as to what might be inferred from those facts. G. Christie.  
10 July, 1896.
8345. Will you read the statement? Yes.

MEMO. No. 3.

*Re* financial dealings of Messrs. Carter, Gummow, & Co., with Mr. S. H. Weedon, Government Resident Engineer, Sewerage Construction Department; and as to payments of interest.

(a) In the documents furnished by the Bank of New Zealand, in connection with Messrs. Carter, Gummow, & Co.'s account with that Bank, information was disclosed showing that a cheque of Mr. Stephen H. Weedon, for £2,000, had been paid in to the credit of the contractors on the 18th June, 1895.

Following upon that information I have made certain investigations and inquiries, particularly at the English, Scottish, and Australian Bank, where Mr. Weedon has his banking account, and am now able to state as follows:—

1. The identical cheque for £2,000 which had been paid into Carter, Gummow, and Co.'s account with the Bank of New Zealand was debited against Mr. Weedon's account with the English, Scottish, and Australian Bank on the 19th June, 1895, the cheque itself being dated the 17th June, 1895.
2. On the 1st of August, 1895, the balance at the credit of Mr. Weedon in the aforesaid banking account was under the sum of £50. On the 2nd May, 1895, the sum of £1,000 was placed to his credit, and on the 27th May, 1895, a second sum of £1,000 was also placed to his credit. This £2,000 represented money which was due to Mr. Weedon personally from Brisbane.
3. After the cheque for £2,000 which had been paid to Messrs. Carter, Gummow, and Co., was charged to Mr. Weedon's account, the balance was less than £50 to his credit.

(b)

G. Christie.  
10 July, 1896. (b) I have also in this connection specially examined the accounts with the Bank of New Zealand in the names of Carter & Co. and Carter, Gummow, & Co., as disclosed by the pass-books, and the cheques and other vouchers which have been obtained from the Bank, and find the following.—

The balances of these accounts were on the 31st March, 30th June, and 30th September, 1895, as follows, viz. :—

|   |             | £      | s.    | d.  |
|---|-------------|--------|-------|-----|
| 1895.   |             |        |       |     |
| 31st March.—Carter, Gummow, & Co., credit           |             |        | 3,709 | 7 2 |
| Carter & Co., debit.                                |             | 6,781  | 17    | 1   |
|   | Net debit   | £3,072 | 9     | 11  |
| 30th June (after Weedon's £2,000 had been paid in). |             |        |       |     |

| Carter & Co., debit                                 |             | 1,507  | 12    | 9   |
|   | Total debit | £3,058 | 10    | 8   |
| 30 September.—Carter, Gummow, & Co., debit          |             |        |       |     |
| Carter & Co., debit                                 |             | 4,067  | 5     | 11  |
|   |             | 606    | 19    | 4   |
|   | Total debit | £4,674 | 5     | 3   |

During this period, from 31st March to 30th September, 1895, there are certain deposits of money from sources outside of their Sydney contracts, such as—

|  |  | £     | s. | d. |
|--|--|-------|----|----|
| <i>In</i> Carter, Gummow, & Co.'s account.                         |  |       |    |    |
| From Adelaide during the three months ending 30th June             |  | 1,804 | 4  | 1  |
| From S. H. Weedon, 18th June, 1895                                 |  | 2,000 | 0  | 0  |
| Transfer from Carter & Co., North Shore account, 26th August, 1895 |  | 2,000 | 0  | 0  |
| <i>In</i> Carter & Co.'s Account.                                  |  |       |    |    |
| From Billyard, Andrews, and Moseley, 10th April, 1895              |  | 4,500 | 0  | 0  |

During the period under review the contractors had to make very heavy payments for purchases of material and to provide for certain payments out of capital for retiring partners, and also to provide for similar heavy claims in the months immediately following.

Certain payments might be mentioned, such as the following :—

|                                     | £     | s. | d. |
|-------------------------------------|-------|----|----|
| Maddison (retiring partner)         | 2,780 | 0  | 0  |
| Ewing                               | 2,250 | 0  | 0  |
| Mort's Dock and Engineering Company | 3,468 | 2  | 7  |
| Parbury, Henty, & Co.               | 2,946 | 16 | 10 |
| Scoutton, R. L.                     | 649   | 10 | 0  |
| Fuller and Sons                     | 400   | 0  | 0  |
| Hervey                              | 395   | 16 | 8  |
| Deposit on Contract 77 (29th April) | 775   | 0  | 0  |
| „ „ (6th June)                      | 605   | 0  | 0  |

It might also be mentioned that on the 8th March, 1895, the sum of £3,500 was paid, through Messrs Billyard, Andrews, and Moseley, to retire the mortgage for that amount with a view of borrowing an additional £1,000, as shown by the deposit of £4,500 on 10th April, 1895.

(c) Messrs. Carter, Gummow, & Co., appear to have paid Mr. Weedon the interest on this £2,000 at the rate of £30 per quarter. The first payment appears to have been made by a cheque, drawn by Messrs. Carter, Gummow, & Co., dated October 1st, 1895, payable to "Cash," amount £30. The second quarterly payment of £30 was by that firm's cheque, dated 16th January, 1896, payable to "Interest." The first of these cheques appears to have been cashed in large notes, and the second one to have been paid into the credit of Mr. Weedon with the English, Scottish, and Australian Bank. I have not as yet identified the further payments to Mr. Weedon by Messrs. Carter, Gummow, & Co. I have carefully examined the Bank Pass-book of Mr. John Carter, who has drawn his cheques in favour of names, and have not discovered any payment to Mr. Weedon therein, nor is there an amount corresponding with a quarter's or two quarters' interest during the six months ending 30th June, 1896.

(d) My investigation of the accounts also shows that the whole of the payments for interest on the loans per Messrs. Billyard, Andrews, and Moseley, of £3,500, subsequently £4,500, extending from March, 1893, to April, 1896, were paid out of the accounts of the firms of Carter & Co., and Carter, Gummow, & Co.

GEO. CHRISTIE,  
F.S.A.A.

Sydney, 10th July, 1896.

8346. There can be no doubt in your mind from your investigations that the money of Mr. Weedon was used for the purposes of the firm, whereas Mr. Carter said that it was advanced upon his own security for his own purposes? The transaction shows that the money went direct to the firm's account, and the state of their banking account shows that the money was necessary—that they really required it. I inferred from Mr. Carter's answers to the questions he was asked the other day that he considered the transaction a private one. I think he said he gave personal security.

8347. Have you examined the transactions of Mr. Carter with Mr. Rudolph and Mr. O'Hanlon? I have the original records as to the searches I made in those matters.

8348. Are the loans in those cases from the firm, or from Mr. Carter as a private individual? The payments to Mr. Rudolph are by the firm. There is a cheque of April 19th, 1892, drawn in favour of Henry Rudolph for £250 upon Carter & Co.'s North Shore contract account, and a cheque under date of 26th May, 1894, drawn in favour of Henry Rudolph for £40 upon the account of Carter, Gummow, & Co., Contract 69. I have also papers which show that four of Mr. Rudolph's salary cheques were paid into the credit of Messrs. Carter, Gummow, & Co.

8349. Therefore the transaction, instead of being a private transaction, was one with the firm? It would appear to be so.

8350. In Mr. O'Hanlon's case, what was done? There were four cheques paid to Mr. O'Hanlon, and in each case from the account of Carter, Gummow, & Co., Contract 69. The particulars are as follows:— July 6th, 1894, £145; July 26th, 1894, £150; August 30th, 1894, £60; September 6th, 1894, a cheque drawn in favour of cash for £60. It was cashed in large notes and gold. From reference to the contractors' pass-books I find that it was chargeable to Mr. O'Hanlon.

8351. There can be no doubt that those transactions were with the firm and were not of a private nature? Yes.

8352. *Mr. Smith.*] Take a case of this nature—Suppose one of the members of a firm had a private account—it is not an uncommon thing, is it, for a partnership cheque to be drawn on the partnership account to meet a private liability, the individual partner being debited in the books of the partnership with that amount;—from your experience in dealing with partnership accounts can you say whether that is not a common transaction—a daily occurrence? Where there are properly kept books it would occur, but I should prefer to answer some specific question upon these points instead of answering general questions. For instance, if you could find a question upon any one of the cheques to which I have referred I should be glad to give you an answer relative to that cheque.

8353.

G. Christie.  
10 July, 1896.

8353. But is not a case such as I have just mentioned a common transaction? It may be a matter of arrangement between partners; but in this particular concern where there are so many partners, each having a specific monthly drawing, it could not occur to any extent, and I presume that in a case where each partner had a private banking account his private liabilities would be paid out of that account.

8354. But how can you say that these particular transactions could not be private matters simply because they went through the partnership books in the way you have described. Take, for instance, the transaction in relation to the £2,000? The trend of my report is that the firm at that time were needing money very badly. They had certain claims to meet, and the inference is that the money was required to meet those claims.

8355. Suppose such a state of things to exist, and suppose also that Mr. Carter said to his partners, "I have a private property upon which I am willing to borrow £2,000 outside of the firm; we have to meet certain liabilities during the next few months; I will put that £2,000 into the firm's account; as between myself and the borrower it is a private transaction; he will look to me only in the matter; so far as the members of the firm are concerned, I am to be credited with the £2,000; it is money brought by me into the firm's accounts, and the firm will pay the same interest to the borrower as I should have to pay myself";—suppose the transaction were carried out in that way; suppose that instead of the £2,000 going into the account of Mr. Carter, and his drawing a cheque upon his account, and paying it into the firm's account, a straight cut was taken by paying the cheque at once into the firm's account;—would it not be still a private matter? I am afraid I cannot follow the whole of your suppositions.

8356. *His Honor.*] The point is this—would it not be a short cut, instead of the roundabout course generally adopted in such cases? In this particular case the matter is very clear, and there is no supposition in it at all.

8357. You draw only one inference? Only one inference.

8358. *Mr. Gummow.*] Supposing this firm had an overdraft at their Bank, do you think the Bank would lend them money at 6 per cent. Not unless it were a large amount. I suppose it could be obtained at 7 per cent.

8359. Without security? With security.

8360. But I am speaking now upon the supposition that it would be without security? I could not say. I do not think a Bank would advance money without security, and at this particular time, if I am not mistaken, you had security lodged with the Bank.

8361. What security would that be? I think you will see, upon reference to the papers which have been handed in by the Bank, that at that time you had lodged securities with them.

8362. If there were no securities what would be the inference? I think the Bank would want the money paid up.

8363. That is the inference you would draw? Yes.

8364. Suppose the Bank would lend the money without security—do you consider that Mr. Carter, if he had £2,000, was taking an unwise course in his own interests, as well as in the interests of his partners, in lending the firm the money at 6 per cent.? I should think that if any one partner in the firm had money, and paid it into the firm's account with a view to reduce an overdraft, there would be some arrangement among the partners in regard to the transaction.

8365. Is not such an arrangement likely to be made? I could not say.

8366. What inference would you draw from the transaction? I should say that the money had been paid in with the knowledge of the other partners.

8367. Would it be beneficial to the interests of Mr. Carter's partners that he should do so? No doubt if it were his money it would be beneficial to his interests as well as to the interests of his partners that he should do so.

8368. I understood you to say that you thought the transaction could be carried out if there were properly-kept books, but could it not be carried out without any books whatever? I have very strong views upon the matter of books.

8369. Do you not think it would be possible for a member of a firm to lend his co-partners money without the existence of any books—would it not be fair to make allowance for a certain amount of honour and good faith as between the partners? Possibly, but the partner would stand the risk of losing the money if no proper record were kept.

8370. Are books the only bond between individuals who come together in business? They are not the only bond, but they save disagreement afterwards.

8371. Do you think business cannot be done, then, without putting everything down in black and white? I do not think your business could have been.

8372. If it were proved that it could have been, you would be wrong? I should like to see it demonstrated. Speaking of the rate of interest, is not Mr. Wheedon receiving more from you than he could from any other investment?

8373. *Mr. Parkes.*] Where partners draw regularly sums of money over and above their usual salaries, would it not be very difficult for an adjustment to be made without a proper set of books being kept? It would seem to me to be so.

8374. Take the account of Messrs. Carter, Gummow, & Co., the sum of £43 6s. 8d. appears to have been drawn regularly by Mr. Carter, Mr. Gummow, Mr. Snodgrass, and Mr. Forrest;—would not that denote that these gentlemen were partners in all the business of Messrs. Carter, Gummow, & Co.? It would indicate that. I might mention that Mr. Gummow's name does not appear continuously, as do the names of the others. But taking Mr. Carter, Mr. Forrest, and Mr. Snodgrass, they appear to have drawn this sum of money regularly from the firm's account. They commenced at £20 16s. 8d., I think, and they afterwards came up to £43 6s. 8d.

8375. And since 1894 they appear regularly to have drawn that salary? Yes. I have an extract from the books showing the drawings of the various partners, but it is not yet complete.

8376. But the regular salaries have been paid every month? Yes. Mr. Forrest, up to March, 1893, drew £20 16s. 8d. From that date throughout he has drawn at the rate of £43 6s. 8d.

8377. Out of the account of Carter, Gummow, & Co.? Out of the various accounts.

8378. Throughout this period various sums—sometimes £100, sometimes £20—have been paid to Mr. Forrest in addition to his drawings on account of salary? Yes, even sums of money, and the same with regard to Mr. Carter.

- G. Christie. 8379. These sums of money have been paid out of Messrs. Carter, Gummow, & Co.'s account? Yes.
- 10 July, 1896. 8380. And the same, I suppose, with regard to the other partners? Yes. All the payments to Mr. Carter, apart from salary, are even sums of money. There would be £20 or £100, as the case might be. There are no broken sums.
8381. Under these circumstances, in order to keep a proper adjustment of accounts as between the partners, books must have been kept? It is difficult to understand how any adjustment can have been made without a proper set of books.
8382. The bank-books denote that Mr. Forrest was a partner in all the firm's contracts? Yes; I should think so.
8383. *Mr. Gummow.*] Would it surprise you to know that a partner could tell how much the firm owed him, and how much he owed the firm, without any set of books? I hope that each member of the firm is in a position to tell what he is entitled to; but I do not see how he can arrive at it without books.
8384. Could he not arrive at it from the firm's bank pass-books? No.
8385. If I owed that firm £150, should I not know it, and would not the other members of the firm know it? There are certain necessary precautions which every man takes, and insists upon, especially when dealing with various classes of men, such as I understand your firm to have consisted of—that is to say, the members not being all of the same standing as yourself. It would seem necessary, in such circumstances, for the protection of the interests of some of the members that they should insist upon books being kept.
8386. You conjecture that they would insist upon it? Yes.
8387. But suppose that, allowing for the fact that all the members of the firm are not of the same standing, they have no disputes, and that no member considers that he is getting more or less than his share;—what would you say to that? I should say that it would be reasonable that at various times members of the firm should wish to make an adjustment of accounts. Any careful contractors would want to know the profits they had made on each job, if only by way of a guide to them for future tendering. It is a simple matter of business in all concerns. Each man naturally wants to know that he has had justice done to him. In the first place it would seem necessary that the cost and profit of each contract should be arrived at before each man can know what he is entitled to beyond his monthly drawing. The amount of profit having been ascertained, there is the distribution of profit to be considered.
8388. Supposing a partnership had been properly dissolved, and that the members had settled up all their affairs without the slightest dispute or unpleasantness, without the keeping of any books, what would you think of that? I do not know. There are certain circumstances in which a man is glad to take what he can get in order to save trouble and expense, and possibly equity suits.
8389. But suppose there is no dispute and no ill-feeling of any kind—suppose each partner takes a certain amount, not because he has to take it but because he is satisfied that he is being fairly treated in taking it—what would you say to that? I should say that there were very few such cases. They would be very exceptional.
8390. Then there is the question of Mr. Weedon's transaction—to whom did he lend the money? I am going simply upon the transaction as disclosed by the books at our disposal. I have not seen any deeds or documents, but it seems to me that the money must have been lent for the use of the firm.
8391. In whose favour was the cheque drawn? It is drawn in favour of No. 547.
8392. *Mr. Smith.*] I should like to know how you arrive at the quantity of cement which has been obtained by Carter, Gummow, & Co., from Parbury, Henty, for instance? From the returns furnished by that firm.
8393. Did you make an abstract of those returns;—did you make a note of them, or what did you do? I have kept all the papers which I have received from the various firms, but I do not produce them.
8394. How did you arrive at the totals which you have put into the report which you have read;—have you the papers upon which you arrived at those totals? Yes; but I do not produce them.
8395. Where are they then? They are in my possession, but I object to their production at the present time.
8396. *His Honor.*] You must produce all the documents by means of which you have arrived at your conclusions;—if cross-examination is directed to the mode by which you have arrived at them they must be thoroughly explained? I have endeavoured to make the information afforded in my report as explicit as possible, and I think I have afforded sufficient information to enable other persons to prove my figures for themselves. I have seen the ledger accounts of the various firms and the whole of their transactions during the time referred to. They have given me information as to the quantities which represent the amount charged in the accounts, and they have also furnished me with particulars of the delivery of those quantities. From this information I have compiled my report.
8397. I presume Mr. Smith would like to know the names of the individuals to whom you had recourse? In the case of Parbury, Henty & Co., Mr. Henty, junior, the resident manager, afforded me the information.
8398. *Mr. Smith.*] I understood you to say that you had been furnished with particulars from that firm, from which you had made up your returns, showing the total number of casks in that case;—that is the document I should like to see? I do not produce it.
8399. Have you it? It is within my control.
8400. *His Honor.*] I suppose you have taken a number of extracts from the account books of various firms, and that you have made up your report from them? Yes; the statement I have made is quite complete.
8401. *Mr. Smith.*] Upon what ground do you object to produce the documents which you say contain the figures upon which your report is founded? I am appearing here more particularly under the instructions of Mr. Parkes. That is my position.
8402. Have you any other reason for not producing them? It is not for me to say what is to be done with any papers which may be in my possession bearing upon this question.
8403. *His Honor.*] The papers are yours and no one else's;—you have full control over the whole of your own calculations? I take it that if I am employed by any person to make those calculations the papers will be theirs, and not mine.

8404. You are merely asked to give the simple data from the books upon which you found your calculations? The contractors were asked to prepare this very same statement, and they have had an opportunity to prepare it. They ought, as a matter of fact, to know more about their affairs than I do. G. Christie.  
10 July, 1896.
8405. *His Honor.*] Under the circumstances I must direct production of the papers? Of course that being so they will be furnished to the Commission.
8406. *Mr. Smith.*] I understand that in the case of Parbury, Henty, & Co. you saw Mr. Henty, junr.? Yes, and some of his subordinate clerks.
8407. Do you know who they were? A ledgerkeeper and his son. I think their name is Holden.
8408. Whom did you see in the case of Mr. Henry Austin? I saw Mr. Austin himself and his book-keeper. I do not know the name of the book-keeper or the clerk.
8409. Whom did you see in the case of Burns, Philp, & Co.? Mr. Alexander.
8410. And in the case of Mr. John Try? I did not, for certain reasons, visit Mr. John Try's.
8411. Did you get your returns from each of the persons you have named? Yes, except in the case of Mr. John Try.
8412. How did you arrive at your figures in that case? You will see from the report that I took the amount paid to Mr. John Try, and estimated the price at 9s. 6d. per cask.

Mr. John Carter recalled and further examined:—

8413. *Mr. Parkes.*] Apart from the merchants named in Mr. Christie's report, have you within the last four years purchased cement of any others? Those of whom we have purchased are Parbury, Henty, & Co., Henry Austin, Burns, Philp, & Co., and John Try. I think that is the lot. J. Carter.  
10 July, 1896.
8414. *His Honor.*] I understood you to say that the whole of the names appeared in your bank pass-book? Yes.
8415. *Mr. Parkes.*] What is the greatest stock of cement you have kept? I think we have had 5,000 or 6,000 casks in stock.
8416. What number have you in stock now? I could not tell you.
8417. Where do you keep your stock? Wherever we are at work.
8418. Where are you working now? At Baimain, on the sewerage contract.
8419. What is the street there in which you keep your cement? I am referring to the Johnstone's Creek works. The store is on vacant land.
8420. Near the aqueduct? Yes.
8421. Is the cement there in bags or in casks? In casks.
8422. Is that the only stock you have? We have another stock over at White's Creek on the same job.
8423. How many casks are there there at the present moment? I have not the faintest idea. I have not been there for a month.
8424. You do not keep such a stock, for instance, as 10,000 casks? No, we should not keep that quantity; but we have had quite 5,000 or 6,000 in stock.
8425. *Mr. Gummow.*] Do you know when the duty came off cement? Yes.
8426. Had you a large stock on 30th June? No. We wanted to save the duty of 2s. a cask.
8427. You did not get more than you absolutely required? Certainly not.
8428. *His Honor.*] Are there any other places besides the White's Creek and Johnstone's Creek aqueducts where you have any cement stored at the present time? No. I think I may go so far as to say that we have at times had as many as 7,000 or 8,000 casks stored on our various contracts. Sometimes we have had the cement 6 or 8 months before we wanted it so that we might get it tested and have it ready for use. That accounts for contractors coming to us to borrow cement. We were the only firm who had it. No one else had the pluck to get it.
8429. When you lent cement on various occasions, did you always get it back in the form of cement? No; sometimes by cheque, so that we are hopelessly mixed on that subject at present. I could remember what we received at the time of the transaction, but I could not remember now.
8430. Did you ever get any cement in respect of which payments would not appear in your bank books? No.
8431. Was any cement given to you in exchange for anything else which you had lent? No.

MONDAY, 13 JULY, 1896.

George Christie recalled and further examined:—

8432. *Mr. Smith.*] In the memorandum you submitted the other day you told us that the total amount of cement purchased by Carter, Gummow, & Co., of Parbury, Henty, & Co., was 17,970 casks—how did you arrive at that total? First of all by an examination of their ledger account from 1st January, 1892, and obtaining a copy of all the details making up the total of each item charged to debit or credit. The ledger account included debits for purchases other than cement. These were separated, and a complete list was made out of the purchases of cement apart from other purchases. Messrs. Parbury, Henty, & Co. were then requested to supply certain particulars as to deliveries, and these were supplied. G. Christie.  
13 July, 1896.
8433. What were those particulars? Information which was not in the invoices they supplied. There were certain deficiencies in the particulars as to delivery.
8434. What were the deficiencies you speak of? They had not a record in their principal books of the whole of the information as to delivery.
8435. So that the whole of the 17,000 casks did not appear in their ledger account—is that it? The quantities were right, but certain inquiries had to be made as to the exact locality of delivery. The principal ledger did not show in all cases the exact locality.
8436. Although the ledger account showed the whole total of 17,970 casks it did not give you particulars to enable you to say to what places the cement was sent? No. The ledger would not show that.
8437. The same observation, I take it, applies to the other cases; the figures appearing in the first column of your table show the amount appearing in the ledgers of these four firms—is that not so? A ledger is an index to all the other books; practically it sums up all the other books. Starting with the ledger,

- G. Christie. ledger, you get a key to all the information in the books. The ledger gives a date and the total, and you have to go to the subsidiary books for the details. In some small businesses all the details are shown in the ledger, but in the case of a merchant's business the ledger is the key to the other books.
- 13 July: 1896. 8438. So that only the total quantity would appear in the ledger? Not in the ledger itself.
8439. Not the whole of it, do you say? It all depends. All debits would appear, the date and the amount of the debit. The date of any particular supply and the amount of it would appear in the ledger.
8440. But not the number of casks? No.
8441. So that all that the ledger would disclose would be the total amount charged against the firm? Yes.
8442. And you say you have to go to the other books and to the invoices to get at the number of casks—is that so? Yes.
8443. Did you get from Parbury, Henty, & Co. a list of invoices? Yes.
8444. Have you it with you? Yes.
8445. Will you hand it in? I do not do so at present. I would rather leave that for future discussion.
8446. At all events you have a list of the various invoices? Yes.
8447. Did you get the invoices themselves of which you have the list? Yes. What I now hand you is the copy from Parbury, Henty, & Co.'s books, made by their own staff.
8448. This document purports to be a copy of the invoices? Yes.
8449. In full? Yes.
8450. It is not merely an extract from invoices, it is a copy of each invoice? Yes, of all the essential points. There may be some little item in the invoices which would not appear—matters, for instance, which they may have put down for their own information.
8451. *His Honor.*] As far as you know it is a copy of the account of the firm with Carter, Gummow, & Co., and covers everything? Yes.
8452. *Mr. Smith.*] Are the marks in red ink against some of the items made by you? No.
8453. What is the meaning of the marks in red ink? They are in the handwriting of Parbury, Henty, & Co.'s clerk.
8454. Do the red marks purport to be a copy of what is in the invoices? No.
8455. They have been added since the invoices were made out? That which appears in black ink is on the face of the press copy of the invoices. The writing in red ink has been added.
8456. So far as the invoices themselves go, as they stand there is nothing to show to what particular contracts these particular quantities of cement went? It appears in many of the invoices, but not in all. This is not my writing. It is information furnished by the firm at my request. They furnished the documents as they appear in black ink in the first instance, and I pointed out to them that that was not enough and that I required other information. The additional information appears in the red ink. In some cases the details appear in the invoices.
8457. Can you show me from the items the number of casks which make up the total of 4,300 which are alleged to have been sent to the North Shore contract—have you any list showing that? Yes; I have a detailed list.
8458. It refers to the invoices, I suppose? Yes; the number of the invoice is given for identification.
8459. And the statement shows how you arrive at the 4,300 casks which were supplied to the North Shore contracts? Yes.
8460. And it also shows how you arrived at the number supplied to other contracts? Yes; the one statement supplies the whole of that information.
8461. It is founded upon the invoices with the additional information supplied by Messrs. Parbury, Henty, & Co. since the invoices were made out? Yes.
8462. I do not know whether I quite understand how you have arrived at the 1,200 casks supplied by Mr. John Try. You say that the whole of this cement went to the Annandale and Leichhardt contracts? Yes.
8463. How did you arrive at that conclusion? For certain reasons the books of Mr. John Try were not asked for, and the information regarding the purchases from him are based upon the payments to him as disclosed by the Bank passbooks and the cheques mentioned therein. I have a list of these payments, making a total of £588 6s. According to the contract, Mr. John Try was to supply the cement at 9s. 6d. a cask.
8464. Was there an agreement in writing? Yes; I have referred to that, and I have the information definitely, so that in taking a liberal calculation—that is to say, 10s. a cask—I put down the number at 1,200. That is a very liberal calculation, indeed.
8465. What was the nature of the agreement—was Mr. Try to supply so many casks a month? I have not seen the agreement itself, but I obtained certain information in reference to it, and from this information I ascertained that 9s. 6d. per cask was to be paid for the cement delivered at Annandale.
8466. Did the agreement specify any particular contract? I could not say that it specified the contract, but you will see from the return that there were two contracts in the neighbourhood of Annandale, and they are included in one column in my statement.
8467. The Annandale and Leichhardt contracts? Yes.
8468. And you arrive at this total in that way? Yes; it is calculated simply upon the amounts paid to Mr. John Try.
8469. With regard to the 1,402 casks obtained from Henry Austin and the 1,000 casks obtained from Burns, Philp, & Co., you have corresponding lists of invoices? Yes; I have the same particulars in the case of Burns, Philp, & Co. and Henry Austin.
8470. Where did you get the information, in the case of the supply of cement by Burns, Philp, & Co., as to the places to where the casks were sent? The items in the case of Burns, Philp, & Co. were furnished to me with the copies of their ledger in the form of an account current, and after eliminating certain items which do not come within the period, there is only one item in which we are concerned. That is dated 14th July, 1893, the amount being £487 10s., represented by 1,000 casks of cement, for which the invoice is produced.
8471. But why do you come to the conclusion that it went to North Shore? Because it is invoiced to Carter & Co. at North Shore; and in the second place because they required that quantity of cement to make up the total amount on which they obtained the advance referred to in my memorandum.

G. Christie,  
Esq.

13 July, 1896.

8472. And this, you say, is the only invoice that is material? Yes.
8473. The invoice dated 23rd June, 1892, shows that 118 casks of cement were sent to Carter & Co., Shea's Creek? Yes.
8474. On 7th July, 1892, 109 casks were returned? Yes.
8475. On 17th May, 1893, 750 casks were sent to Carter & Co. at North Sydney? They were destroyed in the course of delivery. The punt caught fire, and it being necessary to deluge it with water, the cement was spoilt.
8476. These are all the items relating to cement, all the invoices for cement that you can find in Burns' Philps' books for that period? Yes.
8477. As to Henry Austin's account, you produce a copy of the ledger account, and it contains two items to Carter & Co.—July 15th, 1893, 400 casks, and July 24th, 1893, 1,002 casks? Yes.
8478. And these make up the 1,402 casks mentioned in your return? Yes.
8479. Have you the invoices relating to those? These are the invoices I obtained relating to that case.
8480. How do you know the cement went to North Shore? In the same way as in the other cases.
8481. How is that? From the dates, and from the fact that it was the only contract which Carter & Co., had at the time.
8482. What do you say to the item of 619 casks on 30th April, 1892? That the cement was delivered to Gummow and Gillan.
8483. You do not know what became of it? No; I had nothing to do with that.
8484. On the same date—that is, April 30th, 1892—there is an item of 967 casks;—what do you say as to that? That it was sent to Shea's Creek.
8485. On May 7th, 1892, there is an item of 994 casks;—what do you say as to that? It went to Shea's Creek, according to the invoices.
8486. On the 23rd May, 1892, there is an item of 184 casks? It is not stated definitely in the invoice where it was sent to, but it evidently went to Shea's Creek.
8487. On 11th July, 1892, there is an item of 331 casks? That was delivered to Gummow and Gillan.
8488. On 11th August, 1892, there is an item of 409 casks? Yes; delivered at Waverley.
8489. And all those items are excluded from your return? Yes. Of course you will understand that in dealing with this matter of cement, the dates were in my possession on which Carter & Co. obtained their Contract No. 79, after the stoppage of No. 72 Contract. They were then, as far as I can judge, finishing the Waverley contract, but Contract 79 was practically the only contract they had to go on with, and they do not require cement until some time after they have started a contract, because they have to get down the shafts. These various points have to be considered when you are dealing with the question of cement.
8490. From March, 1891, to November, 1891, there were large purchases of cement by Mr. Carter? Yes, for various contracts.
8491. On 12th February, 1892, for instance, there is an item of 175 casks? Yes; delivered to the Glebe.
8492. And on 20th February, 1892, an item of 464 casks? Yes; delivered at Waverley.
8493. And on 18th February, there is an item of 464 casks? Yes; delivered at Waverley.
8494. On 22nd April, 110 casks? Delivered at Waverley.
8495. Those are all the items which appear in connection with the account with Henry Austin? Yes; all that refer to my return may be summed up in two invoices—that is to say, the invoices of July 15th, 1893 and July 24th, 1893. The others all have reference to contracts prior to Contract 79.
8496. Those are the only items out of all those appearing which you put in your return? Yes; because they are not connected with Carter & Co.'s Contract 79, 79A, and 69. The items represent other cement which did not go into those contracts.
8497. In the list of invoices which you received from Parbury, Henty, & Co., are there any items which are not included in the 17,970 casks? No; the whole of them are included.
8498. All those invoices are included? Yes; because the transaction with Parbury, Henty, & Co. was in connection with the supply of cement to the North Shore contract, and the finishing of the Waverley contract. It is pretty clear I think that a little cement was required to finish at Waverley, and then they went straight on with the work at North Shore.
8499. *Mr. Gummow.*] You have had copies of invoices from Burns, Philp, & Co.? Yes.
8500. Have you copies of invoices from Henry Austin? Yes.
8501. Were these copies made by the firms themselves? Yes.
8502. Did Parbury, Henty, & Co. make out the copies you have in their case? Yes.
8503. They were made by one of their staff? Yes.
8504. You are quite sure of that? Yes.
8505. Did the firm guarantee them as correct? They are prepared to attend, and swear that they are correct.
8506. They told you that they were absolutely correct? Yes.
8507. And as to the deliveries of these different quantities of cement, do they guarantee those as correct? Yes.
8508. In each case? Yes; whatever is stated in their documents.
8509. Are the statements as to the delivery of cement guaranteed by the firm, or are they only your own statements? I think in the case of Mr. Henry Austin's deliveries, the cement went into lighters as stated in the invoices. I made searches which show that it went to North Shore.
8510. But did the firm give you particulars of the delivery definitely? Yes; other than in the case of Henry Austin, and that was clearly delivered at North Shore.
8511. Do you know whether the cement delivered at these different places was used upon the works there? My report does not go into that matter at all.
8512. Do you know whether Carter & Co. in buying cement bought for particular contracts, or on a large scale for future use? I could not say as to that.
8513. Have you seen any of their contract notes? No; but I have seen information gathered from the contract notes.
8514. Do you know how much cement Carter & Co. had in stock prior to 1st January, 1892? Where?
8515. Anywhere? That would be shown upon the certificates upon which they obtained advances, I presume.

- G. Christie,  
Esq.  
13 July, 1896.
8516. But what had they in stock previous to January, 1892? I should say that you had none, because you made such petty purchases to complete other contracts that you had. I should argue from that that you could not have had any stock.
8517. That is the inference you draw? Yes.
8518. You said you had checked everything, and that you had no doubt that your audit was perfectly correct? Yes.
8519. That is the case, is it? Yes.
8520. As to these advances upon cement, let me refer you to the Parliamentary papers. In your memo. as to advances on cement made to Carter & Co. upon Contracts 79 and 79A you refer us to page 360 of the Parliamentary papers as to the Department's rule in regard to advances, viz., "75 per cent. of value up to 75 per cent. of contract deposit";—will you show me that paper? The wrong page is given. It should be page 366.
8521. Do you know whether it is the rule of the Department to give this advance? If you will refer to page 366 you will find the following minute by Mr. Davies:—
- The contractors have been asked that an advance be made on approved cement on this contract. It is usual for this to be done, and I recommended that the request be complied with to the extent of 75 per cent. of the amount of the fixed deposit (£485), at the rate of 75 per cent. of the value of the cement on the ground, on condition that the contractors sign the usual agreement.
- That passed through various officers. It was approved by Mr. Hickson, and was referred to Mr. Davies, and sent on by him to Mr. Norrie.
8522. What does the agreement upon page 367 say? It runs as follows:—
- In consideration of the Minister for Public Works in and for the Colony of New South Wales advancing to us the sum of £485, and of any future advances to be made to us, we hereby agree to repay to the said Minister for Public Works the said sum of £485 and future advances.
8523. That refers to future advances as well as to the £485? It contains the usual condition in any mortgage.
8524. But does the agreement mean anything;—what is meant by it? The minute which I have quoted was noted by various officers, going on finally to Mr. Hungerford; and I suppose it is intended to convey the information that no greater advance than that specified should be made; but more has been advanced.
8525. But what is the meaning of the term "and future advances"? I take it that the use of that language only fixes the amount more definitely.
8526. But it does not prevent the Department from making advances over and above £485? If it be necessary to go through the whole of this formula in reference to the advance of £485, I presume that any increase upon that amount could not be made without the same formula being gone through.
8527. Further on in your report you say: "Contract 79A. Contract deposit, £485. The amount advanced exceeds 75 per cent. of deposit, £485, viz., £360"? I believe that is the amount.
8528. Do you know the amount of the deposit in the case of 79A? I have taken the percentage to be upon the £485.
8529. Does not the minute say, "I recommend that the request be complied with to the extent of 75 per cent. of the amount of the fixed deposit (£485)"? I now see from the other documents that the deposit is £650. I accepted as correct the amount in the minute, viz., £485.
8530. You clearly made a mistake? Well, there would appear to be a mistake in the minute.
8531. Would it make a difference in your statement? I had better say exactly what difference it would make. It will make a difference of £125 in the items referred to in the last paragraph. It will reduce each of the four sums of £296 to £171, and it will reduce the amount of £179 to £54. It will make an over-advance of the amounts which I now state upon those five different certificates. The amount of £15 in the paragraph disappears.
8532. As regards the value of cement on the ground, how do you arrive at it? I think I have been liberal in putting it down at 11s. 6d.
8533. How did you arrive at that price? The price at which the cement was purchased was 9s. 9d., and I am allowing the most expensive mode of delivery.
8534. What do the schedule rates for any contract accepted by the Department say;—do they not provide for payment upon material delivered by the contractors? Yes. To what items do you refer?
8535. I refer to the item for cement? The price quoted for the supply by you of a dozen casks of cement was never intended to apply to an advance upon the whole stock of cement. Besides, anyone advancing upon cement would naturally advance upon the cost. You supplied about twelve casks ultimately at the price named in the schedule, viz., 16s., but an advance would, as a rule, be upon the cost of the goods to the person holding them.
8536. Would not the 75 per cent. advance be upon the schedule rate in just the same way that the 90 per cent. advance upon work done would be at schedule rates? I can only repeat what I said—that 16s. was intended to be the price for a few casks, which you might have to deliver to the contract as cement, but if the Department were requiring 1,000 casks of cement they could be purchased at less than 11s. 6d. a cask.
8537. The point is this: If the Department make an advance at all, would it not be to the extent of 75 per cent. upon the schedule rates? I had no intention of being present this morning as a witness, and I have not with me the papers referring to this particular matter.
8538. The point I wish to bring out is this: That there is a certain schedule price for cement, and in the lending by the Government of 75 per cent. upon cement, the value of that cement would be the value set down in the schedule? I could not agree with that conclusion. No matter what the contract price would be for a small quantity, it does not follow that the Government are expected to lend at that same price upon 2,000 or 3,000 casks.
8539. Do you think the Government have lent money upon that basis? Yes.
8540. And you do not agree with that course? No. I have referred again to certificate No. 17, and I find that it substantiates fully what I stated in my memorandum. The certificate shows that the cement was valued at the rate of 16s. a cask to the amount of £2,160, and that you received 100 per cent., and that there was not the usual deduction of 10 per cent. for contract work. The Government advanced you 16s. a cask upon the cement.
8541. Sixteen shillings a cask is the price appearing in the schedule? Yes; but it was not intended that you should supply 3,000 casks of cement at that price.
- 8542.

8542. Is it not greatly to the advantage of the Government to make this advance upon cement? In what way. G. Christie.
8543. By obtaining more competition, by assisting contractors financially? I think the Government are really destroying the security they have by making an advance upon it. 13 July, 1896.
8544. But are they not getting their work done more cheaply by assisting competition? I do not think so. I do not think it is of any benefit whatever to the country. It would be much better in the interests of the State to have stable contractors who would not require these advances, contractors who on entering into these works were able to finance themselves. No good Government would take off 10 per cent. from the work and then advance £2,000 upon cement. That is not business at all.
8545. But does it not assist competition if a tenderer knows that he can obtain financial assistance from the Department—take the case of a tenderer who, if he had not that assistance, could not afford to tender? With reference to the specification and your statement that the Government did authorise this advance upon cement, I suppose the only matter which would influence a tenderer if he studied the specification would be a clause stating that he was entitled to the advance.
8546. *His Honor.*] What you mean to say is that if there were a condition in the specification permitting the advance it is right to assist the tenderer; but that otherwise you do not think it would be so? Quite so.
8547. *Mr. Gummow.*] Will you look at page 120 of the Parliamentary papers; look at the last two lines of clause 34 of the general conditions—does it not show that contractors can get an advance upon material on the ground and not in position? That is not in the specification in the case of Contract 79 with which we are now dealing. That is a new specification.

George Edward Hudson sworn and examined:—

8548. *Mr. Parkes.*] You are a contractor? Yes. G. E. Hudson.
8549. In 1891 you were allied in your business with another gentleman named C. B. Bond? Yes. 13 July, 1896.
8550. Who is Mr. Bond? A commission agent, carrying on business in Sussex-street.
8551. Is he a builder? No.
8552. Is he a financial agent? He was a commission agent; he has now retired from business.
8553. Was he a man of means? I suppose so; he was supposed to back me up through any work I got.
8554. He found the money and you found the experience? He found the money and I had to do the work.
8555. Do you recollect tendering for Contract 79—I mean the contract in Alfred-street, North Shore? Yes.
8556. You and Mr. Bond were the lowest tenderers? Yes. [*Vide Appendix No. 32.*]
8557. Did you not wait for a considerable time for the acceptance of your tender? Yes.
8558. For how long? Three or four months.
8559. Not longer? I could not swear to the time now. I fancy that it may have been longer, but I would not swear to any time. I remember coming to the Department on several occasions, and asking them when they were going to start the work.
8560. When your tender was not finally accepted, what did you do—did you come to the Department? Not afterwards.
8561. I mean when you found that there was delay in the acceptance of your tender? I came and asked them if they were not going to give me the job, and they said they were not likely to go on with it for two years.
8562. Who told you that? Mr. Piper, I think.
8563. Where did you see that gentleman? In the Department.
8564. In what part of it? I could not say.
8565. Was it in the tender board-room? I could not swear.
8566. Was it in the big room in the front of the building? I saw a good many persons about the getting of my money; but I think it was Mr. Piper who told me that I could, by writing, get my money back without prejudice.
8567. What did you take him to mean by that? I took him to mean that we could put the money up at any future time.
8568. And you left with that understanding? Yes; we wrote for the money, and got it back.
8569. Who wrote? Mr. Bond did all my correspondence. I told him that if he wrote for the money he would get it.
8570. When you wrote for the money, was it your intention to relinquish the contract, and not to take it up? No. I had to pay Mr. Bond 9 per cent. for the money. That was the amount he charged for any money which he advanced for works. I think £369 was the amount of the cheque paid to the Government, and when the Department told me that they were likely to be two years before they went on with the work, I naturally wished for the money back again, because I did not want to pay 9 per cent. upon it for the two years. Mr. Bond wrote for the money, and he told me afterwards that he got it.
8571. Did you understand that he was to write, relinquishing the contract altogether? No; I did not know that.
8572. You continued to anticipate that you would have the contract until you saw something in the newspapers, did you not? Yes. I remember one evening my boy saying to me, "Dad, did you see they were going to call for fresh tenders for the North Shore job?" I said "No," and he said, "Well, it is in the papers." I saw in the newspapers the next morning, at breakfast time, that the Minister had given the job to Carter & Co., on account of their agreeing to forego some claim in connection with the Shea's Creek contract.
8573. During all that time you had been expecting Contract No. 79? Yes.
8574. Would you be surprised if you knew that Mr. Bond—after your conversation with him—wrote, upon the 28th September, 1891, in the following terms, to the Department?—

*In re Contract No. 79, Sydney Sewerage Works.*

Dear Sir,

88, Sussex-street, Sydney, 28 September, 1891.

On 10th June of this year, we had the pleasure of submitting a tender for the above works, and, we believe, were successful in being the lowest tenderers.

We

G. E. Hudson. We have been anticipating the acceptance of our tender for some months, but not hearing from your Department, we have, in the meantime, entered upon other obligations, and must consequently respectfully ask you to permit us to withdraw our tender, and to return us the deposit attached thereto now lying in your hands, viz., £369.

13 July, 1896.

We are, &c.,

C. B. BOND

(Bond and Hudson).

I never heard of that letter before. I did not know at that time what letter Mr. Bond wrote. I simply told him to withdraw the money, as I could not be paying interest upon it.

8575. You did not know that he was going to withdraw the tender as well? No; I understood that he was going to withdraw the money.

8576. And that, ultimately, you were to go on with the contract? Yes. If the Government had called upon us to put up the money again, to go on with the contract, we should have done so. That is what I understood.

8577. Had you any communication at all in writing, or by word of mouth, with Mr. Hickson about this contract? No. I have only spoken to Mr. Hickson once or twice, and that was in connection with a contract for water-pipe laying.

8578. Did you know of the existence of the following letter from Messrs. Carter & Co. and Messrs. Gummow and Gillan to the President of the Tender Board?

Sir,

Sydney, 10 June, 1891.

We have the honor to enter our protest against the acceptance of the tender of Messrs. Bond and Hudson for Contract No. 79, North Shore sewerage, on the following grounds:—

1. That the tender of Messrs. Bond and Hudson for Contract No. 56, Potts' Point sewerage, was accepted by your Board and not taken up by them,

2. Upon fresh tenders being called the tender of Mr. G. E. Hudson was the lowest, but was not accepted by the Board, in accordance with their rules and regulations.

Upon these grounds we, as tenderers for the North Shore sewerage, beg to protest against the tender of Messrs. Bond and Hudson being now accepted.

We have, &c.,

GUMMOW & GILLAN.

CARTER AND CO.

I know nothing about that. I know that we did tender for the job in Victoria-street.

8579. Will you tell His Honor how you came to throw up the job? We tendered for the job in Victoria-street £3,000 or £4,000 lower than the price of the next tenderer to us.

8580. Who were the next tenderers? Gummow and Gillan; I cannot be positive, but I am almost sure that we had an amount of £120 in with the tender. Looking at the fact that we were a good bit below the next tenderers, I thought there might be something more in the work than I anticipated, and that it would pay us to throw it up although there would be a loss of £120. I told Mr. Bond so, and he pointed out that the loss was considerable. I said to him that while there was one brick over another in my house he could hold it as security against any loss. I told him I thought it would be better to let the job go and tender for it again. I afterwards did so, on behalf of Mr. Bond as well as myself, but he was not at home at the time, and I did not put in his name. Mr. Bond was on the Richmond at the time, but he had left a signed cheque to be put in with any tender, and his son had directions to fill it in. When Mr. Barling was reading over the tenders in the board-room he read out, I think, Hudson as the lowest tenderer, but it was determined that as I had previously thrown up a job the Department would not accept it.

8581. Who got the contract? Messrs. Carter & Co.

8582. They carried out No. 56 Contract? Yes.

8583. Did you look upon Contract 79 as being a losing or a profitable contract? I was satisfied with my prices.

8584. What did you expect to make? I thought about £5,000. I am not an educated person. I am a practical man, and I knew what I would get per yard for driving, and upon that I made out my calculations.

8585. Did you receive any indication at all from the Department after your tender had been sent in that it had been accepted? I do not remember.

8586. Did you see any officer of the Department about the acceptance of your tender for the North Shore Contract? Only when I came, as I have told you, about the return of the money.

8587. But not before that? No.

8588. Do you know whether Mr. Bond did so? I do not know. All my communications with the Department by letter were carried out by Mr. Bond.

8589. Did he put up a deposit anywhere in connection with the carrying out of the work—did he put a deposit in any bank? I remember some money being put in the English, Scottish, and Australian, Chartered Bank, but whether it was for the Victoria-street job or the North Shore job, I am not sure.

8590. What was the amount? It was about £2,000, I think. I think arrangements were made for the money with the English, Scottish, and Australian, Chartered Bank.

8591. Did you know any other officer of the Department besides Mr. Piper? No, I cannot say that I did. I saw a good many, but I do not know their names. I was a perfect stranger in the Department at the time.

8592. You know where the tender-board room is? Yes.

8593. Did you ever speak to the clerk in the board-room? You mean Mr. Mitchell—yes. I went often down to him to get back the amounts which we had put in with other tenders.

8594. Did you speak to him about the contract? I could not say now.

8595. Therefore the only intimation you had as to the acceptance or rejection of your tender was through the newspapers? Yes; I saw from the newspapers that Carter & Co. had the job.

8596. In the meantime you were under the impression that you would get the work, although it might be hung up for two years? Yes; they told me two years might elapse before it was proceeded with.

8597. *Mr. Smith.*] Who is Mr. Bond? Mr. Chapman Bonnard Bond, of Sussex-street.

8598. What is he? He was a commission agent. He has retired from business now, and it is being carried on by his son.

8599. Did you enter into partnership with him? There was no written partnership. I worked for him at first as a licensed drainer, and I gave him satisfaction on some private job. Afterwards I got a contract under a son-in-law of his, a Mr. Kenwood. I also completed that work to his satisfaction. Then I tendered for a job with a man named Chandler to do all the water-pipe laying in the city of Sydney. I went to Mr. Bond and asked him to become a bondsman, and he did so. 8600.

G. E. Hudson  
13 July, 1896.

8600. For a consideration? I put £100 in his hand as security that he would not lose anything.
8601. Did he get a share of the profits? He got interest upon any money which he lent to me for the carrying on of the works. He got 10 per cent. at that time. After that Chandler took to drinking hard, and Mr. Bond would not lend me any more money while I had any connection with him. I therefore had to dissolve partnership with him. Mr. Bond lent me money until that job was finished, and as soon as it was finished we tendered for work under the style of Bond and Hudson.
8602. So that there was no general deed of partnership? No. Mr. Bond was always secured because all the vouchers were payable to him.
8603. You were partners in respect of any particular contract you took up together? Yes. I used to get wages every week from the day the job started until the day it was finished. When the last man was sacked my wages stopped.
8604. How did you share your profits? We divided them equally after Mr. Bond had taken 9 per cent. for the money advanced.
8605. I suppose you looked to him to manage all the financial part of the business? Yes.
8606. You left that entirely to him? Yes.
8607. After you had sent in your tender for Contract 79, and it was not accepted, did you enter into any other contract with Mr. Bond? Since then we have done a job at Parkes.
8608. But you have not gone into any other job with him since then? We did a job at Devonshire-street under the Water and Sewerage Board.
8609. Can you remember any other partnership contracts? I am not sure whether some of these were before or since the job you are referring to. For instance, there was the job from the Ryde pumping station to the Chatswood reservoir.
8610. Is that a big work? It was a job of over £8,000.
8611. I think you said that you had a talk with Mr. Piper about the return of your deposit? Yes.
8612. What made you go to him about it? I wanted to find out where I ought to go.
8613. You came to the Department to know what they were going to do with regard to this particular contract? Yes.
8614. And you say you saw Mr. Piper? Yes.
8615. Before you went to see Mr. Piper did you see Mr. Bond? Of course.
8616. And what did you arrange with him? He told me that I should have to pay interest on the money if we did not go on with the job.
8617. Did he tell you to find out how the thing stood? Yes. To see when the job was going on. He pointed out that if we did not get back the deposit money I should have to pay the interest on it.
8618. After you had seen Mr. Piper did you see Mr. Bond again? Yes; I was always in communication with Mr. Bond. I told him to write for the return of the deposit, and he did so. I never saw the letter that was sent.
8619. Did you not generally see the letters which were written for the partnership? No. I never bothered my head about it. I simply told him to write a letter and get the money.
8620. You left the whole thing to Mr. Bond? Yes. He did all the financing.
8621. And now it turns out that Mr. Bond wrote a letter withdrawing the tender absolutely? Yes.
8622. You did not know that? I cannot say I did. I never before saw the letter to which you refer, and I never heard it read.
8623. Who drew the money when it was returned by the Department? Mr. Bond, I suppose.
8624. You do not know whether you got the money back or whether Mr. Bond got it back? I asked him to go to the Treasury after the money, and I do not know whether he did so or whether it was paid into an account. If it were paid into a bank, I suppose it would have been paid into Mr. Bond's account.
8625. As to the Potts Point sewerage work, Contract 56, you tendered for that work? Yes.
8626. I suppose you knew that there were certain rules and regulations of the Department attaching to all tenders? Yes. Of course I read the specification.
8627. One of the clauses is that if you make a default or forfeit a deposit you are afterwards excluded from competing—is not that the effect of clause 14? I think there is a clause to that effect, but I do not know the number of it.
8628. It was on account of that clause that you were not given the contract to which you have referred, I suppose? I did not expect it altogether; I did not expect to get it.
8629. *Mr. Gummow.*] Did you get back the deposit you made in connection with Contract 56? Yes; I got it back during the Dibbs' administration.
8630. *His Honor.*] How long afterwards would that be? It must have been two years afterwards. I know that I applied for it when Mr. Bruce Smith was in office, and he would not give it to me. They did not know enough of me in the Department. Some time afterwards, when Mr. Dibbs was in office, I applied for the money, and I then succeeded in getting it back.
8631. On what date was that? I have no idea.
8632. But it was two years afterwards, you say? It would be about that, I think.
8633. *Mr. Gummow.*] You say that Gummow and Gillen were the next tenderers to you upon Contract 56? Yes.
8634. Did you expect that they would get the work after you threw it up? I thought it very probable that they would. Sometimes the contract was given by the Department to the next tenderer, and sometimes fresh tenders were called for. In this case they called for fresh tenders.
8635. Would it not have been fair play to give it to the tenderers next to you? I thought that would be done. I should not have thought there was anything wrong about it.
8636. When tenders were called for the work again Carter & Co. got it? Yes.
8637. Do you know whether their price was more or less than Gummow and Gillen's first tender? That I do not know, but I think it was lower than your first tender.
8638. You threw up the contract because you thought you would probably make a loss upon it? I did not think we should make enough on it.
8639. You did not think you had a good enough price for the work? Not when I saw the other tenderers so much above me.
8640. In the case of Contract 79, you were £3,000 below the next tenderers? Yes.

- G. E. Hudson. 8641. Did you know anything more about that class of work than you had known previously? No, I cannot say that I did. I had not much experience.
- 13 July, 1896. 8642. You had not done any work in the meantime? I had done some work under the Water and Sewerage Board.
8643. But tunnelling work I mean? There were a few chains of tunnelling on the work I did on the Challis estate.
8644. You thought you might make about £5,000 out of the North Shore contract if you got it? Yes.
8645. How did you arrive at that estimate? I cannot go into it now. The thing happened a long while ago. I know that Mr. Bond asked me, as he always did, what the profit would be, and I remember that I worked it out at about £5,000. I must have had someone to work it out with me for his satisfaction.
8646. Did you base your tender upon what you knew of the other tenderers? No. Every item was separately worked out not only by myself but Mr. Bond's son-in-law.
8647. Do you know who got Contract 79? Carter & Co.
8648. Not Carter, Gummow, & Co.? That I do not know. It is rather a fine distinction.
8649. *Mr. Smith.*] When you did hear that Mr. Bond had written in this way withdrawing the tender did you say anything to him? No.
8650. Did you protest against his having done so without your knowledge? No.
8651. You said nothing at all; you simply accepted whatever Mr. Bond did? Whatever Mr. Bond did in that line was binding upon me. I had thorough confidence in him.
8652. *Mr. Parkes.*] Have you not heard of this letter for the first time to-day? Yes.

John Carter recalled and further examined:—

J. Carter.  
13 July, 1896.

8653. *Mr. Parkes.*] Before you received Contract No. 79 at North Shore had you any conversation or arrangement with Mr. Hickson, or had you any conversation with him before you paid to Mr. Bond £750 to drop his contract? Not the slightest.
8654. You had no conversation at all with Mr. Hickson? None at all. I did not know him at that time.
8655. Was it about the period of Mr. Bond writing this letter that you gave him £750 to relinquish his tender; that would be about 18th September, 1891;—was it at that period? At about that period I presume, but I do not remember the date.
8656. At the same time did you pay a sum of money, namely, £200, to Mr. Bond's son-in-law, Mr. Kenwood? That I could not tell you. I had some dealings with Kenwood & Co. over the Silkstone railway and other contracts.
8657. Did you not on 23rd March pay a cheque for £200 to Mr. Kenwood for arranging matters with Mr. Bond? Yes; I paid him that sum. He had a lot of trouble in the matter.
8658. Upon the 9th October, 1891, the Minister instructed the Engineer-in-Chief to re-call for tenders for this work, did he not? I could not tell you.
8659. On 22nd February, 1892, at all events, a notice was sent to the *Gazette*? I believe that was about the time the matter was re-advertised.
8660. Had you any knowledge of the fact that it was to be re-advertised—did it come to your knowledge? Not that I am aware of.
8661. How came it then, that Mr. Hickson upon the next day—that is 23rd February, 1892—wrote as follows:—

Since writing my minute of 6/10/91, complications have arisen with Carter & Co., *re* their Contract No. 72 having been stopped. They have made large claims on this account, some of which no doubt could not be entertained, but on some items they have made a good case. They are prepared, if they obtained this work, to waive all claims on No. 72. As their tender is a reasonable one, and some £3,600 below the estimate, I think it might fairly be accepted. If this course were adopted, work would be given at once to a large number of men.—R.H., 23/2/92. Under Secretary. Important.

? I could not say.

8662. When did you put in the claim which has been referred to in connection with Contract 72? The papers are here, and I daresay if I referred to them I could give you the date.
8663. Did you between the 22nd and 23rd call upon Mr. Hickson? Possibly.
8664. Had you any conversation with him? Certainly, if I called upon him.
8665. Do you not remember whether you called on him with reference to your claim? Certainly I did; but I do not remember the dates.
8666. Was it after you heard that there was to be a *Gazette* notice? I did not hear of it, and I have already said so. I may have called upon Mr. Hickson repeatedly on various businesses.
8667. But did you have any chat with Mr. Hickson as to the nature of your claim? No. Mr. Hickson would not discuss it with me. He repudiated it entirely. That minute of his which you read has until recently been news to me. I did not know his opinion on the subject.
8668. In connection with Contract 72, I believe the claims referred to consist of these items:—"Rent of Knight's paddock, £10; sandstone for concrete, broken and stacked, £400; Portland cement, £958 15s.; loss on sale of cement, £250; gratings, £87 10s.; manhole covers, £30; interest on expenditure, £64 4s. 6d.; valuation of plant on ground for completion of contract, £500; loss on profit on work withdrawn, £1,750—making a total of £4,050 9s. 6d."? Yes. [*Vide Appendix No. 33.*]
8669. What was the date of that claim? 15th February, 1892.
8670. The date of your obtaining this contract is 23rd February, 1892, so that the two dates are very close? Yes.
8671. How long before you sent in your claim had the work upon Contract 72 been stopped;—had it been stopped six months? Possibly.
8672. You sent in your claim upon 15th February, and on 23rd Mr. Hickson wrote his minute? Yes.
- 8672½. Is it not a fact that Contract 72 was re-started within a fortnight after the matter in connection with Contract 79 was settled? I do not think so; but it may have been. I know that it was re-started, but how and when I cannot say.
8673. On 12th October, 1891, Mr. Hickson stopped the contract? Yes; I believe that was the date. [*Vide Appendix No. 34.*]
8674. And in April, 1892, you re-started it? Yes.
8675. When you re-started Contract 72 did not this entire claim of yours disappear? Not necessarily.

J. Carter.  
13 July, 1896.

8676. Take the rent for Knight's paddock—would not that disappear? No.
8677. Take the sandstone for concrete, £400—would that be used? Yes; certainly.
8678. Take the Portland cement—would that be used? Yes.
8679. Then there is loss of sale upon the cement,—would that be lost? Yes; because I had bought cement to arrive for other contracts, and also for Shea's Creek, so that we had too much in stock.
8680. What did you do with the 2,000 casks? I transferred it to North Shore and Waverley—some to both places, I think.
8681. Then it was used? Yes; but what about the carting and the interest on the money, and the high price as compared with the cheaper price afterwards.
8682. Then take gratings, £87 10s.—did not the Government take them off your hands and pay you for them? I could not say now.
8683. Take the manhole covers at £30—they were not lost? No.
8684. Then take the interest on the expenditure, £64 4s. 6d.? That is neither here nor there.
8685. Then there is the valuation of the plant on the ground for the completion of the contract, £500—that was not lost; and there was also a loss of profit on the work withdrawn, £1,750—that is not lost? No; I hope not.
8686. Then really there was no claim? Certainly, there was.
8687. Where did it come in? Because the contract had been taken from us.
8688. Was it not intended all along that this work should go on when the Estimates were passed? Certainly not. At all events, we had no intimation to that effect.
8689. Then by what arrangements did you get the job on afterwards? There was no arrangement that I know of. We were told to go on with the work. The Department wrote to us, and told us to go on with it.
8690. Did they ask you for any consideration in the letting of Contract 79? No; I do not see why they should.
8691. In connection with your purchase of cement—as a matter of fact, you do not always take delivery from merchants—you do not have from two to five thousand casks sent out to the works? Yes, certainly; we do not want to handle it several times.
8692. Would it not be better to leave it in the merchants' stores? No; that would put 6d. or 8d. a cask on to it, to pay for storage and handling.
8693. Where had you this 2,000 casks of cement stored? At Shea's Creek.
8694. In a shed there? Yes; we had four cement-sheds, if I remember rightly.
8695. Did you have any inspection by an inspector of works upon Contract 72 prior to your signing the contract for 79 a short time previously? I really could not say. If the official correspondence says so, I presume it occurred, but I do not remember it.
8696. When you obtained Contract 56, did you enter into any negotiations with Bond and Hudson to withdraw their tender? No; I do not know them.
8697. Do you know Mr. Bond now? Yes, slightly, I met him half a dozen times, I suppose.
8698. *Mr. Gummow.*] As to Contract No. 72, if payments were made to you on 20th January, 1892, would not your claim have been put in after that date? Yes.
8699. But it would not be months after the completion of the contract? No. Of course, I could not put in any claim until I got payments upon which to base the claim. The details had to be worked out. They were not worked out by me.
8700. Who worked them out? Mr. B. C. Simpson.
8701. Do you not consider that you suffered a great loss through delay? Yes.
8702. Do you know why Contract 72 was started again? I have no idea, except it was necessary to go on with it.
8703. Do you think it likely that the municipal council and Members of Parliament for the district might have been hurrying on the Government in the matter? Probably.
8704. It would not be due to your action? I never approached them on the subject.
8705. When Contract 79 was accepted did you know if you were going to get the continuation of Contract 72—had you any idea of it? Not the faintest.
8706. As to Contract 56—the Potts' Point contract—Bond and Hudson were the lowest tenderers, and Gummow and Gillan were the second lowest? Yes.
8707. Do you think that Gummow and Gillan were fairly treated in not being allowed to go on with that contract? No; I do not.
8708. Do you think they should have got that contract? Yes, being the second tenderers, and their price being exposed. If the prices had not been exposed, we should not have beaten you the second time.

George Christie, recalled and further examined:—

8709. *Mr. Smith.*] I think the other day you told us that in your investigation you had come to the conclusion that the transaction of Mr. Carter with Mr. Weedon, relative to the £2,000, was not a private transaction between himself and Mr. Carter, but was a transaction between Mr. Weedon and the firm;—  
8329? That does not refer to the transaction with Mr. Weedon, but to sundry cheques.  
8710. Turn to Question 8326;—do you not agree that it was a private transaction so far as Mr. Weedon and Mr. Carter were concerned? As regards Mr. Weedon, I cannot say. As regards the object of obtaining the money, I would distinctly say that it was for the benefit of the firm.  
8711. You said in reply to His Honor that you could draw only one inference from the transaction? Yes; Mr. Weedon handed Mr. Carter a cheque, which Mr. Carter paid into the firm's account, and the firm were wanting money at the time.  
8712. So far as Mr. Weedon is concerned, you do not dispute Mr. Carter's evidence that this was a private transaction between himself and Mr. Weedon? I cannot give any evidence, of course, as to what may have taken place between Mr. Weedon and Mr. Carter; but it seems to me clear that the money was obtained from Mr. Weedon for the benefit of the firm, and you have also the fact that the firm needed the money. Mr. Carter is the leading member of the firm, and whether he wanted money for himself privately, or for the firm, does not seem to me to matter very much. It is almost impossible to  
my

G. Christie.  
13 July, 1896.

- G. Christie.  
13 July, 1896.
- my mind to draw a distinction between Mr. Carter as an individual, and Mr. Carter as a leading member of the firm of Carter, Gummow, & Co.
8713. *Mr. Parkes.*] The benefit of the transaction having been derived by the firm? Yes.
8714. *Mr. Smith.*] Is there not a great difference between the lending of money to an individual and to a firm? I cannot see that in this case there is much difference.
8715. Will you look at the memorandum which I now hand you? Yes. It reads as follows:—

MEMORANDUM of charge made the seventeenth day of June, one thousand eight hundred and ninety-five, by John Carter, of North Sydney, contractor (hereinafter called mortgagor), in favour of Stephen Henry Weedon, of North Sydney (hereinafter called mortgagee). Whereby in consideration of the sum of two thousand pounds lent to the said mortgagor by the said mortgagee upon the execution of these presents (the receipt whereof the said mortgagor doth hereby acknowledge), the said mortgagor doth hereby charge all those the lands comprised in the deeds and certificate of title mentioned in the Schedule hereto (which deeds and certificate have this day been deposited by the said mortgagor with the said mortgagee), with the payment by the said mortgagor to the said mortgagee of the sum of two thousand pounds on the first day of June one thousand eight hundred and ninety-seven, and also interest on the said sum, until payment thereof, at the rate of six pounds per centum per annum, such interest to be paid half-yearly, on the first day of December and the first day of June in each year. In witness whereof the said parties have hereunto set their hands and seals the day and year first before written.

THE SCHEDULE.

- 13 June, 1892. Conveyance, J. W. Johnson and others, first part; The New South Wales Property Investment Company, Limited, second part; J. P. Wright and others, third part; Augustus Morris, fourth part; and John Carter, fifth part—registered number 541; Book 501.
- 4 January, 1888. Conveyance, Thomas John Cook to John Carter; registered number 906, Book 514.
- 27 February, 1867. Conveyance, Thomas John Fisher to Thomas Ellen; registered number 463, Book 102.
- 4 December, 1868. Conveyance, Thomas Ellen to Edward Carter; registered number 1,000, Book 156.
- 29 May, 1894. Certificate of Title, volume 1,128, folio 191, in name of John Carter.

Signed, sealed, and delivered by the said John Carter, in the presence of,—

JOHN CARTER.

F. M. GUMMOW.

Received on the day and year first within written, of and from the within named Stephen Henry Weedon, the sum of two thousand pounds, being the consideration money within expressed to be paid by him to me.

JOHN CARTER.

Witness—F. M. GUMMOW.

We, the undersigned, hereby certify that the typewriting above and on the preceding page of paper is a true copy of the original memorandum of charge, the same having been compared therewith by us this thirteenth day of July, 1896.

T. C. BLUETT, } Clerks in the Bonds and Contracts Branch  
W. M. CLANCY, } of the Public Works Department.

8716. When was it executed? I see that it was filled in with the date, 17th June, 1895.
8717. *Mr. Parkes.*] Is the document registered? No.
8718. *Mr. Smith.*] It is a memorandum of charge from Mr. Carter to Mr. Weedon. It is a matter between those two and those two only? That is what it purports to be. It is an equitable mortgage. It is not an ordinary business transaction.
8719. And you know, as a matter of business, that there is a great difference between a document of that kind, as between two individuals, and a lender of money and a firm? I have no evidence to give upon that point. I cannot comment upon what may have taken place between Mr. Carter and Mr. Weedon.
8720. But you are here, I take it, as an expert in matters of account, and I ask you as an expert whether there is not a great difference between a loan such as this purports to be, from an individual to an individual, and a loan to a firm? I cannot distinguish between Mr. Carter, and Carter, Gummow, & Co., because they are so connected in this matter. Besides, I take it that Mr. Weedon is not an outside friend. The connection is through the contracting firm. There is one series of connections.
8721. *Mr. Gummow.*] How do you know that Mr. Weedon is not an outside friend? Well, from the time Mr. Weedon has been in the Colony and his connection with the Sewerage Department.
8722. But I ask you how you know that he is not an outside friend? Of course I can only express an opinion.

Stephen Henry Weedon examined:—

- S. H. Weedon.  
13 July, 1896.
8723. *Mr. Smith.*] You are a civil engineer? Yes.
8724. You are in the employment of the Public Works Department? Yes.
8725. What are you doing at the present time? At the present time I am surveying.
8726. In the country? Yes.
8727. You know Mr. John Carter? I do.
8728. Some time last year there was a transaction between yourself and him relating to a sum of £2,000? Yes.
8729. Will you state how it came about—that is to say, what was the beginning of it? Last December twelve months, I came into a little money through the death of my father. At that time, I was in charge of a contract for which Mr. Carter was one of the contractors.
8730. What was that? 79A.
8731. I believe you succeeded Mr. Boys there? Yes. When I knew that I was going to have a little money I thought of building, and at different times I had spoken to Mr. Carter as well as to other persons, and had consulted him about the price of land, and what a house would cost, and that sort of thing. In the month of March I was told I was going to be removed from the work I was in charge of and that I was likely to be sent into the country. I therefore gave up the idea of building, seeing that I was so unsettled, and I asked one person and another whether they could give me any advice as regards the investment of the money. I spoke, among others, to Mr. Carter. I was then sent away to do some work elsewhere, and in the meantime Mr. Carter made me an offer. He said that he was paying 8 per cent. for an overdraft, and that if I found I could not do better he would give me 6 per cent. for my money and would give me security for it. He told me at the same time that, if it should so turn out that I at any time wanted the money, I could, if I gave him reasonable notice, get it back. It was a friendly sort of transaction, and in that way I came to lend him the money upon the security which you have before you.
8732. This security was drawn up at the time? I presume so. That is what was handed to me when Mr. Carter got my cheque.
8733. You gave the cheque, and Mr. Carter handed you over that memorandum of charge as security? Yes.

8734.

S. H.  
Weedon.

13 July, 1896.

8734. The transaction was between yourself and Mr. Carter, and not between yourself and the firm of Carter, Gummow, & Co.? Quite so.
8735. You have not been over any of the contracts of this firm since that transaction? No.
8736. And the money was lent after you had left Contract 79A? Yes.
8737. Have you known Mr. Carter for any number of years? Since I have been in New South Wales—since 1891.
8738. *Mr. Gummow.*] Can you tell me what firm prepared this memorandum of charge? Messrs. Johnson, Minter, and Simpson.
8739. When did you pay your cheque to Mr. Carter—do you remember the date? It was drawn on 17th June.
8740. Upon what date did you get your interest? From 1st June.
8741. How was that? I should have paid the cheque before, but I was away at that time, and Mr. Carter said it was not worth while making the date 17th June. He said we had better date the transaction from the 1st of the month.
8742. How did you get paid this interest of 6 per cent.? It was to have been paid half-yearly, but after the first quarter I had a cash payment. I had various payments to make, and I asked Mr. Carter to let me have the payment for the first quarter in advance. He gave me the first quarter in cash as I wished it so. I had some outstanding accounts and I wished to pay them.
8743. Do you know how you received the second and third payments? The second payment was by cheque paid into my account, and the third payment was made in cash.
8744. Why was it made in cash;—was it for any particular reason? I asked Mr. Carter to let me have it in cash because I wanted to pay it into the Savings Bank. I was only up for the day from Wollongong, where I was at work, and I asked him to let me have the payment in cash so that I might put it into the Savings Bank at once.
- 8744½. When you were lending this money did you take security from any parties other than Mr. Carter? No.
8745. Were any other names used? No.
8746. Do you know who witnessed the transaction? I was not there when the document was made out; but you witnessed it, apparently.
8747. *Mr. Parkes.*] When was the deed drawn up? I do not know.
8748. Was it drawn up lately? Not according to the date upon it.
8749. Has it not been drawn up lately? It has been in the bank ever since I received it.
8750. Will you look at the blotches in the ink and also at the signatures? I do not require to look at it, because I know that it has been in the bank. I went to the bank myself and got the document out.
8751. Why did you not get the document registered;—would not your solicitor register it? I had not a solicitor.
8752. Would not the solicitor who drew the document for you be likely to get it registered? I did not see him about it.
8753. From whom did you get the document? From Mr. Carter.
8754. *Mr. Smith.*] It was then deposited with the bank? Yes.
8755. *Mr. Parkes.*] Before coming to this Colony were you not in the Public Works Department in Brisbane? Yes.
8756. In what years? Up to 1886.
8757. Under a Mr. Ballard? No.
8758. He was chief of the department you were in? No; he was the chief in North Queensland. Mr. Stanley was the chief engineer for the Southern and Western lines.
8759. Did not Mr. Ballard have some question raised about the placing of money of his at fixed deposit with a contractor? He lent money to contractors who were working for him.
8760. All through Contracts 79 and 79A you were the resident engineer? No.
8761. You were acting on Contract 79 on February 19, 1894, were you not? Mr. Boys was in charge upon 79.
8762. But were you not acting there as well as Mr. Boys? No. I think I relieved him for a few days.
8763. Did you not on 20th February, 1894, recommend that Inspector Reid be removed on account of his quarrelling with Mr. Carter's men? I know the thing cropped up while I was relieving Mr. Boys.
8764. Did you not write this minute?

When I first observed mixed concrete on the board at mouth of Shaft No. 5, and found from Inspector Reid that it would not be used before evening, I pointed out to him that this was too long for it to stand, for, though mixed dry, the stone had been soaked with water and the sand wetted by the rain. He told me the matter had been inquired into and settled by yourself and the contractors. I am still of opinion that it is detrimental to the strength of the concrete for the cement to be mixed for hours with the other wetted materials before going into the work. [I beg to point out that such friction as is evident by this report, between our inspector and the contractors' men, should be put a stop to at once by removing the offending party from the works, as no satisfactory work can be done under the strained conditions obtaining at present. S.H.W., 20/2/94. Mr. Davis.]

Yes.

8765. Your signature, I notice, is attached to minutes right through the papers in connection with Contract 79 showing that you were in close connection with the work. For instance, on page 331 of the Parliamentary papers you will see this minute by Mr. Davis—"Mr. Weedon to see that the surplus material is delivered to the places named." That is dated 21st August, 1894. Almost from the beginning of the contract you seem to have had some connection with it. For instance, you reported upon the case of alleged sweating on the North Shore contract, did you not? Yes; I reported on that.
8766. You were engaged in supervision all through Contract 79A, were you not? Not all through.
8767. During the greater part of the work, at all events? No. I took up the work at an early stage, but there was a good deal to do when I left it. I do not know whether it is finished even now.
8768. I see from the papers that in October, 1894, you wrote a letter, and I observe there are minutes following that which are noted by you. Then Mr. Davis writes, "Mr. Weedon to see about this," in allusion to the substitution of brickwork for concrete. Your name appears right through the papers in connection with the contract. You must have been engaged upon it right through the job? I was engaged upon that job until it was handed over to the Water and Sewerage Board, on 8th April, 1895.
8769. When the greater part of the work was done? No

8770

S. H.  
Weedon.  
13 July, 1896.

8770. In what condition was the job when you left it? There were most of the shafts to build and the tunnel lining to go in.

8771. On what date do you say it was handed over to the Water and Sewerage Board? On April 8th, 1895.

8772. All through the work up to that date you acted upon it, did you not? I was practically in charge of the work up to that date. The shafts were sunk when I took it over from Mr. Boys.

8773-4. What did you do when you left that contract? I was given charge of other contracts for a short time. On April 9th I was instructed to take charge of Contract 110 at Clay Cliff Creek, Parramatta. Then there was 79A, Rookwood Cemetery drainage; then No. 109, Kensington storm-water channel; and No. 116, Easton Park, Balmain.

8775. You also had to do with Contract 69 at Marrickville? I relieved Mr. Milner once when he was on his holidays.

8776. For how long? He was away six weeks, I think.

8777. It was you who recommended that the filling that was to be done for the altered work, the substitution of one sewer for two, was to be paid for—not at 6d. per yard as in the contract, but—at 5s. a yard? I cannot remember that.

8778. Mr. Davis, on 17th November, 1894, wrote: "Will Mr. Weedon please let me have quantity of filling?" And in reply to that you say, "Quantity of filling due to alteration in design, 410 cubic yards." Mr. Davis, on 21st November, writes as follows:—

The schedule rate for filling is 6d. per cubic yard, but it is manifest that the contractors, in giving this low price, did not contemplate doing the kind of filling required in connection with the western branch sewer, between Premier-street and Illawarra Road. The 5s. asked is, I consider, a little high, but I suppose, as they will lose something by the reduction of concrete and brickwork, occasioned by the alteration, it will be just to take this into account, and allow them what they ask. There will be about 400 cubic yards of this filling, which at 5s. per cubic yard, would amount to £100. I recommend that the price named be approved.—J.D., 21/11/94. Commissioner and Engineer-in-Chief for Roads, Bridges, and Sewerage.]

Then following that there is this minute by Mr. Hickson:

This addition is caused by an alteration in the original design, which has the effect of reducing the cost of the work in this contract by about £750, and a further reduction on the whole work of £10,000. Recommended for approval.—R.H., 21/11/94.

I suppose it was upon your report that this recommendation was made? I could not be sure now, it is so long ago. I cannot remember these things at a moment's notice; I was only there for six weeks.

8779. Were you on the work when the substitution of a single sewer for a double one was carried out? I believe it was started; I think some of the tunnelling was done.

8780. Was any of the work done during the time you were there? I was only there six weeks. They were not working at the Premier-street shaft then.

8781. Were they working in the tunnel? I do not think they were, but I could not be sure without looking the matter up.

8782. *Mr. Smith.*] The deed which is produced to-day was given by you to the bank? It was lodged with the bank on 17th June, 1895, and I obtained it from the bank to-day on hearing that you wanted it.

8783. *Mr. Parkes.*] It was you who measured up the work upon contract 72? Yes.

8784. At Shea's Creek you had charge of the work all the way through had you not? That was the first work I did.

8785. That was the first contract you went on after you came to the colony? Yes.

8786. When that contract was completed, what quantity of cement had Carter, Gummow, & Co. in their store upon that work? I could not tell you.

8787. Used you not to make a return of the cement in the store? I do not think that on that contract they had any advance upon cement.

8788. Did you not notice what stock they kept. How big was the shed? They had a big shed in a paddock across which we cut with the sewer.

8789. Do you recollect a claim being sent in for a stoppage of contract 72? Yes.

8790. Did you report upon that? I think not.

8791. Do you recollect how much cement was in stock then? No. I never kept any account of it.

8792. Did you have to test the cement? Certainly, it was tested.

8793. Did you test it? No.

8794. Was it your duty to see that the cement used was good? It was my duty to see that only tested cement was used in the work.

8795. Therefore, you would know how many casks were in the shed? No; I had no check upon what they had.

8796. Suppose they had 2,000 casks in the shed on the completion of the job, would you not know that? I might know it, or I might not know it. I know that a large quantity of cement was stored there.

8797. How many casks? I could not pretend to say how many. Unless they got an advance upon the cement I should not have any reason for taking account of it.

8798. *Mr. Gummow.*] As to contract 72—the Munni-street contract—did you supervise the whole of that work? Yes.

8799. Where from? From the junction with the old work—from where the Munni-street branch started.

8800. Did you supervise the whole of the work which Carter & Co. carried out from Munni-street to Shea's Creek? No; what I had charge of was a short branch from the main sewer. Parry and Farley did the top piece of that.

8801. Who did the lower part of the work? Carter & Co.

8802. You had nothing at all to do with the lower part? No; I have been on it. I think I gave Mr. Boys a day's levelling. I know I did some work there one day.

8803. Would you know when the lower part was finished and when it was stopped? No.

8804. Would you know whether the part you supervised was a part of the original Shea's Creek Contract? If I remember rightly it was upon the same schedule. It was like an extension of the original contract.

8805. You do not know whether the part you supervised was part of the original contract? No, not positively.

8806. Do you know anything about the claim made by Carter & Co. upon the Department? If you mean the claim in connection with the delay upon the work, that was never brought before me.
8807. Had you charge of Contract 72 before it was stopped? No, not below the Munni-street branch.
8808. You merely had the portion which it was ordered should be proceeded with in April, 1892? That would be it, I expect.
8809. You do not know what cement Carter & Co. had in stock when the work was stopped? No.
8810. Who had charge of the work? Mr. Boys I believe.
8811. You were not there when the contract was stopped originally? No.
8812. You had nothing to do with that? No.
8813. You merely came on when the extension was ordered to be proceeded with? That is so.
8814. As to Contract 69, you were there for about six weeks? Yes.
8815. You merely relieved Mr. Milner when he was away on a holiday? Yes.
8816. During the time you were there, some stone-filling was ordered to go in? I am not prepared to say without looking through the diary I kept.
8817. Will you look at page 131 of the Parliamentary Papers;—you will see there a letter from Carter, Gummow, & Co. to the Engineer-in-Chief for Sewerage with regard to the alteration of design between the Premier-street shaft and the Illawarra Road, and stating that they would accept the terms in the Department's letter of 11th October if a special item were arranged for the filling at the rate of 5s. per cubic yard; the minute following that letter, stating the quantity of filling in the alteration of design, is initialed by you? Yes.
8818. That minute of yours merely stating the quantity of filling due to alteration in design could not be construed into a report that Carter, Gummow, & Co. should be allowed 5s. a yard for filling? No; my minute was merely written under instructions from Mr. Davis.
8819. You did not recommend the 5s. a yard if it does not appear upon the papers? No.
8820. Were you the resident engineer upon Contract 79? No.
8821. Who was the resident engineer upon that contract? Mr. Boys.
8822. How did you come to initial and sign papers in connection with it? That is while I was relieving him when he was away upon a holiday, I think.
8823. Were you there long? Not more than three weeks.
8824. How many times did you take charge of that contract? I could not be sure, but I think only twice.
8825. That is how it comes about that your initials are appended to some of the papers in Contract 79? Yes.
8826. You were merely there temporarily relieving another officer on his holidays? Exactly.

S. H.  
Weedon.

13 July, 1896.

Henry Melville sworn and examined:—

8827. *Mr. Parkes.*] You were at one time an inspector for the Government upon sewerage works? Yes.
8828. What works were you inspecting? I was on the main sewer at Bondi first of all with Mr. Smail. Then I was at Bourke-street. From that work I was transferred to Parramatta, and then back again down to Bondi and Double Bay.
8829. Were you an inspector upon any of Gummow and Gillan's contracts? I was an inspector on Mr. Gummow's work in Hyde Park.
8830. Were you an inspector upon any work undertaken by Carter, Gummow, & Co.? No.
8831. Was any member of the firm of Carter, Gummow, & Co. associated with any work over which you had supervision? Besides Mr. Gummow's contract which I have just mentioned, I was inspecting work done by Mr. Snodgrass, Mr. Gillan, Mr. Ewing, and Mr. Mathieson, in Abercrombie-street.
8832. How long were you over that work? I was about eighteen months in Abercrombie-street over Mr. Snodgrass's work.
8833. During that eighteen months was a man working there named John Reid? Yes; he was supposed to be gauging cement for the bricklayers and sending down concrete and compo.
8834. What sort of man did you find him? I had a great deal of trouble with him at various times.
8835. What sort of man did you consider him? I looked upon him as a man who had to be watched to make him do his work properly.
8836. During the whole of the time you were there? Yes; I constantly came into conflict with him—once at Thomas-street severely.
8837. Did you ever report him to the Department? It was not "systematical" with me to report him. I used to make him take out work when I found any bad work going in.
8838. To what class of bad work are you now referring? I mean the gauging of the bricklayers.
8839. How did he do bad work in that case? He was supposed to gauge 2 to 1—16 feet of stone, 8 feet of sand, and 4 feet of cement.
8840. What used he to do? Well, I ordered up some stuff which he had once sent down at Thomas-street.
8841. *His Honor.*] Why? Because there were not the proper quantities in the stuff.
8842. In what way? The quantities should be 2 to 1 for the compo. used for the brickwork.
8843. What did he make it? I found it 3 and 4 to 1.
8844. *Mr. Parkes.*] By that means he saved about a barrel of cement in the yard? Not quite a barrel. It would be about three-quarters of a barrel, I should think.
8845. Was he not a source of annoyance to you from the beginning to the end of the work? Yes; I could not pay attention to the men individually, because I had all the brickwork to look after, from one end of the job to the other, and a lot of things might have been done which I did not see.
8846. Did you catch Reid doing bad work a dozen times? I could not be certain that I caught him a dozen times, but I think you might say seven or eight times.
8847. Did Mr. Davis come on to the job? He had nothing to do with that contract; it was under Mr. Wade. Mr. Davis was over the contract from Hyde Park to Balfour-street.
8848. For what reason were you removed from the Department? I was supposed to be removed for allowing bad work to be done. That would be under Mr. Davis, out at Brown-street, Paddington.
8849. What contract was that? Gascoigne's, Heeney's, and Tracey's.

H. Melville.

13 July, 1896.

8850.

- H. Melville. 8850. You received a letter from Mr. Davis? Yes; it is dated 7th February, 1893, and is as follows:—  
 “Mr. Henry Melville having applied to me for a certificate as to his fitness to undertake the drainage of houses, I have pleasure in stating that for about seven years he was employed in the Sewerage Branch of this Department as inspector supervising important works, and since then for over twelve months as foreman for Messrs. Jones and Atherton, on one of our largest and most important contracts. His experience gained in this way should fit him to carry out any drainage works.”
- 13 July, 1896. 8851. Were you told that you had been allowing bad work to go in? Yes.
8852. As a matter of fact, were you allowing it? As far as I could judge, Mr. Davis found fault with me for not getting 6 inches of concrete put round a 24-in. pipe. I should like to mention that another man was dismissed from the same contract—a man named John Brown—because he allowed bad pipes to go in. I had orders to remove all these pipes inside of twenty-four hours, and I believe a complaint was lodged against me that I allowed the same pipes to go back again, which I emphatically deny.
8853. Did the contractors complain of the way in which you dealt with them? Yes. There were constant complaints right through the contract as to my severity.
8854. Were you ever threatened with removal by any contractors' workmen? I was threatened with removal by Mr. Pritchard at Double Bay.
8855. But were you threatened with removal by anyone belonging to Carter, Gummow, & Co.? No.
8856. You said you were inspecting on a work which Mr. Gummow did? Yes.
8857. How did his men behave? A report went into the office that concrete was put in one morning mixed with pure sludge from the bottom of a shaft. That was reported to Mr. Wade. Mr. Davis was conversant with the facts.
8858. Did you take any of this stuff from the position in which it had been fixed? I found it at the top of the shaft when I went there early one morning. I had charge of the concrete, and another man had charge of the brickwork.
8859. Besides Jack Reid, there was a man working on that contract named Bandeen? Yes; he was a man who was not to be trusted. I was always coming into conflict with these men, and Mr. Davis heard of my doing so on various occasions. It was over concrete and various other things.
8860. You mean that you came into conflict with them over the bad work they did? Over the mixing and gauging.
8861. Could you mention the names of other men who did bad work upon that job? Not on that job.
8862. According to Mr. Davis' letter you worked under Jones and Atherton;—had Mr. Carter anything to do with that work? Only when I first went there for employment. He withdrew, and the firm of Atherton and Jones carried out the contract.
8863. Where did the work run to? From Castlereagh-street to the Argyle Cut.
8864. You were a contractor's foreman? Yes.
8865. Did you see defective work going into that job? I could not make myself answerable for all the men down there, because I had all the work to supervise from one end to the other.
8866. Was any bad work going on? They made me take out the crown of the shaft at No. 16, Harrington-street.
8867. Was there any bad work there? The inspector said it was bad work, and Mr. Davis had it taken out. I myself did not think it bad work; I have seen plenty worse.
8868. How was the packing done upon that job? I was not always down below to see what the packing was like.
8869. Was any timber once put in the packing over the sewer for concrete? No.
8870. Do you know whether any timber was put in as concrete at any time upon that contract? I could not be answerable for that.
8871. *His Honor.*] Did you hear of its having been done? No.
8872. Did you suspect that it was done? No.
8873. *Mr. Parkes.*] Was the packing on that job well done? As far as I know, it was. I could not always be present when that work was being done.
8874. Coming to the work in which Mr. Gillan and Mr. Snodgrass were interested in Abercrombie-street, was there any defective work there? A man named Johnson was put away from that work by Mr. Wade for bad packing.
8875. Was a man named Stone also put away? He never worked on that contract.
8876. Was any other man put away? A man named Malcolm, a bricklayer.
8877. Any other men? Not that I know of.
8878. As regards Reid, you positively assert that you have caught him putting in insufficient cement into the compo.? Yes; I stopped him from doing so at the shaft at Thomas-street, and I had the stuff taken out.
8879. Did you stop him from doing that more than once? Yes, and I had the stuff put into a bottle to test it.
8880. And you found it defective? Yes.
8881. *Mr. Smith.*] You did not report him? It was not “systematical” with me to do that. When I found bad work I had authority from the engineers to have it taken out; I remember, upon one occasion, fetching Mr. McMordie out at 2 o'clock in the morning. That was on a section of the Double Bay work—the contract that Mr. Pritchard finished.
8882. *Mr. Gummow.*] With regard to the contract in Abercrombie-street? You had nothing to do with that.
8883. Had Mr. Carter any connection with that contract? No; I was not over any work in which you and Mr. Carter were concerned together.
8884. Was Mr. Forrest interested in the work? No.
8885. Take the work in Harrington-street—was I interested in that? No.
8886. Was Mr. Gillan interested in that? No.
8887. Was Mr. Forrest? No.
8888. Was Mr. Carter? He was one of the three contractors when I first went there, but he withdrew from the contract, as I was given to understand. I do not know anything about his object in withdrawing. I am not supposed to know his business.
8889. Was he ever one of the contractors for the Harrington-street contract? He held a tender for the contract with Atherton and Jones, but he left it. He was there for about a fortnight after the work started.
- 8890.

8890. Was he there when the bad work which you were ordered to take out was done? I know he left H. Melville.  
the firm. I know nothing further about him than that.
8891. Was he there, do you know, when any bad work was done? Not that I know of. He was there 13 July, 1896.  
a fortnight, as I have said.
8892. As to the Hyde Park contract in which you say I was interested, you say that some sludge was  
used in the concrete? Yes; the stuff was taken out, and some of it was sent into the office at Riley's  
Chambers, Bathurst-street.
8893. Were you head inspector? No, Gledhill was.
8894. He was over you? No.
8895. What were you then? We held two distinct positions. I had the concrete to look after and  
Gledhill had the brickwork to look after. It was early one morning when I found this stuff going down  
one of the shafts. A man named Shellback was putting it down.
8896. What happened to him? I do not know; but a sample of the stuff was taken out of the shaft,  
and was placed before Mr. M'Mordie by Mr. Wade's orders.
8897. Did Shellback continue on the contract? Yes.
8898. He was not removed? No. The responsibility of removing him was left upon Gledhill's shoulders.
8899. Was the man who did this bad work kept upon the contract? Yes; you persisted in keeping him  
on.
8900. You were on the outlet works at Bondi? Yes.
8901. You may remember that I was there too? Rather.
8902. You had charge of the concrete work? Yes.
8903. Whose gang were you supervising? Banteen's principally.
8904. Had you occasion to find fault with him for the carrying out of the work? Yes—more than once.  
I was always checking him in his gauging of the stuff on the board.
8905. As a matter of fact were you not always well satisfied with the way in which he carried out his  
work;—have you not spoken about the splendid quality of his work, and about the great amount of work  
which he could put through in a day? I was satisfied with the amount of work he put through.
8906. Was it put through in a proper way? I think that if I had not been there to keep him in his place  
the work would not have been done as well as it was.
8907. *Mr. Parkes.*] By keeping him in his place you mean keeping him straight? Yes.
8908. *His Honor.*] What sort of man was Reid;—was he given to drinking? Yes.
8909. Was he often under the influence of drink when he was upon the works? I have seen him once or  
twice under the influence of drink on the works. What he did off the works was of no business of mine.
8910. When he was doing the bad work to which you have referred was he under the influence of drink?  
I do not think so.
8911. When he did improper gauging, for instance, you think he knew what he was about? Yes.
8912. *Mr. Gummow.*] Is it not a fact that you are a natural grumbler? I am much obliged to you for  
the compliment. There is one thing I should like to mention. Through the kind influence of yourself, I  
presume, I have been shifted out of Government employ. I was a nuisance to you because I would not  
allow your men to do bad work.
8913. *His Honor.*] Then you say that you are not a natural grumbler? No man who has charge of these  
contracts can always control his temper. I was thirteen years in the employ of the Department. And under  
Mr. Bennett I lost one of my hands. Finally I got dismissed as I have told you. Mr. Gummow knows  
very well that at the time of the job in Hyde Park he would not speak to me for three weeks because I  
would not allow him to do what he liked. It was a question of his tearing the ground to pieces. I would  
not sanction the measurements without their going to Mr. Wade. I was sent from Abercrombie-street to  
stop Mr. Gummow from tearing the ground to pieces.
8914. When you say that Mr. Gummow persisted in keeping Shellback on the work what did you mean?  
I was referring to what occurred under him. The inspecting work was divided between Gledhill and  
myself. I was supposed to look after the concrete; but I could not see all the stuff that went in, because  
the inspector is not supposed to go on to the works until 9 o'clock in the morning, and the men start at  
7 o'clock.
8915. There is plenty of time for them to do bad work before the inspector is there? If they choose.
8916. Did Gledhill report Shellback, do you know? I reported him to Mr. Wade. I know nothing of  
what took place between Mr. Wade and Gledhill; I know that I went there one morning at twenty  
minutes to 8 o'clock and saw this bad stuff going down the shaft. I did not think it ought to be allowed  
in justice to the work itself, and I reported it to Mr. Wade, who had some of the stuff taken into the  
office.
8917. Then did Gledhill try to get Shellback taken off the work? I cannot say. The matter was taken  
clean out of my hands.
8918. All you know is that Shellback remained? Yes.
8919. You do not know how that came about? No.
8920. *Mr. Parkes.*] Used Mr. Davis at any time to read the bible to you? He told me that I would  
never go to Heaven if I were not a better man.
8921. Used he to give you lectures upon religion? Yes.

WEDNESDAY, 15 JULY, 1896.

Joseph Davis recalled and further examined:—

8922. *Mr. Parkes.*] Will you tell His Honor from the specifications of Contract 79 the nature of the concrete  
used for making the invert of the sewer—that is to say, the bluestone concrete of 4, 2, and 1, and 7, 3, and  
2, and the sandstone concrete of 5, 2, and 1? If you look at clause 27 of the specifications, which you  
will find upon page 280 of the Parliamentary papers, you will see that it is as follows:—

27. All concrete to be prepared close to where it is required on sawn timber plank platform, all proportions to be  
correctly ascertained by measurement, the metal to be well washed when put on the platform and levelled at top, the  
sand to be placed in a level layer above the metal, and the cement to be placed upon the sand; after which all materials to be  
carefully mixed and turned twice over, and then the whole to be mixed with fresh clean water, and thoroughly turned  
over twice, and oftener if required, until, in the opinion of the Engineer, it shall be well incorporated and fit for the work  
before it leaves the platform; it shall then be at once conveyed to the works as shall be directed; and to be used fresh.

J. Davis.  
15 July, 1896.

8923. That concrete has to be put in in certain layers, and then grouted with a special cement—that is to say, one layer of concrete is put on and it has to be grouted before the next layer is put on? Where the engineer requires that to be done. The grouting is usually done at the beginning of the day, when the concrete has had time to set.
8924. But the work has to be carried out right through layer by layer, with grouting between? The work has not been carried out in that way.
8925. Is that not according to the specification? The specification may provide for it to be done if it be required, but in most cases it would not be advisable to do the work in that way.
8926. But would not that be in accordance with the specification? The specification requires the work to be done in that way supposing the engineer thinks it desirable to call upon the contractor to do it.
8927. Where is the conditional clause? I am aware of the existence of clause 95 upon page 286 of the Parliamentary papers, but I may say at once that it would not have been desirable to put that clause into operation, because in my judgment the work done in that way would not have been so good as it was, done in the way in which we did it. (*Vide Appendix No. 35.*)
8928. The clause to which you have referred, then, was never carried out? Not unless there were some particular case where it might be advisable to carry it out. Generally it would not be so.
8929. But it is mentioned that the concrete has to be put on in layers? Yes. A layer is put on the top of the layer already laid before it has time to set, and so the work proceeds.
8930. What would be the extent of a layer? Nine inches.
8931. Do you put a cement grouting between? No; there is no necessity for cement grouting, because the lower layer is green—in fact, it is quite wet—when the other layer is put on the top of it.
8932. What section would be done at a time? In a tunnel, I suppose, they would work right ahead, and do as much as could be done in a day—probably a chain and a half. It would depend upon circumstances. It might be more or less, according to the quantity of concrete that would have to go in.
8933. And do they commence with the second layer on the next day? No; the whole sewer is finished in one operation.
8934. But take the first layer of 9 inches—to what extent is it carried? Perhaps I had better explain how the work is done, and then you will know precisely what happens. Take a tunnel: After the excavation is finished the tunnel is thoroughly cleaned out, and what are known as pats—that is small blocks of concrete—are put along the centre. The levels and lines are given on the top of these concrete pats. Then the pats are allowed time to set, probably two or three days or more. The centering is then put in on the concrete blocks; and when the centering is put in the concrete is put round the centre. You could not put it in layers in the case of the tunnel. There are circumstances in which it would be advisable to have the work done in that way, but not in the case of a tunnel.
8935. But is it not the intention of the specification that the work should be done in that way in a tunnel? There is a general clause applying to the whole of the concrete work.
8936. Take clause 27? That has to do with the way in which the concrete has to be mixed, and not with the putting of it in position.
8937. But take clauses 93 to 97;—what do they indicate? They have to do with the way in which the concrete is put in position generally.
8938. Are all the clauses in the section dealing with concrete work adhered to? Where they apply; but we do not adhere to a clause simply because it is there. We make use of these clauses intelligently.
8939. And is the specification generally carried out? In its entirety.
8940. As far as concrete work is concerned? Yes.
8941. Take the proportions of 7 of metal, 3 of sand, and 2 of cement, and treat them as separate heaps;—will you let us know the total quantity that would proportion to one cask of cement? I may say at once that that is a most difficult question to decide.
8942. For instance, how much cement would there be in the 24 feet, taking the 7, 3, and 2 mixture? There would be four parts of Portland cement.
8943. That is a cask? Not necessarily.
8944. What is a cask? A cask is a cask.
8945. Is not 4 feet the standard measurement of a cask? No.
8946. Is it not the standard put in your specification? We say we will accept a cask for 4 feet, but that is not the measurement of a cask.
8947. Is it not what you put down in your conditions? We say that we will accept a cask of cement as equal to 4 cubic feet of cement.
8948. Is that not accepted as a standard quantity of a cask in all the selling and buying trades, in all the building trades in which cement is used? We accept it in connection with the sewerage contracts. In the case of the harbours and rivers I think the standard is  $4\frac{1}{2}$ ; in some cases it is  $4\frac{3}{4}$ . In the sewerage contracts we have kept to 4 cubic feet. It is an old measurement introduced years ago by Mr. Bagge.
8949. If  $4\frac{1}{2}$  feet were allowed to a cask, would that be a fair average measurement? That again would depend upon the fineness of the cement.
8950. That will not interfere with the bulk, will it? Yes; it will make all the difference. If you take fine cement out of a cask of German cement, and coarse English cement out of another cask, and then measure the two quantities of cement, you will find that you get more from the German cask than from the English cask.
8951. Still the bulk is the same in the cask? The bulk is compressed into the same space. Of course if you take it out of the cask it is another thing.
8952. But half a foot in 4 feet is a very fair margin to give? I would not say that it averages a half. It would depend upon the fineness of the cement.
8953. Would the average be less than  $4\frac{1}{2}$ ? The average would be more I should think, but I could not say positively. It depends entirely upon the fineness of the cement.
8954. Take the 4, 2, and 1, concrete—suppose you do not mix the quantities but take the bulk of each material, 4 feet of cement would go to 28 feet unmixed, would it not? Four parts of Portland cement would go to 8 parts of sand and 16 parts of bluestone metal.
8955. Then take the 5, 2, and 1 sandstone concrete—if you put the sandstone, the sand, and the cement side by side in that case 4 feet would go to 32 feet, would it not? The 4 feet would correspond with the 8 feet of sand and 20 feet of stone.

8956. Take the 4, 2, and 1—you say that taking the bulk of the material independently it comes to a certain total;—if you mix the materials of each lot together would not the 2 of sand and the 1 of cement disappear in the interstices of the stone in each of the cases? Certainly not.
8957. To a great extent it would do so, would it not? Most decidedly not.
8958. What fills up the interstices? The compo., of course. What you say is that they disappear, and I do not agree with you.
8959. If they fill up the interstices they must disappear? They disappear in so far as they are required to fill up the interstices of the stone, but not beyond that.
8960. The same thing would happen in the 5, 2, and 1 mixture, would it not? The sand and cement when mixed together would disappear in so far as they are required to fill up the interstices of the stone, but not beyond that.
8961. The same thing would apply to the other concrete? Necessarily so.
8962. This would, in the three cases, reduce the bulk considerably? I do not think it would do so considerably, but it would reduce the bulk.
8963. *His Honor.*] Do I understand that the concrete pats are so brought up that the level of the top of the invert is the level of the top of the pats? Yes; the level of the invert corresponds with the top of the pats. The centering is placed on the pats, and the sewer is constructed round the centering.
8964. What length of centering would be constructed at once before you begin to put in the concrete? In the case of a tunnel the centering has to be constructed at the same time as the sewer. In these small tunnels you have to breast the work forward.
8965. How far can you get back? Not more than 10 feet. The work is breasted forward in 10-ft. lengths. The men go midway between the shafts, and then build the sewer outwards towards the shafts.
8966. So that the concrete has to be forced between the centering and the wall of the tunnel? Between the centering and the sandstone rock.
8967. So that you could not put it on in layers? It would be impossible to do so in that position.
8968. *Mr. Parkes.*] Can you not work over the side of your centres? You can do so when you get to a certain height, but you cannot do so in the lower portion of the work.
8969. You do not put in your centering until you get some of the concrete fixed? It is put in on the top of the pats.
8970. *His Honor.*] You are referring now to cases where you are building a concrete invert with a brick arch on the top? Yes. The brick arch is another operation entirely. Generally the concrete is finished up to the springing level of the sewer between the two shafts. The bricklayers are then sent in, and start midway towards the shafts with the brick arching.
8971. The centering for the concrete is merely a half centering? Yes; it completes the work up to the level of the springing of the arch.
- 8972-3. How is the centering kept down? Stays are put across the tunnel, and the centering is bolted to the cross-pieces. In some cases, where necessary, there is a stay coming down from the roof, but of course where the cross-pieces are fixed in the rock of the tunnel the vertical pieces are unnecessary.

William Kenwood sworn and examined:—

8974. *Mr. Parkes.*] Do you know Mr. C. B. Bond? Yes.
8975. He is your father-in-law, I believe? Yes.
8976. Do you transact his business for him? No, I do not.
8977. Do you not generally advise him in his business? No. His business is that of a produce merchant.
8978. But he consults you in business matters? In certain business matters.
8979. Do you know Mr. John Carter, the contractor? Yes.
8980. Did Mr. Carter call upon you with reference to a contract at North Sydney known as 79 Contract? I remember his calling upon the firm of Kenwood & Co.
8981. What did he ask you to do;—what was his business with you in connection with that contract? He asked me, if I remember rightly, whether I thought Mr. Bond would withdraw his tender for a consideration. I remember telling him that that was a matter for Mr. Bond to determine, but if he thought Mr. Bond would do so, I would introduce him.
8982. On what date was that? I could not say, speaking from memory.
8983. The letter I now hand you is in your handwriting, is it not? No; it was written by my partner at that time, Mr. Kerle.
8984. The letter is dated 28th September, and the effect of it is to withdraw Mr. Bond's tender? It is addressed to the Secretary for Public Works.
8985. I suppose it was before that letter was written that Mr. Carter called upon you? Yes.
8986. Did you go with him to see Mr. Bond? I did.
8987. What did Mr. Carter say to Mr. Bond? Mr. Bond's interview with Mr. Carter was to a certain extent a private one, and as far as I can remember I did not hear all that passed. I was present, but I did not take cognisance of what was said further than that I knew what the business was about.
8988. Do you remember Mr. Bond asking Mr. Carter what guarantee he had that he would get Contract 79 before this other arrangement was arrived at? Mr. Bond certainly required some consideration from Mr. Carter on the ground that he was losing the contract. He wanted some consideration from Mr. Carter before he withdrew his tender.
8989. When was that consideration paid? At about that time, I think.
8990. Will you look at the promissory-note I now hand you;—have you seen it before? No.
8991. What date does it bear? 23rd March, 1892.
8992. This letter which you say Mr. Kerle wrote is dated 28th September, 1891? Yes.
8993. What guarantee then had Mr. Bond that he would receive the money which was agreed upon? No further guarantee than the bill, I take it.
8994. But the promissory-note was not made until March, 1892, whereas Mr. Bond withdrew his tender in September, 1891? I could not say anything further as to that than this,—that Mr. Carter is a reputable man, and, I presume, his bill would be considered good.
8995. But Mr. Bond did not get a bill then, he only got a promise to pay? Well, I take the promise to be the bill.

J. Davis.  
15 July, 1896.

W. Kenwood.  
15 July, 1896.

- W. Kenwood. 8996. The bill is dated March 23rd, 1892, and the contract is signed March 13th? Yes. I suppose that Mr. Bond took Mr. Carter in good faith. I remember his asking me who Carter & Co. were, and I said they were very reputable men, and that he could depend upon them. I have no doubt, therefore, that he took Mr. Carter in good faith.
- 15 July, 1896. 8997. But the date of Mr. Bond's letter withdrawing the tender is 28th September, 1891;—is it not? Yes.
8998. Was any bill executed at that time? No; not to my knowledge.
8999. Was Mr. Bond a man likely to enter into an arrangement to withdraw his tender without some guarantee from Carter and Co. that they would get Contract 79? Of course there must have been some guarantee, but I do not know whether it had reference to that contract.
9000. But the promissory-note comes in after the contract was signed;—what I want to know is what guarantee was given at the time the letter was written withdrawing the tender? I really do not know.
9001. Do you know whether Mr. Carter informed Mr. Bond that he had a promise that he would receive Contract 79? I do not know about that; but he certainly did not tell me so.
9002. Do you remember the conversation which took place at the interview to which you have referred? The conversation, as far as I can remember it, was this: there was a proposal by Mr. Carter to purchase Bond and Hudson's right to the contract, Mr. Bond undertaking to withdraw their tender.
9003. But when were they to be paid for doing that? That I could not say. That was a matter arranged between Mr. Bond and Mr. Carter himself. Mr. Bond subsequently saw me and asked me what I thought of the proposal and I remember pointing out to him that as he would have to find a very considerable quantity of plant for the job—plant of which he had none in stock—it was probably a very good opportunity for him to sell. Beyond that I do not know what arrangement was made.
9004. Was there any agreement drawn up at the time? An agreement was drawn up by Mr. Kerle between Mr. Carter and Mr. Bond.
9005. Could you produce it? I could not say. It was handed to Mr. Bond, I believe, and he has been out of business so many years that I question whether it could be found.
9006. *His Honor.*] Is Mr. Kerle in business now? Yes. I ought to explain that I was requested by Mr. Bond to watch his interest and to assist Mr. Hudson in making up their tenders. This matter being connected with one of their tenders, Mr. Bond asked me my opinion upon it. When Mr. Bond accepted Mr. Carter's terms I asked Mr. Kerle, as I thought it better for him to do it, to write out an agreement between Mr. Bond and Mr. Carter. That agreement I believe was written out, but whether it was destroyed among other papers in connection with Mr. Bond's business, or whether Mr. Bond kept it afterwards, I could not say. The agreement was written, and was witnessed by Mr. Kerle. The cheque which is produced was received by Mr. Kerle. I did not receive it.
9007. You are referring now to the cheque of £200 which was given to you by Mr. Carter? Yes.
9008. There is an indorsement of Kenwood and Kerle upon that cheque? Yes.
9009. Therefore it was paid into their account? Yes.
9010. Have you no recollection as to where the agreement between Mr. Bond and Mr. Carter was put? It is extremely probable, I think, that it has been destroyed. Mr. Kerle and I dissolved partnership fourteen or fifteen months ago, and Mr. Bond and Mr. Hudson have had no work together for the last three years. I imagine that a document of the kind to which you refer would not have been kept by Mr. Bond, even supposing it to have been sent down to him. I very much question whether it was. I think we may have kept the agreement ourselves. In that case it would be put with the papers in connection with Kerle and Kenwood's affairs. When we were shifting our offices I do not remember seeing it, but I can search for it if you wish it.
9011. Can you tell us the nature of the agreement—that is, what it contained? I do not remember ever reading it, but I know its nature. It was this—that for a certain consideration Mr. Bond should withdraw his tender.
9012. Will you make a search for the document and produce it if you can find it? Yes.
9013. After this transaction with Mr. Carter did you see Mr. Hickson at all? No; I never met Mr. Hickson at all in connection with any of these contracts.
9014. Did you see any officer of the Department? No.
9015. Had you any conversation with Mr. Hudson? Yes.
9016. You did not tell him anything about the matter, did you? Yes, to a certain extent, I told him. I believe he understood that the matter had been arranged. I think he had been previously told by Mr. Snodgrass. I remember his saying that Mr. Snodgrass had met him and had told him on two or three occasions that the job was not a good one for him, and had asked him what he was going to do in the matter. I think, therefore, that Mr. Hudson had some knowledge of the arrangement. I think he understood that matters had been arranged between Mr. Bond and Mr. Carter.
9017. Did he know that Mr. Bond had received £750 to withdraw the tender? That I could not say.
9018. You did not tell him that? No; I believe he knew there was to be some consideration, because there had been previous losses on contracts, and he must have known that this money went to reimburse him for losses. I think Mr. Hudson must have known that, but, of course, I cannot say to what extent his knowledge went.
9019. You did not tell him yourself that Mr. Bond had received the £750? No.
9020. *Mr. Gummow.*] Do you know of your own knowledge whether any cash passed between Mr. Bond and Mr. Carter? I could not say.
9021. With regard to the document which Mr. Kerle drew up—I mean the agreement between Mr. Bond and Mr. Carter;—when the payment was made, would not that document be useless as far as any further transactions were concerned? The promissory-note may be a renewed one for all I know; I do not know whether it is so or not.
9022. But if the money were paid in connection with the transaction, would not the promissory-note be worthless after the payment had been made? Certainly.
9023. I am assuming that it had been paid? Exactly.
9024. When Mr. Carter saw you with reference to this tender of Bond and Hudson's, did he not point out to you that you were rather low in your tendering? No; the first I heard of that was through Mr. Hudson. He said that he had seen Mr. Snodgrass and that Mr. Snodgrass had asked him what we were going to do.
9025. But you had heard that your tender was low, taking the schedule basis? No; I thought we had a fair price.

John Carter recalled and further examined :—

9026. *Mr. Parkes.*] When you made the arrangement with Mr. Bond, which has been referred to this morning, did you then give him a promissory note? No; I gave him a cheque.
9027. For what amount? £750.
9028. That was another £750, then? Yes.
9029. In all then you paid Mr. Bond £1,500? Yes.
9030. First you gave him a cheque for £750 and then a promissory note for £750? Yes.
9031. Did the cheque go through the account of Carter & Co.? Yes. I have some faint recollection of the agreement which has been referred to. To the best of my recollection it was torn up in Mr. Bond's presence.
9032. Was it after the promissory note had been paid that the document was torn up? Yes.
9033. *His Honor.*] I do not understand how it comes about that the promissory note bears this date—was that the date of the transaction? No; the transaction occurred towards the close of 1891. Your question refreshes my memory to some extent with reference to the agreement. There were only a few words in it. It was to the effect that we were to pay Mr. Bond £750 down, contract or no contract—I risked that £750—and that if the tender were accepted, a promissory note was to be given to him for the balance of the £750. I presume the tender would be accepted about that date—that is, the 23rd March—and that I then gave him the promissory note.
9034. *Mr. Parkes.*] The contract was signed on March 13th, was it not? Yes; you will see that that would allow me ten days for the transaction of this business with Mr. Bond. The cheque to Kenwood and Kerle was a payment for services rendered.
9035. Why did you not pay that in September instead of March? They were not entitled to it until the transaction was completed.
9036. It was not completed until the payment of the promissory note in June, 1892? I think that when I once gave the promissory note the transaction was settled.
9037. *His Honor.*] Then it cost you £1,700 to get the contract? Yes.
9038. You must have had great confidence in it? Yes, I had from the fact that we knew our business, and that I thought we should make a fair profit out of it. I also wished to employ two or three thousand pounds worth of air-blowing and other plant which was lying idle. We had about £3,000 worth of plant ready for the job, and we wanted to utilise it, and get some return for it.
9039. *Mr. Parkes.*] At that time you had completed all your contracts? No.
9040. You had a lot of plant lying idle? Yes. It was being released every day—hoisting engines, air-blowing plant, and things of that kind.

J. Carter.  
15 July, 1896.

George Edward Hudson recalled and further examined :—

9041. *Mr. Parkes.*] When you were here the other day, you stated that you had several interviews with officers in the Public Works Department? Yes. I do not know how many, but I was down there three or four times.
9042. Would that be after the commencement of the year 1892? I could not tell you the date at all. I know it was after we had tendered for the job, and before we got our money back.
9043. Do you recollect when the money was really got back? No; all that I know is that we got it back. I remember Mr. Bond telling me so.
9044. On what date did he tell you? I do not know, but the cheque would show the date.
9045. How long before you saw from the newspapers that the contract had been let to Carter, Gummow, & Co. was it that you had been calling at the Public Works Office? It must have been a couple of months.
9046. Did you know that Mr. Bond received £1,500 to withdraw your tender? No; I knew there was an arrangement of some sort or other, but what it was I did not know. I know that Mr. Carter saw Mr. Bond in reference to the matter. I remember Mr. Snodgrass seeing me and telling me that we should not make anything out of the job as we were so much below them. I thought he was merely endeavouring to frighten us from taking up the job.
9047. And that he was inducing you to relinquish it? Yes. They were the next tenderers, and I took it that if we let the job go they would have a show of getting it. I thought they were trying to get at Mr. Bond and myself.
9048. On Monday you said that you had never before heard of a letter of Mr. Bond's withdrawing your tender? No; I never heard it until you read it.
9049. Therefore you did not know that the contract had been withdrawn? No. I told Mr. Bond to write withdrawing the deposit, and I understood that that was what was done.
9050. You did not understand that he was to forfeit the contract? No; but he may have misunderstood me, and have written accordingly.
9051. If you were told that a former witness had informed us that he paid Mr. Bond £1,500 to withdraw your tender, would it surprise you? It does seem rather funny. I saw from the newspapers that Mr. Carter had paid £750.
9052. Did you ever hear of that before you saw it in the newspapers lately? No; I cannot say that I did.
9053. You had no knowledge of it? No.
9054. *His Honor.*] Did you not get anything? I have been contracting with Mr. Bond, and we have had several losses. I was in Mr. Bond's debt to the extent of some £700 or £800 at one time and another, resulting from losses on jobs. He held my name as security for that amount, and I should not wonder if this transaction had taken place, and he had taken the money in repayment of that debt. The old man is a gentleman, and he is honorable, and I trusted implicitly in him in whatever we did. I was satisfied that what he did would be for the benefit of the firm. I made inquiries yesterday concerning a matter, but I could not get any satisfaction from his son-in-law.
9055. You think he may have written a sum of money off your debt? It may be so. I have not had time since I gave evidence here the other day to find out the rights of the matter. I saw the statement in the *Sydney Morning Herald* of yesterday, and I came into town to interview Mr. Kenwood about the matter.
9056. *Mr. Parkes.*] Mr. Bond is very ill, is he not? Yes.

G. E. Hudson.  
15 July, 1896.

9057.

- G. E. Hudson. 9057. You know Mr. Kenwood very well, do you not? Yes; I have been acquainted with him ever since I have been acquainted with Mr. Bond.
- 15 July, 1896. 9058. You had to do contracting work with Mr. Kenwood? Yes; I had to submit all tenders to him so that he might check them. I put down the items and he checked them on behalf of Mr. Bond. He looked after Mr. Bond's interest in every shape and form.
9059. Did Mr. Kenwood ever mention to you the transaction which has been referred to this morning? All that I knew was that Mr. Carter had seen Mr. Bond. Mr. Snodgrass saw me as I told you, but he never offered me a shilling.
9060. Did he tell you that they could get the job if you were out of the way? No; but I knew they were the next tenderers, and that if we threw up the job it would probably fall to them.
9061. Has it not been your experience as a contractor that in such cases the work is re-tendered for? Not in all cases.
9062. Do you know of any case where that has not been done? I could not call them to mind at the present moment, but I know there are several cases where the contract has been given to the next tenderer.
9063. Where the next tenderer has been £3,000 over the amount of the lowest tender, do you know whether it has been done? I do not know that I do.
9064. What do you say would be the probable profit upon the work if you had gone on with your tender? To the best of my recollection I made it run out at £5,000.
9065. Is that the profit you expected to make? Yes; about £5,000. Mr. Kenwood went over the items with me. We had to do this in every instance to convince Mr. Bond.
9066. Only a few contractors tendered for this particular job? I do not know how many there were.
9067. It was a very big work? Yes.
9068. The only contractors were Bond and Hudson, Carter & Co., Gummow and Gillan, D. Sheehy, J. M'Sweeney, Lemme and Spencer, and J. Taylor & Co.? Yes. Carter & Co. and Gummow and Gillan were separate at that time. I reckon that seven tenderers for a big job like that is a fair competition. There are often only three when the job is a very big one. It is out of the reach of poor men, and they cannot afford to go for it. I myself have often been kept from tendering for big jobs.
9069. These big jobs you say keep small contractors from tendering? Yes.
9070. Do you recollect whether it was Mr. Mitchell and not Mr. Piper you saw concerning your tender? Mr. Piper is the only man I know by name. I went to him to get back our cheque when our tender was not accepted.
9071. Would you know the man if you saw him? No; I went to several at that time.
9072. Did you go to the clerk in the tender room—to the officer in charge of tenders? I cannot say, speaking from memory.
9073. He never informed you that Mr. Bond had withdrawn his tender altogether? No.
9074. What did he tell you? He said we could get back our money by applying for it.
9075. And that you could take your tender up at any time? He said that we could withdraw our money without prejudice.
9076. Without prejudice to your tender? Yes.
9077. Was there any probability to your mind of the job being gone on with? Long before that I asked when the Department were likely to go on with the job. I was continually coming down to know if the department were going on with it, and they said they were not likely to be going on with it for two years.
9078. Could you not recognise the officer you saw if he were brought here? No, I cannot say that I could.

George Christie recalled and further examined:—

- G. Christie. 9079. *Mr. Parkes.*] Since you were here on the last occasion, you have gone carefully through the whole of the transaction in connection with the letting of Contract 79? Yes.
- 15 July, 1896. 9080. In these Parliamentary papers there are a great number of papers having reference to Contract 72 missing, which have a concurrent effect so far as Contract 79 is concerned? Yes; there is a necessary connection between the two Contracts—72 and 79.
9081. And the material papers in connection with Contract 72, bearing upon the letting of Contract 79 to Messrs. Carter & Co. without re-tender, are omitted? None of them are included in the Parliamentary papers.
9082. Will you read, as part of your evidence, a memorandum showing the result of your investigation in this matter? Yes; it is as follows:—

MEMO. No. 4.

*Re* the incompleteness of the papers relating to Contract No. 72 (Shea's Creek) in the return furnished by the Department of Public Works to the Legislative Assembly, in compliance with an order dated 10th October, 1895:—

(a) The papers relating to Contract No. 72 appear in the return as printed at pages 135 to 162. Of these, only two pages are occupied with other matter than the Contract Bond and Annexures thereto. (*See* also Index to Printed Papers.)

(b) A perusal of the papers as printed would convey to the Legislative Assembly the following as the story of the contract:—

- (1) Tenders were invited in the usual way, and Messrs. Carter & Co.'s tender for £20,650 (on schedule rates) was the lowest received, and that tender was accepted.
- (2) The contract was signed on 16th March, 1891, and the time for completion was eight months.
- (3) An extension of time of four months from 18th April, 1892, was granted on 19th April, 1892.
- (4.) That the work was duly and satisfactorily completed without any dispute. And that the final certificate was granted for £25,264 19s. 4d.

(c) No information was conveyed to Parliament by the papers that the works had been stopped by the Department for the four months preceding the agreement dated 19th April, 1892, under which the extension of time was granted. Nor that the contractors had made a claim for £4,050 9s. 6d. Several important minutes as to the providing money to meet liabilities under the contract are omitted. The suit, *Macnamara v. Smith*, in connection with which £316 12s. 6d. was paid by the Government is not mentioned. The whole of the correspondence on these important matters, and the usual departmental matters, have been omitted.

(d) I have carefully examined the papers which were withheld from Parliament, which have now been obtained by the Commission. Dealing as they do with such important and special matters as are referred to in the above paragraph (c), there can be only the one conclusion, namely, that the papers were knowingly withheld.

(e) I append a schedule of certain of the papers which were omitted.

Sydney, 15th July, 1896.

GEO. CHRISTIE, F.S.A.A.  
SCHEDULE

SCHEDULE of Papers in connection with Contract 72 not included in Parliamentary Return, ordered 10th October, 1895.

G. Christie.  
15 July, 1896.

| Registration No. | Date.         | Writer.                                       | Subject.   |
|------------------|---------------|---|--|
| 91-2424          | 3 Oct., 1891  | J. Davis (minute) .....                       | Arranging votes available to finish contract.  |
| 91-2637          | 23 „ 1891     | E. A. Nardin (minute) .....                   | do do  |
| 91-2819          | 28 Nov., 1891 | J. Barling (minute) .....                     | do do  |
| .....            | 13 Oct., 1891 | R. R. P. Hickson (letter) to Carter & Co.     | Notifying intention to stop works at a certain point in accordance with clause 3 of the specification.                                       |
| 91-2824          | 21 Nov., 1891 | C. H. Ohlfsen - Baggé (minute).               | Commenting on local Council's communication complaining of stoppage of the Munni-street works.   |
| .....            | 5 Feb., 1892  | R. R. P. Hickson (minute)                     | Re cost of works, and votes.   |
| 92-324           | 15 „ 1892     | Carter & Co. (letter) to Engineer-in-Chief.   | Enclosing claim for £4,050 9s. 6d.   |
| 92-382           | 15 „ 1892     | J. Barling (minute) .....                     | Minute on letter from Council Clerk, M'Donaldtown.   |
| 92-387           | 23 „ 1892     | J. Barling (letter) .....                     | Letter to Mr. Abbott, M.P., re resumption of works.  |
| 92-409           | 27 „ 1892     | Carter & Co. (letter) to Engineer-in-Chief.   | Applying for refund of security deposit.   |
| 92-433           | 2 Mar., 1892  | J. Davis (minute) .....                       | Recommending that above request be granted.  |
| 92-490           | 5 „ 1892      | T. F. Waller .....                            | Report on M'Namara's claim.  |
| 92-644           | 25 „ 1892     | Carter & Co. (letter) .....                   | Asking that time penalties be remitted.  |
| .....            | .....         | J. Davis .....                                | Minute thereon.  |
| 92-771           | 5 April, 1892 | R. R. P. Hickson (minute) to Under Secretary. | Recommending that Contract 72 be proceeded with by Carter & Co.  |
| 92-912           | 28 „ 1892     | J. Davis (minute) .....                       | Recommending that the Department pay one-third cost of turning water out of sewer.   |
| 92-904           | 27 „ 1892     | Parry and Farley (letter) ..                  | Offering to do same on above condition.  |
| 92-2000          | 8 Sept., 1892 | J. Davis (minute) .....                       | Recommending repair of rendering in invert of sewer.   |
| 92-2405          | 1 Nov., 1892  | Carter & Co. (letter) .....                   | Offering eleven gratings at 50s. each.   |
| .....            | 8 „ 1892      | R. R. P. Hickson (letter) to Carter & Co.     | Willing to accept same at 45s. each.   |
| 92-2456          | 12 „ 1892     | Carter & Co. (letter) to J. Davis.            | Asking for remission of time penalties (£100).   |
| 92-2459          | 14 „ 1892     | J. Davis (minute) .....                       | Recommending remission of same.  |
| 93-4             | 31 Dec., 1892 | S. H. Weedon, Resident Engineer (minute).     | Report in connection with final certificate.   |
| 95-273           | 5 Mar., 1895  | W. Piper (memo.) .....                        | Informing Mr. Hungerford that the £316 12s. 6d., re M'Namara v. Smith, had been charged to "Reclamation and dredging, Loan Act, '94, No. 2." |

9083. You have read the minutes relating to Contract 79, upon pages 270 and 271 of the printed Parliamentary papers? Yes.

9084. You will see that the minutes go up to 22nd February, 1892, when the contract was supposed to be gazetted for re-tendering? Yes.

9085. Upon the following day, Mr. Hickson wrote a minute to the effect that Carter & Co. had a claim in connection with Contract 72, which they were willing to forego if they obtained Contract 79? Yes.

9086. Will you read the result of the investigations you have made as to the position in which that claim stood, and as to its validity? Yes; they are as follows:—

## MEMO. No. 5.

Re the letting to Carter & Co., Contract No. 79 (North Shore) without re-tendering.

(a) Tenders for Contract No. 79 were originally invited for, and received on, 10th June, 1891. The lowest tender was that of Messrs. Bond and Hudson, £36,900 (on schedule prices). The next lowest was Carter & Co's., at £39,890.

The Tender Board recommended the acceptance of Messrs. Bond and Hudson's tender.

(b) The papers show that Messrs. Carter & Co. and Messrs. Gummow and Gillan jointly signed a letter dated 10th June, 1891, protesting against the contract being given to Messrs. Bond and Hudson. But as the ground for objection was not sufficient, and of so old a date, the recommendation of the acceptance of Messrs. Bond and Hudson's tender was not withdrawn.

(c) From the evidence that has been taken by the Commission in this matter, Mr. Bond was to finance and attend to the financial part of the undertaking on certain terms agreed to by Mr. Hudson. Mr. Hudson was possessed of the practical experience for carrying on the works, but was not a business man or accustomed to office matters, correspondence, &c.

(d) Though the Tender Board had recommended that Messrs. Bond and Hudson's tender be accepted, no acceptance was ever notified to that firm.

The matter was submitted for the Minister's decision on 13th July, 1891, and again on 19th August, 1891, and the Minister, on 21st August, 1891, made a minute as follows:—"Inform must stand over until the question of further loan expenditure has been determined." And there is a minute—"Ordered to stand over.—J.B., 7/9/91." Following the date of this last minute comes the letter of Mr. C. B. Bond (Bond and Hudson), dated 28th September, withdrawing the tender and asking for a return of the deposit (£369). The minute on this letter is—"Return deposit.—J.B., 2/10/91." But there is no evidence of Ministerial sanction.

In the précis of the case dated 29th January, 1892, it is stated that the £369 tender deposit was returned to Mr. Bond on 7th October, 1891.

(e) One day prior to the date of the deposit being returned, namely, on 6th October, 1891, Mr. Hickson asked for the papers, and wrote a minute recommending that fresh tenders be invited. This recommendation is marked "Submitted, J.B., 9/10/91." But owing, it would seem, to changes in the Ministerial head of the Department, Mr. Hickson's minute of 6th October, 1891, was not dealt with until "Approved, W.J.L., 22/2/92." Then advertisements calling for tenders was ordered to be inserted in the *Government Gazette*, tenders to close 9th March, 1892.

(f) But on 23rd February, 1892, Mr. Hickson wrote a minute recalling his recommendation for fresh tenders, and recommended that Messrs. Carter & Co. be given the contract without any further competition. The reasons stated by Mr. Hickson are set out in his minute at page 271, as follows:—"Since writing my minute of 6th October, 1891, complications have arisen with Carter & Co., re their Contract No. 72 having been stopped. They have made large claims on this account, some of which, no doubt, could not be entertained, but on some items they have made a good case. They are prepared, if they obtained this work, to waive all claims on No. 72. As their tender is a reasonable one, and some £3,600 below the estimate, I think it might fairly be accepted. If this course were adopted, work would be given at once to a large number of men.—R.H., 23/2/92. Under Secretary. Important."

Mr. Hickson's minute is marked to the Under Secretary, and the Minister's minute, dated 23rd February, 1892, is as follows:—"As Mr. Hickson thinks Messrs. Carter & Co. could make good a claim for something like £2,000 as compensation on Contract 72 (Moni-street, partly), should they be willing to forego this claim, their tender may be accepted for construction of the main outfall sewer, North Sydney—£39,890, as worked out at schedule rates. If this firm will not agree to the condition imposed, fresh tenders to be invited.—W.J.L., 23/2/92.

(g)

G. Christie.  
15 July, 1896.

(g) The negotiations with Messrs. Carter & Co. appear to have been completed on 10th March, 1892, as on that date their tender, dated 10th June, 1891, was accepted (after an interval of nine months). Had the decision of 22nd February, 1892, to call for fresh tenders for 9th March, 1892, been adhered to, the fresh tenders would have been dealt with without any more delay than thus did actually occur.

(h) As the "claim" made by Messrs. Carter & Co. in connection with Contract No. 72, the withdrawal of which was made the condition of their being given Contract No. 79 without re-tendering—this claim first appears in a definite form on 15th February, 1892, eight days prior to Mr. Hickson's Minute of 23rd February, 1892, on which the re-tendering was stopped. The claim amounted to £4,050 9s. 6d., and was stated to be for loss consequent upon the stoppage of the contract works at a certain point, and is as follows:—

Copy of Carter & Co.'s Claim in re Contract No. 72.  
Losses by Withdrawal of Contract Work.

|  |                   | Rate. | £     | s. | d. |   |

| Loss of Profit on work withdrawn ...                     | £7,000 .....      | 25 %  | 1,750 | 0  | 0  | The greatest profit would have accrued from this portion of the Contract. |
|  |                   |       | 4,050 | 9  | 6  |   |

(i) By letter dated 13/10/91, Mr. Hickson notified Messrs. Carter & Co. that they were not to proceed with the works on Contract 72 beyond a certain distance, and stopped the works from that point in accordance with Clause 3 of the specification. This Clause 3 reads as follows:—

3. It is to be understood that the lower 13 or 27 chains of the channel shall not be constructed until the Engineer gives a written order to that effect; and the Engineer shall have the power to suspend the execution of these portions of the work, or any part of the contract, or to reduce the length of the contract by the extent of the said 13 or 27 chains, or any other part of the sewer shown on the drawings that he may consider necessary, and the contract shall not thereby be invalidated, nor shall the contractor be entitled to any compensation on account of such temporary suspension of any part or parts of the contract or permanent reduction of same.

This clause was specially inserted to allow of the works being stopped at a certain point, on account of the money not being available to carry on the further construction, consequent on the cost of the whole of the works exceeding the Vote.

Messrs. Carter & Co. tendered on this specification with a full knowledge of its contents, and furthermore they had had an extra piece of work to the extent of £ , which had not been originally included in the contract.

(j) The contractors had early notice of the Department's intention to stop the works at a certain point. And it is difficult to conceive, in view of the special clause, No. 3, of the specification, how their claim for £4,050 could ever have been in any way seriously entertained by the officers of the Department, particularly as those officers knew that the work was only temporarily suspended, and that it was their intention to proceed with the work so soon as money was available.

(k) But the matter becomes a very serious one if at the time the Minister on the recommendation of his officers gave Messrs. Carter & Co. an advantage in securing contract 79 without further competition, believing that by so doing he was settling a claim and saving a payment on contract No. 72 of some £2,000—if at that time the officers were aware that the work on contract 72 would soon be proceeded with, and that consequently Messrs. Carter & Co. could not then have even an excuse for a claim.

The Minister's minute is dated 23/2/92, but it is not final, and, in fact, the negotiations were proceeding till 10/3/92, the date when the acceptance of Messrs. Carter & Co.'s tender was notified to them by letter.

There is evidence that on 23/2/92, and on subsequent dates up to 10/3/92, those officers were satisfied in their own minds that the remainder of the works comprised in Contract 72 would shortly be proceeded with. This is shown by the Minutes on the following papers:—

92-387. Minute on letter from Mr. J. Abbott, M.P., who was urging, on behalf of his electorate at Macdonaldtown, that the work be proceeded with. The Minute refers to Mr. Barling's reply 23/2/92, which is as follows:—"Dear Mr. Abbott,—The sum required to finish the Munni-street Storm-water Sewer will be placed on the Estimates, but Mr. Lyne desires me to say that he will not be able to deal with the matter until they are passed, which will, however, now I presume, be now in a short time. Yours, with kind regards.—J. BARLING."

92-382. Minute on letter from the Council Clerk at Macdonaldtown, who asks that the Minister might receive a deputation relative to the stoppage of the construction of the Storm-water Sewer, Munni-street. The Minute is initialled J.B., 25/2/92, and is as follows:—"May perhaps be informed that there is no need for a deputation, and that as soon as the additional money required is voted the work will be proceeded with."

Further, seeing that the "Loan Act, 1892, 55 Vic., No. 35," which contained the required item of £9,000 for Contract 72 (see item "Sewerage Branch—Munni-street to Shea's Creek, storm-water channel, further sum, £9,000"), passed the Legislative Assembly on the 24th March, 1892, the officers of the Department must have been aware on the 23rd February, 1892, and subsequent dates prior to 10th March, 1892, that the work on Contract No. 72 would very shortly be resumed. As a matter of fact, Mr. Hickson's minute, 5th April, 1892, recommended that the work on Contract No. 72 be resumed by Messrs. Carter & Co.

(l) Messrs. Carter & Co.'s claim is dated 15th February, 1892, and was marked by Mr. Hickson to Mr. Bagge for report on 18th February, 1892. Mr. Bagge sent it to Mr. Davis for report on 22nd February, 1892. Mr. Davis returned the papers on 26th February, 1892, with the following minute:—

"This matter has now been settled. I understand the contractors have signed the office measurements accepting them."

It would thus appear that on 22nd February, 1892 (when Mr. Hickson advised the Minister that he thought Messrs. Carter & Co. could make good a claim for something like £2,000 as compensation on Contract 72), that the documents were not with Mr. Hickson, and that the claim had not been looked into or reported on, nor has it at any subsequent date so been dealt with.

(m) It has been stated in evidence before the Commission that Mr. Bond, without Mr. Hudson's knowledge, withdrew the tender of Bond and Hudson; that Mr. Bond received £1,500 for so doing, and that Mr. Kenwood (Mr. Bond's son-in-law) was paid £200 for negotiating the matter.  
Sydney, 15th July, 1896.

GEO. CHRISTIE, F.S.A.A.

9087. *Mr. Parkes.*] Upon what date were the last payments made after Contract 72 had been stopped by the minute of Mr. Hickson? The certificate, I see, is dated 20th January, 1892.

9088. And Contract 79 was let in March? Yes.

9089. You have in paragraph I of your memorandum referred to clause 3 in the specification of Contract 72—that is a special clause, is it not? Yes.

9090. To meet this special case? Yes.

9091.

9091. Will you read the letter of Mr. Hickson withdrawing the work from Carter & Co. for a time—the letter dated 13th October, 1891? Yes. It is as follows:—

Gentlemen,

With reference to your contract, No. 72, Sydney Sewerage Works, Munni-street, Shea's Creek, south-west channel, I have the honor to inform you that, in accordance with clause No. 3 of the specification, which gives me power to make such permanent alterations as may be considered necessary, I have decided to terminate the contract after the construction of the junction chamber and connection with the Macdonaldtown Park storm-water channel at 41.30 chains, thereby omitting that portion of the contract from such junction upwards to the point of termination of the sewer, as shown on drawings at Union-street, and hereby give you notice that the Munni-street storm-water channel is not to be carried on beyond the before-mentioned junction.

That is a copy of Mr. Hickson's letter.

9092. Will you read Mr. Hickson's minute of 5th February, 1892? Yes. It is minuted to the Under Secretary, and is as follows:—

TENDERS were opened in February, 1891, for sewer from B to E, the lowest being that of Messrs. Carter & Co. for £20,650 at per schedule rates. This tender was accepted on the understanding that the cost of the work be reduced so as to bring the cost of the work within the amount allowed without reference to the Public Works Committee. At the commencement of the contract the sum of £15,500 was available, and this was proposed to be expended on the work between the Mitchell Road and Munni-street (C to E on sketch), a clause allowing a reduction of the work, A to C, being inserted in the specification. On starting the work, however, it was found that there was no outlet to the sewer at Mitchell Road, at C, and a channel had to be cut along the proposed course of Shea's Creek canal, A to B, at a cost of £4,000, to provide an outlet, and the sewer continued from Mitchell Road (C) to the commencement of the outlet channel (B), at a cost of £8,000. This unavoidable construction of the sewer in the first instance from A to D exhausted the funds, and that portion of the work from the Macdonaldtown Park junction, at D, to the point of commencement at Munni-street (E), which formed part of the original contract, has had to be omitted for the present.

9093. The date of the last certificate paid after the stoppage of the work was 20th January, 1892? Yes; and it was passed on 3rd March.

9094. What was the vote available? From particulars which Mr. Hungerford has given me I gather that it was £15,500.

9095. What was the total amount given upon the certificate? The total amount of payments to the date I have mentioned was £17,674.

9096. That exceeds the vote? Yes.

9097. Will you explain where the money came from which was not in that vote? The amount paid to the contractors out of the vote of £15,500 is set down as £14,968 18s. 6d., the balance of the £15,500 having been expended on payments for supervision, so that the vote was exhausted after payment to the contractors of the amount I have named. The further money was drawn from the Macdonaldtown Park sewer vote of £8,500. The sum of £2,465 is set down as having been drawn.

9098. Therefore the contract was really proceeding? Well, money had been found to proceed with it beyond the vote of £15,500. I think that a portion of this money may legitimately have been charged to the other vote. Extra work was done by the contractors which was not in the original contract, and it may be that some of it was chargeable to the Macdonaldtown Park sewer vote of £8,500.

9099. Will you read the minute of Mr. Hickson under date of April 5th, 1892, ordering the work to be proceeded with? Yes. It is as follows:—

Now that the necessary funds (£9,000) are voted for this work, I should be glad to have authority to continue the sewer which was stopped some months ago for lack of funds. The contractors have kept some of their plant and a lot of material on the ground. There is nothing, therefore, to prevent the work, which is much needed, being gone on with at once, and thus provide employment for a considerable number of men.

9100. What was the date of the signing of Contract 79? 10th March, 1892.

9101. And the minute ordering the work to be proceeded with in the case of Contract 72 is dated 5th April, immediately upon the passing of the Loan Act? Yes, that was passed on April 1st.

9102. Touching the claim of the contractors in respect to the stoppage of Contract 72, there is an item of 3,300 casks of cement. I believe you saw the sum totals worked out by Mr. M'Creddie and Mr. Thompson as to the cement used after the contract was restarted? I could not give evidence as to that. I was here yesterday, and heard a certain quantity mentioned. I have not seen their reports.

9103. Will you look at the 9th progress-return in connection with Contract 72 and tell me the quantity of sandstone concrete and cement facing paid for at that date? Item No. 5, sandstone concrete, gives 6,015 cubic yards as having been paid for, and item No. 6, cement facing; gives 8,175 square yards as having been paid for.

9104. Will you look at the final certificate in the printed Parliamentary papers and tell me what quantities were ultimately paid for? 8,372 cubic yards of sandstone concrete, and 12,324 square yards of cement facing.

9105. There being a difference of what between the two payments? In the case of the sandstone concrete a difference of 2,357 cubic yards, and in the case of the cement facing a difference of 4,149 square yards.

9106. Which would absorb a great quantity of cement? I could not say what quantity.

9107. Have you prepared a memorandum as to the quantity of cement to be used upon the contract according to the specification and the quantity which was actually purchased? I have not the memorandum complete yet, but I will complete it.

9108. Have you prepared a memorandum as to the nature of this claim in connection with Contract 72? I have not prepared a memorandum, but I have examined the claim carefully, and am in a position to answer any questions in reference to it.

9109. Do you think there really is any claim in connection with Contract 72? You mean, I suppose, from the legal aspect under clause 3?

9110. Yes? In the first place, under clause 3 no claim could arise.

9111. As regards the various items given to sustain the claim, are any of them tenable? Some of the items are small.

9112. Are there any of them which could be made good, regarding them in the light of your experience as a business man? Taking clause 3 strictly I should say that none of them at all had been sustained.

9113. *Mr. Smith.*] Do I understand you to say that you have read carefully not only the papers which were not printed, but also those which were printed? I have perused them carefully. I have gone specially into them.

9114. As regards your first memorandum, you say that it is the result of careful perusal? Yes.

G. Christie. 9115. With regard to paragraph C of that memorandum, do you say that it is absolutely correct? I have every reason to believe so.

15 July, 1896. 9116. You have come to the conclusion that some of these papers were wilfully and knowingly withheld? Yes.

9117. When you drew up that memorandum, did you know that Mr. Barling, the Under Secretary for Public Works, at that time had sworn here that he gave instructions that all the papers should be printed? No.

9118. Did you know that Mr. Hungerford, the officer charged with the preparation of the papers for Parliament, had also given evidence to the same effect, and that both of them had denied that any of the papers had been knowingly withheld? I am not sure that I knew that from the evidence or from the assertion of Mr. Hungerford.

9119. Do you know that he gave that evidence? I cannot say that I knew that any evidence had been given to that effect; but, even if it were, that would not affect my opinion.

9120. I suppose that, if certain papers were not asked for by the House, you would think that a sufficient reason for not including them in the printed papers which were laid upon the Table? I think that in this case the order was generally for all papers in connection with these contracts. The order was in these terms:—

Copies of all papers and correspondence in connection with the contracts of Messrs. Carter, Gummow, & Co., at Marrickville, Balmain, North Sydney, Johnstone's Creek, and Stanmore, including the specification, schedule, &c., for original contracts, and for substituted ones, and all vouchers paid and details of same, and such other matter included in the transactions, from commencement to the present date.

9121. Is there one word in that order referring to papers of Contract 72? The order does not mention 72, nor give the number of any contract, but it mentions the Marrickville contract, and it is possible that the papers in connection with Contract 72 may come in under that heading. But the important point is this, that, whether they do or do not come in under the heading of the Marrickville contract, they do come in at North Shore. It is in that respect that the papers are deficient.

9122. But the order of the House makes no reference to the papers? Yes.

9123. In what way? It says, "and such other matter included in the transactions from the commencement to the present date." That being so, I say that the papers in connection with Contract 72 come in under the heading of the North Shore Contract, 79.

9124. You think it would not be a fair conclusion to arrive at, upon the reading of that order, that the papers relating to Contract 72 should be omitted altogether? I think the papers are necessary in connection with Contract 79 at North Shore, and that contract is referred to in the order. All the papers relating in any way to that contract should be given.

9125. Now that your attention has been specifically drawn to the terms of the order, do you still adhere to your conclusion that these particular papers were wilfully withheld? Yes, and the Department evidently considered that the papers relating to Contract 72 should have been included, by themselves putting in some of those papers. They should have put in the whole of the papers relating to Contract 72, but they have left out very important matters in connection with that contract. The papers purport to include the papers relating to Contract 72, but they do not do so, and to that extent they are misleading.

9126. Clause (c) of the first memorandum you read to day contains these words: "No information was conveyed to Parliament by the papers that the works had been stopped by the Department for the four months preceding the agreement dated 19th April, 1892, under which the extension of time was granted";—is that true? Yes.

9127. Would it not appear from a minute, which you will see on page 271 of the Parliamentary papers, that Parliament was informed that the work had been stopped? There is that slight indication.

9128. So that it would be incorrect to say that no information had been given to Parliament on the point? There is that slight indication of information embedded in a minute.

9129. Is there not a special reference to it on the minute on page 271? Yes; it is embedded in a minute.

9130. Will you read the second clause of that paragraph? Yes. I see it states that the contractors have made claims.

9131. And you still say that in these papers there is no information that the contractors had made a claim for this sum of £4,050? I had not seen that.

9132. Have you read an agreement of the 10th March, printed in the Parliamentary papers upon page 272? I have not read it in this connection.

9133. You will observe, first of all, as to the parties, that it is an agreement made between John Carter, David Snodgrass, and George Forrest? My memorandum has reference to the papers of Contract 72, not to the papers of Contract 79.

9134. But you say that the Parliamentary papers convey no information that this claim had been made? I said the printed papers in connection with Contract 72 did not convey the information. That is where the papers bearing upon the matter should have been.

9135. But is there not upon page 272 a recital of the fact that these contractors had made a claim for the sum of £4,050? I am dealing with the papers of Contract 72, and this reference is embedded in an agreement in the papers of Contract 79. There is some reference to the matter in this agreement, but there are no other subordinate papers, as there should have been, leading up to it. I wish it to be distinctly understood that my memorandum deals specifically with the papers of Contract 72, and, if the Department professed to include all the papers in connection with that contract in this return, then the whole of the papers should have been included.

9136. Let me refer you to page 278—you will find there a letter in which Carter & Co. agreed to forego all claims to compensation in connection with Contract 73;—that is not embedded in anything; it stands out by itself? Yes, but it might refer to general things, whereas I am dealing with Contract 72; and I say that all the papers in connection with that contract should have been included in this return—in the few papers which are given in connection with it. Either the whole of the papers should have been given, or none at all. Anyone reading that letter would say that it related to general matters; no specific amount is mentioned.

9137. Does it not strike you that the printing of the contract of 72 and the final voucher of 72, although no papers in connection with that contract were asked for, was simply because of this recital bearing upon Contract 79? No.

G. Christie.  
15 July, 1896.

9138. You do not think that would be a valid reason? No, because the Department have, in the case of other contracts, given voluminous papers upon all matters of detail, and in this case, where there is really something important, those matters are omitted.
9139. I think your evidence, as to the claim made by Carter & Co. in respect of the stoppage of Contract 72, was that the claim was not legally sustainable? Clearly that is my opinion.
9140. Does that opinion refer to the whole of the items? I think to everyone of them.
9141. And you think that, although the work was stopped in the way indicated, the contractors have no claim to compensation at all? Yes.
9142. *Mr. Gummow.*] You referred in your evidence to a voucher dated 20th January, 1892, in connection with Contract 72? Yes, to a certificate of that date.
9143. Did you notice the prior certificate? Yes; the 8th progress return.
9144. What is the date? It is a return of work to the 30th November. A comparison of these vouchers did receive my attention at the time.
9145. Why did you not refer to it in your memorandum? The position of matters is this—there is a considerable advance in the amount allowed to the contractors upon the January certificate as compared with the amount allowed in November. I had the figures of the two vouchers side by side.
9146. What is the quantity allowed for sandstone concrete in the November certificate, and the quantity in the January certificate? I have not dealt with quantities, but only with amounts. My object was to see whether it was apparent that any more work had been done between the 30th November and 20th January. My deduction from the amounts shown upon each certificate is that work must have been done.
9147. Will you read out the amounts? Yes; I find that the amount upon item No. 5, sandstone concrete, in the 8th progress return, is £10,213 12s., as against £10,226 14s. 6d. in the 9th progress return. In the case of cement facing the amount given in the 8th progress return is £638 12s. 6d., and in the 9th progress return £1,021 17s. 6d.—a difference of £370 on that one item.
9148. Will you give me the quantities? Yes; in the 8th progress return the quantity of sandstone concrete is 6,008 cubic yards, and in the case of the 9th progress return 6,015 cubic yards—a difference of 15 yards. The cement facing upon the 8th certificate is given as 5,109 square yards, and in the 9th certificate 8,175 square yards—a difference of 3,066 square yards. It would seem from that item of cement facing that there must have been a considerable addition to the works certified for in the 9th progress return as compared with the 8th progress return.
9149. In other words the January certificate was a general cleaning up of work which had been done up to November, 1891? I do not think you could say there was a general cleaning up as regards cement facing.
- 9149½. Are you sure it was not so? I am only going from the figures upon which the previous payment was made—5,109 square yards. You will see that there is an addition of 3,066 square yards—an addition of 80 per cent.
9150. But take the concrete;—was any concrete work done? I should think not. The second quantity would be a more exact measurement probably.
9151. Have you any idea as to how much cement it would take to do 3,000 square yards of rendering? I am not dealing with that aspect of the question.
9152. Upon the question of cement the Department, according to your evidence, gave Carter & Co. notice in October, 1891, that this job at 72 contract would be stopped? That is the date of the written notice.
9153. Do you consider that Carter & Co. could have stopped their orders for cement as soon as they received this notice from the Government;—could they have stopped their orders on receipt of that notice? The position is this—Carter & Co. had a certain specification with the Department, and it was their duty to look ahead and see whether they would have to go on with the work or not.
9154. Suppose Carter & Co. had a contract with certain merchants for the supply of 5,000 or 10,000 casks of cement, could they suddenly abrogate that contract and stop the supply? Cement is always saleable at 6d. per cask reduction.
9155. Are you sure of that? Yes.
9156. Does not the price of cement vary in different months? Yes; but if 6d. per cask is taken off you can always sell a thousand casks of cement.
9157. You mean off the price at that particular time? Yes.
9158. Does not the price of cement vary very suddenly sometimes? No. There are advices from London, and cement merchants know how the market is going. They know the shipments to arrive, and there is no unlooked-for change in the price.
9159. If there is no cement in the market does not the price vary very suddenly? Yes, it may do sometimes.
9160. But does not that often occur? No.
9161. Has it not affected other contractors according to your previous evidence? That was tested cement. There would be plenty of other cement in the market.
9162. *Mr. Parkes.*] Mr. Smith asked you with reference to an agreement which appears in the papers for the carrying out of the second section of Contract 72, whether mention was not made in the papers of the claim of the contractors? Yes.
9163. Does not the presence of that agreement in the papers afford a strong reason for the inclusion of the other papers bearing upon Contract 72? Yes, it would seem to do so.

William John Lyne sworn and examined:—

9164. *Mr. Parkes.*] Do you recollect the date upon which you became Secretary for Works in the last administration of Sir George Dibbs? In October, 1891, I think, but I am not sure. The Blue Book will tell you.

9165. Do you recollect Contract 79, one of the North Sydney Sewerage contracts, being let to Carter & Co.? I do not recognise the contract by the number, but I know as a matter of fact that Carter & Co. had a contract at North Sydney.

W. J. Lyne.  
15 July, 1896.

W. J. Lyne. 9166. To refresh your memory, I will read to you a minute which you made at that time:—

15 July, 1896. "As Mr. Hickson thinks Messrs. Carter & Co. could make good a claim for something like £2,000 as compensation on Contract 72 (Mori-street, partly), should they be willing to forego this claim, their tender may be accepted for construction of the main outfall sewer, North Sydney—£39,890, as worked out at schedule rates. If this firm will not agree to the condition imposed, fresh tenders to be invited.—W.J.L., 23/2/92."

Do you remember that? Yes.

9167. Had you any conversation with Mr. Hickson before writing that minute? I think the chances are that I had.

9168. Do you recollect the occurrence? I do not remember any special conversation at that time, but upon an occasion of that sort I certainly should have had a conversation with Mr. Hickson before I dealt with the matter.

9169. Did you know at that time that a claim was being made by the contractors in respect of a contract which was started a month and eight days afterwards? I do not remember the circumstances at the present time.

9170. Do you recollect Contract 72 being re-started? I do not recollect it by the number. In any case, it is so long ago that I am afraid that I should not have a distinct recollection of what took place. I do remember writing the minute which you have read, and I remember that that amount of £2,000 was a consideration with me in determining whether the other contracts should be proceeded with by this firm. I wished to avoid any litigation or trouble.

9171. Did Mr. Hickson tell you at that time that in Contract 72 a special clause had been inserted to this effect:—

"It is to be understood that the lower 13 or 27 chains of the channel shall not be constructed until the engineer gives a written order to that effect; and the engineer shall have the power to suspend the execution of these portions of the work, or any other part of the contract, or to reduce the length of the contract by the extent of the said 13 or 27 chains, or any other part of the sewer shown on the drawings, that he may consider necessary, and the contract shall not thereby be invalidated, nor shall the contractor be entitled to any compensation on account of such temporary suspension of any part or parts of the contract or permanent reduction of same."

It is impossible for me to say now. I do not recollect the circumstance.

9172. If your attention had been directed to such a clause would you have sanctioned the letting of 79 to Carter & Co.? It depends entirely upon the circumstances. There may have been reasons why I should have done so. For instance, I may have been actuated by a desire to avoid litigation.

9173. The part of the specification which I have been quoting refers to the extent of the contract, and this special clause was put in to admit of a portion of the contract being deducted to meet the Loan Vote of £15,500? I do not understand how the contract could have anything to do with the meeting of a Loan Vote.

9174. Suppose we say the absorption of a Loan Vote—let me put it in that way? You mean to prevent the Loan Vote from being exceeded?

9175. Yes. Contract No. 72 was let at some £5,000 above the money available under the Loan Vote? Yes, I understand that.

9176. And in order to provide for that this special clause was inserted. If you had known of the existence of that clause would you have admitted the claim of the contractors? It depends entirely upon the circumstances. I do not remember at this moment whether their claim of £2,000 was made through the stoppage of the contract, under that or some other condition.

9177. Does not the condition I have read cover any stoppage of the contract? I thought you said the clause was put in to prevent the Loan Vote from being exceeded.

9178. Quite so. But if it had been brought under your attention and you knew that as soon as funds were available in the next vote this contract would be proceeded with, would you have admitted the claim of the contractors? I certainly would not have admitted it if that were the only reason,—that is, to prevent the Loan Vote from being exceeded.

9179. Take the various items constituting the claim—rent of Knight's paddock, £10; sandstone, for concrete, £400; Portland cement, £958; loss on sale of cement, £250; gratings, £87 10s.; man-hole covers, £30; interest on expenditure, £64; valuation of plant on grounds, £500; loss of profit on work withdrawn, £1,750—making a total of £4,050. If that contract were to be proceeded with do you think that any of these items would have been sustainable? I could not possibly say at the present time.

9180. Was this claim put before you? The chances are that it was. I should imagine that I obtained particulars of the claim. At all events I must have been satisfied that Mr. Hickson had had particulars of the claim before him, and I think it is very likely that the particulars were before me.

9181. If the contract were to be resumed within a month and eight days, there is no doubt that this claim would disappear? That I do not know. I do not know what Mr. Carter would have done, whether he would have absorbed all the material on the ground or not. I do not know whether the claim was absolutely for material which was to have been put into the contract, but which through its stoppage for the reason you have mentioned was not put into it.

9182. Have you any clear recollection of what took place at that time? Not in reference to that part of the matter.

9183. In all these matters, did you depend absolutely upon your officers? To a very large extent. There may have been certain circumstances of which I was aware myself, and, if in such a case I felt that I was justified in deviating at all from the recommendation of my officers, I should do so unhesitatingly; but in the majority of cases—in fact, in nearly every case, and especially where large contracts were concerned—I depended upon my officers, and especially upon Mr. Hickson.

9184. Is it not the custom in the Works Department, when there is a good margin between the lowest and the next tenderer, and when the lowest tenderer throws up the contract, to call for tenders again? No.

9185. Are there any instances to the contrary? There are some instances, but the matter generally goes before the Board of Reference, and the Board would give reasons for calling or not calling for fresh tenders.

9186. Would it not leave an opportunity for fraud to be perpetrated upon the State by one contractor purchasing off another? If anything of that kind came to the knowledge of the Board, or myself, of course the next tender would not have been accepted; but, if it were a *bona fide* case where a man might have miscalculated his amounts, then you would have a different state of things. In some cases the tenderers not only in sewerage but in road works do miscalculate their amounts. In numerous cases of road

- road and bridge contracts it has been clearly shown that the tenderers miscalculated their items, and under those circumstances it would not have been a fair thing to compel them to carry out the work.
9187. Would it not be a fair thing under such circumstances where a contractor had thrown up the contract to call for fresh tenders? Not if there were special reasons to the contrary. Suppose the departmental estimate were lower than the tender of the next contractor, that might be a reason for calling for fresh tenders, but, if the departmental estimate were higher than the next tender and the amount given happened to be a fair amount for the work, it might be given to the next tenderer.
9188. Is the departmental estimate more reliable than the competition of contractors? It often is.
9189. Are not the departmental estimates generally in excess of the tenders that come in? In some cases they have been less.
9190. But it has not been so in the case of these sewerage contracts? You must recollect that the sewerage contracts form but a small proportion of the contracts of the Department. The roads contracts are at all events the most diversified contracts the Department has.
9191. This was a contract of £40,000? You will find that what I say has often happened in the case of road contracts.
9192. Would not it be a safer plan to call for tenders again? That may or may not be so. One thing that often guided me was this—if a man or a firm had been tendering and doing work for the Department for a considerable time, and the Department had come to know that the firm or the man were good contractors, carrying out their work well, I would rather give the contract in a case such as you mention to such men, and save the Department trouble and perhaps loss from litigation. I would rather give a contract in such a case to a man of that kind than to a man who is always litigating. I know we had one case in connection with the railways where a contractor gave us no end of trouble upon every contract he had—so much so that I made up my mind never to give him another contract. It would cost us more through litigation than if we had given the contract to a man who tendered at a higher price. I am mentioning now one of a number of cases of the kind.
9193. If you had known that in this instance Carter & Co. had bought off Bond, the lowest tenderer, for £1,500, would you have sanctioned this business? I do not think I should. I cannot say definitely, but my impression is that I should not.
9194. Would it not have occurred to you that the State would suffer to the extent of £3,000 by the acceptance of Carter & Co.'s contract when the Department might have accepted a tender £3,000 less? It may not have suffered, because the man who tendered at £3,000 less may not have been able to carry out the work. If you have a man who is not able to carry out a work, you do not know where the expense of compelling him to do so is going to end.
9195. Suppose he puts up a £2,000 bond? That would be a reason for supposing that he could do the work, but a £2,000 bond in the case of a £40,000 contract is not much.
9196. It is provided in the specification? Yes, but £2,000 is not very much when you are considering the carrying out of such a large contract.
9197. Supposing the contractor were a substantial man such as Mr. Bond was? If I knew him to be a substantial man I should not have given the contract to another contractor. In any case I might not have done so had I known that the lowest tenderer had been bought off.
9198. Is it not the custom of the Works Department to have in all cases a cash good faith deposit put in with the tender? That is the usual practice, but it has been varied, especially in the case of road contracts. I remember great complaints being made to the Department that if we required a cash deposit in the case of every road contract a number of small men would be debarred from tendering.
9199. But in the case of big contracts, is it not the invariable custom? Yes.
9200. If the contractor forfeits the contract, is the custom to return the deposit? As a rule, it is not done, but it has been done in some cases—cases, for instance, where a man might really have made a miscalculation. If it were due to no fault of his own I should not hesitate to return him the deposit.
9201. Do you remember the deposit of £369 being returned to Mr. Bond in this instance? I do not remember it.
9202. Was it done with your sanction? I suppose it would be; but the papers would probably show.
9203. Would you have agreed to the cancellation of the tender and the return of the deposit if the whole of the facts which I have mentioned had been put before you? If I had been fully aware that the lowest tenderers had been bought off, and that they could have carried out the work, I do not think I should have sanctioned it.
9204. Do you recollect Contract 72? No; I cannot say that I recollect that particular contract.
9205. Do you not remember it, being brought under your notice in connection with Contract 79;—do you not remember having a conversation with Mr. Hickson or any other officer of the Department about it? I do not recollect that particular contract, although I know that I saw most of the works. If you are referring to the contract which was the subject of litigation through the cutting off of water from some wool-washing works, I do remember it. I remember the circumstances of the litigation, but I do not remember anything in particular about the work itself.
9206. You do not recollect that contract being discussed in connection with the letting of Contract 79? No.
9207. Do you recollect seeing the paper which I now hand you in reference to that claim? I see there is no reference to the minute-book upon the paper. These matters were very often inserted in the authority-book of the Works Department, and in that case there would be a reference upon the paper. I may have seen the paper, but I did not deal with it in any way, or my initials would be upon it.
9208. I suppose Mr. Hickson did not put the particulars of this claim before you;—you would take it from his word that there was such a claim? I think the chances are that I knew something of the claim before I dealt with it, but I could not say positively. If Mr. Hickson told me that there was a valid claim of £2,000, or £4,000, or whatever the amount may be, I have no doubt that, unless there was something which would cause me to investigate the papers, I should not have gone any further into the matter, but should have accepted Mr. Hickson's recommendation.
9209. *His Honor.*] You would not have considered the claim at all in that relation unless it were represented to you that it was a valid claim? I certainly should have refused to consider the claim unless I thought it valid.
9210. *Mr. Smith.*] Coming to the question concerning Contract 72—supposing the contract had been stopped by the Government, and that the contractors had been stopped from working for (say) five or six months,

W. J. Lyne.  
15 July, 1896.

W. J. Lyne. months, and that they claimed compensation in respect to that stoppage, would you not think it a claim which it would be advisable to settle if you saw a chance of settling it? Do I understand you to mean that the work might be indefinitely postponed under the clause quoted by Mr. Parkes?

15 July, 1896.

9211. I mean, independently of any special claim in that agreement? I certainly should think that the contractors, even if they had not a legal claim, would, at all events, have a moral claim for compensation.

9212. In the absence of a special condition in the contract? Yes.

9213. Supposing that special condition which was read to you referred to part of the contract which had not been begun at all at that time—to another part of the contract altogether—would you have thought that the claim was one which ought to be settled if you could settle it? Yes, assuredly I should. From what I can gather since I came into the room, I imagine that the contract could not have been stopped under the clause quoted by Mr. Parkes. The matter must have come before me, and if I had understood before hand that the work was stopped under that clause alone I do not think I should have consented to give anything.

9214. You said you acted, as a rule, upon Mr. Hickson's advice. Had you every confidence in Mr. Hickson as an officer of your Department? Every confidence, and I always have had.

9215. You have heard of nothing since you have left office calculated to shake your confidence in him? It would take a great deal to shake my confidence in Mr. Hickson.

9216. *Mr. Gummow.*] With regard to the return of the deposit to Bond and Hudson, in a letter written by Mr. Bond on 28th September, 1891, he says, "On June 10th of this year we had the pleasure of submitting a tender for the above works, and we believe were successful in being the lowest tenderers. We have been anticipating the acceptance of our tender for some months, but, not hearing from your Department, we have in the mean time entered upon other obligations, and must consequently respectfully ask you to permit us to withdraw our tender, and to return us the deposit attached thereto now lying in your hands." That letter is signed by Mr. Bond. Would not the fact of your having kept them waiting so long be a sufficient reason for the return of the deposit money? Certainly, I have done so in many cases where we could not get on with the work as we expected to do. At that particular time there was a difficulty in getting loan money, and I made arrangements in many cases for funded stock which we issued in the Colony to be taken instead of cash. Many delays of that kind arose at that particular time in connection with the carrying out of works in consequence of my desire to keep the Loan expenditure down as low as possible, without finding money from sources outside the vote.

9217. As to tendering through the tender-box, I presume you know that the whole of the tender prices are put up within an hour or two after the tenders go in;—you know that they are made public? Yes, after the Tender Board has examined them.

9218. In the event of the lowest tenderer throwing up the work, would you consider it fair to re-call for tenders after the exposure of everyone's prices;—would not that be unjust to the contractors? That is one thing which sometimes guided me. The Department should decide what they are going to do beforehand, and I do not think they ought to take it upon themselves to call for fresh tenders unless there be some special reason.

9219. Supposing the price were from 5 to 10 per cent. below the Government estimate, would that be a fair reason for accepting another tender? In most cases I should accept another tender, but the case put before me by Mr. Parkes was one in which the lowest tenderer had been bought off. In a case of that kind I should probably not accept another tender.

9220. If the lowest tenderer has been bought off, would the Department know of it? I did not know of it in this case; you may be sure of that.

9221. *Mr. Parkes.*] I should like you to read a copy of Mr. Hickson's letter under date 13th October, 1891, stopping the works upon Contract 72, and, having read the letter, to tell me whether, if you had had that before you at the time, you would have consented to the claim of the contractors? That would be a matter for investigation. I cannot say that I would not have consented to it, because I have very great doubt as to whether the clause you have read from that specification applies in the way in which it has been sought to make it apply.

9222. Read clause 3 again, and tell me whether you do not think it refers specially to this case. Mr. Hickson in his letter says, "I have the honor to inform you that, in accordance with clause 3 of the specification," &c.? The clause you have asked me to read refers, I take it, to a portion of the sewer beyond a certain point. It refers, further, to an alteration of the works in a part other than that in respect of which the contractors made their claim.

9223. If you had known of Mr. Hickson's letter referring to that clause in connection with the stoppage of the contract, would you have allowed the claim? I should not like to say positively one way or the other what I would have done. If Mr. Hickson advised me that the contractors had a valid claim I should have taken his advice.

9224. You did not know of the existence of this paper? No; I did not. There is one matter to which I should like to refer. I have seen in the newspapers some reference to the extension of the North Shore Contract. That is a matter which applies to myself as well as Mr. Hickson. Carter & Co. were carrying out the North Shore Contract, and—when they had about finished the work—there was an extension to be done. At that particular time there was a good deal of distress about. The men who were employed upon the contract were likely to be turned adrift, and the question arose as to whether we should invite fresh tenders for the extension or not. I think that was the only time I ever saw Mr. Carter or some other gentleman, whoever it may have been, connected with the firm. I inquired what the cost of the extension of the sewer would be, and I think they wanted £16,000 or £17,000. The departmental estimate was about £12,000 or a little over, but they would not, for some time, take the lower sum, and I spoke to Mr. Hickson about it. He was certainly in favour of inviting fresh tenders, which I should have done had they not eventually taken the contract at the departmental price. I think I did, in my minute, write that there was to be no claim of any kind for extras. I am not quite sure about it, but I think I made some minute of that kind. Even after I had practically made up my mind to do this, Mr. Hickson suggested that fresh tenders should be called; but I wished to get the work on as quickly as possible. Besides, Carter & Co. had a good record in the office. I looked upon them as one of the best firms of contractors we had for that class of work, and I decided to accept their tender at the departmental estimate. What I wanted to say, however, is that Mr. Hickson never influenced me in the slightest degree to do what I did. The course I took was rather in opposition to the course which  
Mr.

Mr. Hickson desired me to take. I knew all the circumstances in connection with the case, and I am quite prepared to take the responsibility for what I did. W. J. Lyne.

9225. *Mr. Gummow.*] Mr. Parkes read you a letter of Mr. Hickson's under date of 13th October, 1891, in reference to the termination of the contract, and in which no allusion is made to the giving of compensation. Is it not usual for the Department to write letters of that kind to contractors asking them to stop work, and is it not usual under such circumstances for the Government to allow the contractors to make a claim, if any foundation for such a claim exists, for compensation;—it is not usual for the Department to say, in writing such a letter, "We will give you compensation?" Certainly not. The Department is not at all anxious to pay compensation unless it is necessary that it should do so.

15 July, 1896.

9226. A letter of that kind may be bluff or it may not be bluff, but it is for the contractors to see whether they can make good any claim? Yes. Notice would be sent from the Department that a certain thing is to be done, whether by way of alteration in the work or by way of stoppage, and if the contractors have any claim they must endeavour to make it good.

9227. If afterwards Mr. Hickson received notice of a claim from the contractors, backed up by various evidence, could he not alter any opinion expressed in his letter of 13th October, and give you reasons, although you may not remember them at the present time, for entertaining a claim for compensation? His letter would not bind him absolutely, I should imagine. I probably had several conversations with Mr. Hickson about the matter. In a large Department like the Works Department, where the Minister's time is pretty well occupied, it is not the custom to put everything in writing. I suppose other Ministers have acted as I did. I frequently sent for a particular officer, and asked him to explain matters to me, and in such a case there would be nothing in writing.

9228. This letter of Mr. Hickson's, of 13th October, does not actually bind him with regard to any compensation which may be claimed? No. He would be quite at liberty to vary it afterwards. The Department can always vary matters of that kind if it likes. Of course the last letter bearing upon a matter of that kind would be taken to have the greatest force.

John Carter recalled and further examined:—

9229. *Mr. Parkes.*] You hand in a statement giving full particulars of landed property held by Carter, Gummow, & Co.? Yes; a memorandum of the firm's property, including all fixed deposits in Banks. It may be incomplete as to some of the legal details, otherwise it is quite complete. J. Carter.

15 July, 1896

FRIDAY, 17 JULY, 1896.

George McCredie recalled and further examined:—

9230. *Mr. Parkes.*] You have perused the vouchers in connection with Contract 72? Yes. G. McCredie.

9231. The last voucher after the stoppage of the work was paid on January 20th, 1892? That is correct. 17 July, 1896.

9232. And you have ascertained the quantity of cement which would require to be used in the concrete and cement facing which has been done since that time? Yes.

9233. You saw the final certificate which was paid, in November, 1892? Yes.

9234. And you have taken out the quantity of cement used between the time of restarting the work and its completion? Yes.

9235. How many casks were used in the concrete and cement facing during that period? 3,432 casks.

9236. That is your report, is it not? Yes. In the final return the number of casks was given as 12,008, and in the ninth progress return the number given was 8,576, showing a difference of 3,432 casks.

9237. Therefore, if the claim made in October, 1892, contained an addition of 3,000 casks, that quantity would have been used in the interval between that date and the restarting of the works? Yes; that is the quantity which should have been used.

9238. According to your valuation? Yes.

9239. *Mr. Davis.*] Have you made your calculations for the concrete in this case on the same basis as your other calculations? Yes.

9240. You have estimated that 16 feet of bluestone metal would make 16 feet of concrete? Yes.

9241. And that 20 feet of sandstone would make 20 feet of concrete? Yes.

9242. *Mr. Parkes.*] You have put the three classes of concrete to a practical test within the last week? Yes.

9243. The concrete is not quite set yet? No.

9244. Still you are perfectly satisfied that your measurements are correct? Yes.

William Thompson recalled and further examined:—

9245. *Mr. Parkes.*] You have perused the vouchers in connection with Contract 72? Yes. W.

9246. You made a note of the quantities paid for at the time of the stoppage of the work? Yes, as shown by the ninth progress return. I have compared that with the final certificate. Thompson.

9247. And you have taken out the difference in the cement used during that period? Yes. 17 July, 1896.

9248. What do you make it? In the case of the sandstone concrete there is a difference of 2,356·59 yards, representing 3,181 casks of cement, and in the cement facing there is a difference of 4,149·79 yards, representing 237 casks of cement, making a total difference in the number of casks of cement of 3,418 casks. To that total may be added 21 casks for brickwork, making a grand total of 3,439 casks.

9249. You have made your report quite independently of Mr. McCredie? Perfectly.

9250. Had there been 3,000 casks of cement in the hands of the contractors at the time the works were restarted, that cement should have been used before they were completed? Yes.

9251. *Mr. Davis.*] I suppose you made your calculations upon the same data as those upon which your previous calculations were made? Upon exactly the same data as far as the quantity of cement is concerned.

William

William Henry Warren recalled and further examined:—

W. H.  
Warren.  
17 July, 1896.

9252. *His Honor.*] I believe you have made some researches in connection with the use of the Monier patent in public works, and are in a position to give us information with reference to the Monier system generally? Yes. In accordance with your instructions, I have written a report concerning the use of concrete with iron in the Monier and other similar systems. That report is as follows:—

THE use of concrete combined with iron in the Monier and other systems; by W. H. Warren, M. Inst. C.E., M. Am. Soc. C.E., Challis Professor of Engineering, University of Sydney.

CONCRETE in combination with iron or steel has been largely used during the last five or six years for a variety of purposes. In America the chief use made up to the present of this system occurs in the foundations of high buildings and in warehouse floors; but a few highway bridges have been constructed, consisting of concrete arches, in which iron or steel is used in combination with the concrete.

In Europe a large number of bridges have been constructed chiefly on the Monier principle, but there are several other methods which have been adopted both in America and Europe, among which may be mentioned—

- The Ransome concrete and twisted iron system.
- The Melan system.
- The Sidero cement (Bordenave system).
- The Wunsch system.

Probably the largest structure of this class in America occurs at Topeka, Kansas, where a fine arched bridge has been constructed over the Kansas River. The span of the central arch is 125 feet, and the width of the roadway and foot-paths is 40 feet over all. This bridge is constructed on the Melan system, which consists of steel ribs of the lattice-girder type, spaced 3 feet apart, centre to centre, and 26 inches deep, forming the metal skeleton of the bridge, filled in, and completely surrounded, with concrete. Probably the largest arch bridge yet constructed occurs at Munderkingen, in a road bridge over the Danube, and consists of a span of 164 feet, with a rise of 16.4 feet. The depth at the crown is 3½ feet, increasing to 3½ feet at the springing. In order to understand the function of the steel or iron in combination with concrete in arches, it is necessary to consider the stresses developed by the load in an ordinary arched bridge or viaduct. These consist of—

1. A compressive stress or normal thrust distributed uniformly over the area of the section of the arch.
2. A shearing stress at the section.
3. A bending moment, producing tension and compression on opposite sides of the neutral axis of the section.

The direct compression, combined with bending, produces an unequal distribution of stress over the section, which may be tensile at the intrados and compressive at the extrados, or conversely. The compressive strength of good concrete three months old may be taken at 1,600 lb. per square inch, while the tensile strength of similar concrete is about 160 lb. per square inch. These results are less than those obtained on small-size specimens. In the tensile tests the area under tension was 100 square inches, and in compression 144 square inches. The figures have been taken from a very large number of tests made on specimens prepared by the Sewerage Department in the University Testing Laboratory. The low tensile strength of concrete, compared with its compressive strength, has restricted its use in arches of large span, as failure would always occur by the fracture of the concrete under tensile stress. This has given rise to the various systems mentioned in which iron or steel is associated with the concrete in such a manner as to enable it to resist greater tensile stresses. One of the most extensively used of these systems is that introduced by Jean Monier, which consists of a wire-netting placed near the intrados in small arches, and near both intrados and extrados in large arches, in the body of the concrete, the sectional area of the iron or steel in tension being proportioned as much smaller than that of the concrete as its tensile strength is larger.

The iron netting used with the Monier system is not stiff in itself, and its co-operation with the concrete can be expected only after hardening. The following experiments were made at the University Testing Laboratory on slabs of mortar 26 inches long and 12 inches wide by 3⅜ inches thick. These slabs were supported at points 20 inches from centre to centre, and loaded in the centre until fracture occurred. The proportion of sand to cement was about 3½ to 1. In three of the slabs an iron network was placed 1⅛ from the lower side of the slab where tension was developed. The results of these experiments are given in the following table:—

CROSSBREAKING Tests of Monier Plate Mixings.

| Description.   | No.  | Proportions.      |       |        | Age in days. | Weight of specimen. | Breaking weight. | Modulus of rupture. | Age in days. | Weight of Specimen. | Breaking weight. | Modulus of rupture. |         |        |
|--|--|-------------------|-------|--------|--------------|---------------------|------------------|---------------------|--------------|---------------------|------------------|---------------------|---------|--------|
|  |  | Cement            | Sand. | Water. |              |                     |                  |                     |              |                     |                  |                     |         |        |

|  |  | Made without iron | 5     | 1      | 3.50         | 0.918               | 36               | 74.9                | 660.8        | 183.1               | 120              | 74.9                | 1,433.6 | 396.69 |
|  |  |                   | 6     | 1      | 3.38         | 1.108               | 36               | 74.9                | 788.5        | 216.2               | 120              | 74.9                | 963.20  | 272.50 |

The average value of the modulus of rupture, or co-efficient of transverse strength, was 608 lb. per square inch with the Monier plates and 351 lb. per square inch with the mortar only, without the Monier network. These results are about the lowest I have ever seen recorded, and are probably due to the rough handling they received in loading and unloading from the cart, with a number of other large specimens of concrete which were tested at the same time.

It is unfortunate that these experiments were not repeated, as other results obtained by similar tests give values about twice as great for Monier beams.

THE strength of the Monier arch, as compared with concrete and brick arches, also with combinations of concrete and iron or steel, arranged in a special manner.

By far the most valuable information on this subject is supplied by the results of an exceedingly comprehensive series of experiments conducted by a committee of leading scientific men and practical engineers, which were appointed by the Austrian Society of Engineers and Architects. The Committee built arches of all kinds and sizes (from 7 to 77 feet). These were tested by loading them and determining the elastic deformation, which means that after the load was removed the arch sprang back to its original form. The arches were also loaded to destruction, and the load which produced cracks was carefully noted.

The

The following results on arches of 8 86 feet span are tabulated —

RESULTS of Testing Arches of 8 86 Span.

| Description of arch tested | Rise of intrados in inches | Thickness of arch in inches | Total dead load applied on half span in pounds | Load applied on half span in lb per square foot |
|----------------------------|----------------------------|-----------------------------|--|---|
| Concrete                   | 9 1                        | 3 5                         | 4,430  | 1,128   |
| Monier (1)                 | 10 2                       | 2 0                         | 3,810  | 1,218   |
| Monier (2)                 | 10 2                       | 2 2                         | 5,410  | 1,320   |
| Brick (1)                  | 9 8                        | 5 5                         | 4,170  | 835   |
| Brick (2)                  | 5 3                        | 3 9                         | 3,010  | 492   |
| Corrugated plate (1)       | 9 8                        |                             | 2,970  | 974   |
| Corrugated plate (2)       | 10 2                       |                             | 2,130  | 1,100   |

The method of testing consisted in levelling the top of the arch, which was built between rolled beams as in ordinary floor construction, with plates and channel bars at ends, and tie rods in the middle. A board-floor was laid upon the top of the arch and loaded with pig iron. The arches were made in each case four months before testing. The loads were gradually applied, and at each increment of 200 pounds the horizontal and vertical displacement at the crown of the arch was carefully measured. It was observed that the concrete arch deflected less than one half the brick arch.

Another series of experiments was made on spans of 13 3 feet, with the following results —

RESULTS of Testing Arches 13 3 feet span.

| Description of arch tested | Rise of intrados in inches | Thickness of arch at crown, in inches | Weight of steel used in pounds per square foot | Breaking load in lb per square foot |
|----------------------------|----------------------------|---------------------------------------|--|-------------------------------------|
| Brick in cement mortar     | 15 $\frac{3}{4}$           | 6                                     | .. ..  | 321 5                               |
| Concrete                   | 15 $\frac{3}{4}$           | 4                                     | .. ..  | 737 3                               |
| Monier                     | 15 $\frac{3}{4}$           | 2 $\frac{3}{4}$                       | 4  | 839 7                               |
| Melan                      | 11                         | 4                                     | 1 4  | 3,360 0                             |

The Monier arch had one wire net 2  $\frac{3}{4}$  in by 2  $\frac{3}{4}$  in meshes made out of  $\frac{3}{16}$  in round wire. The load was applied on half the span. The cracks observed occurred in the concrete arch with twice the load which was necessary for the brick arch, and in the Monier arch it required two and a half times the load necessary for the brick arch.

The Melan arch was made with I beams 3  $\frac{3}{4}$  inches deep, and was one year old when tested.

Five other arches, each 75 4 feet span, 15 1 feet clear rise, and 6 56 feet width, were especially constructed for the purpose of experimenting, and were tested to destruction. One load was applied at six points over half of the arch, and the thickness of each arch, and the rupturing load, are as follows. —

TESTS of 75 6 feet span.

| Description of arch tested | Thickness of arch at crown in inches | Thickness of arch at springings in inches | Ultimate breaking load in lb per square foot |
|----------------------------|--------------------------------------|---|--|
| Rough stone                | 23 6                                 | 43 3                                      | 660  |
| Brick                      | 23 6                                 | 43 3                                      | 602  |
| Concrete                   | 27 6                                 | 27 6                                      | 742  |
| Monier                     | 13 8                                 | 23 6                                      | 1,300  |

The stone arch was of rough quarry stone, laid in mortar made of 1 part Portland cement and 2 6 parts of sand. Both the stone and the brick arch were tested fifty one days after their completion, and the manner of failure was similar in each, radial cracks appearing on the extrados near the skewback on the loaded side, and over the haunches on the unloaded side. The steel arch was formed of ribs spaced 5 9 feet centre to centre, each rib having a solid web, with flanges of angles and plates, while the ends abutted against pins at the skewbacks. Failure occurred by the lateral bulging of the unloaded half of the arch.

It will be observed that the Monier arch carried 1 75 as much as the concrete arch, although it was only half the thickness at the crown. Comparing the carrying capacity of these large arches with that of the smaller ones it will be seen that the economy of the Monier principle is proportionately greater. This result might have been anticipated, as failure occurred by lateral deformation in consequence of the bending moment produced by the partial loading, which called into play the tensile strength of the concrete to a greater extent than in the smaller arches.

The following considerations should be noted in connection with the strength and durability of the Monier system. In regard to the association of iron and cement mortar in arches or beams on the Monier system, it might be urged that two such materials could not be expected to work together, and that the cement would probably crack before the tensile stress was distributed over the iron net work. This is answered by the experience of the late Professor Bauschinger, of Munich, who found that the cement mortar adhered to the iron with a force of 336 lb per square inch. The adhesion of cement mortar to bricks and stone is very much less, and the average of a large number of experiments made by the writer gave for bricks with cement mortar in the proportion of 3 to 1—using Nepean River sand 24 lb per square inch, and with crushed sandstone 48 lb per square inch. These results were obtained by testing specimens twenty eight days old. Although these results are less than those obtained by Prof Bauschinger for cement mortar and iron I see no reason to doubt their accuracy, indeed no one who knew the work of the late Prof. Bauschinger could possibly doubt the accuracy of any result he published. Cement mortar is an elastic material, although its limit and modulus are most difficult to determine, but Prof Back, of Vienna, gives the modulus as 750,000 lb per square inch, which is much lower than those given by other experimenters. Taking into consideration the elasticity of the cement and sand compo, with the adhesive strength of the compo to the iron net work, it follows that these two materials should work well together in the Monier arch, provided that the areas of the two materials are so proportioned that the resistance to compression of the compo without the iron is equal to the resistance to tension of the compo with the iron net work. This will be true, provided the relative stresses in the iron and the mortar are always within the adhesive strength, which appears to have been the case in the experiments on arches and beams, the results of which have been tabulated. As to the durability of the iron surrounded with cement mortar, all experience goes to show that iron is perfectly preserved from rust, and will show a clean surface after it has been buried for years in cement mortar. Iron is said to form a silicate with the mortar, which acts as a protective coating, resisting all further oxidation. This was one of the reasons which induced the writer to recommend that the steel cables in the North Sydney suspension bridge should be surrounded with 3 to 1 cement mortar, and the tunnels leading to the anchorages should be filled up with concrete. As to the effect of variation in temperature in producing relative stresses in the mortar and iron net work, the coefficient of expansion of iron is 0000145, and of cement mortar 0000137 to 0000148 so that the small relative stresses, due to the small alterations in length of the two materials, would be completely equalised by the elasticity and adhesive strength of the mortar.

W. H.  
Warren.  
17 July, 1896.

As to the method of putting in the compo. or mortar in the Monier arch and incorporating it with the netting of iron, the cement and sand used should be of the very best description, and the compo., formed by mixing 1 part of cement to 3 of coarse Nepean sand, or crushed sandstone, should be thoroughly packed and rammed round the iron network, the work being pushed on so as to avoid the possibility of anything approaching a dry joint in the arch, the object being to form a homogeneous mass of mortar or compo. surrounding the iron. The quantity of water necessary to be used in the compo., and the precautions necessary in work of this character, are similar to those used in the preparation of specimens of mortar and concrete for testing, and for making first-class concrete.

The price of such work, although not great when considered as a lump sum, is relatively large when considered at per cubic yard, in consequence of the smaller thickness of the Monier arch, and the extra cost of the materials and labour involved in building it in a satisfactory manner.

In the diagram appended to this report, two lines of pressure on resistance have been drawn for the Monier arch over Johnstone's and White's Creek. The lower line would apply to the arched ring without the iron rods, from which it will be seen that it cuts the intrados near the springing, which would indicate that the tension developed at the extrados at that section would be sufficient to cause fracture. The Upper Line shows the distribution of pressure for the Monier arch, and the tables give the results of the calculations from which this line has been determined. It will be observed that the line cuts, or nearly cuts, the extrados at a point 6·5 feet from the centre of the span, at a section marked DE on the arch, and which is shown to a larger scale in fig. 2, with the intensity and distribution of the pressure and tension over this section.

The maximum tension at the extreme edge is 466 pounds per square inch, and pressure 933 pounds per square inch. I have taken the carrier full of sewage and have probably over-estimated the loading, so that the values given are excessive, and apply only to the points E and D respectively.

In regard to wind pressure, I have calculated the maximum tension and compression due to a wind pressure of 30 pounds per square foot as allowed for in bridge work, and find that it only adds about 25 pounds per square inch to the above figures. The section considered, namely DE, is the least favourable, and hence it is not necessary to go further. I consider the arch to have the necessary strength and stability in consequence of the Monier system of network. It would, in my opinion, have been insufficient in thickness without it, at the same time with a network arranged near the extrados, in addition to the one near the intrados, the thickness might have been reduced still further. [*Vide Appendix J.*]

We may now consider those properties of iron and cement which make both materials especially fit to be used together.

- 1st.—The modulus of elasticity of concrete (after Professor Breck) is about  $\frac{1}{10}$  of that of mild steel. This great difference enables us to have in two neighbouring fibres a small stress in the concrete and a forty-times larger one in the steel.
- 2nd.—Professor Bauschinger found the cohesion between iron and concrete, after hardening, to be from 570 to 640 lbs. per square inch. This is more than the tensile strength of the best concrete. It acts like a glue if once hardened.
- 3rd.—Concrete is the best conservator of iron. The writer knows of a case where iron rods were found perfectly rust-free, having been imbedded in concrete below water-level for 400 years. There are many devices designed on this important property, and for the protection of iron concrete is better than paint.
- 4th.—The thermic expansion of both materials is the same, and change of temperature will not originate secondary stresses.

Bonnieau, a French author, gives the thermic expansion of Portland cement as 0·0000143 for 1° Celsius, while iron has 0·0000145, which is practically the same.

With regard to the Monier slabs which I tested I should like to point out that they were made at Arncliffe, and were sent up to the University in carts. The iron bars were projecting in such a way that they were liable to be knocked, and unless the men who brought them were given to understand that they were to be handled very carefully, the probability is that they would have been knocked about a great deal. That is the way in which I account for the comparatively low results which I obtained from them.

9253. The report you have read embodies the result of your researches and your own experience combined? Yes. I should also like to hand in a paper which appears in the journal of the American Society of Civil Engineers of April last. I have marked a few passages, and they may be taken to be embodied in my report. You will see that the paper deals with the question in a more concise manner, and I think that if one required to study the Monier system one could do so better by reading that paper than by obtaining more scattered information. I have also appended to my report a list of the literature on the subject so that it may be handy for reference.

9254. *Mr. Hickson.*] You visited the aqueduct work in progress at White's Creek and Johnstone's Creek? Yes.

9255. Have you made an estimate of the cost of the Monier arches? Yes. I have made a rough estimate of the cost of the compo. I could only do so of course from what I know of the quantity of stone and the quantity of sand which will go with the cement in the mortar. One cask of cement and 13½ cubic feet of sand will make 13½ cubic feet of compo., or half a cubic yard. In the case of compo. the cement fills in the interstitial spaces in the sand. One cubic yard of ordinary compo. requires two casks of cement. I have taken the cement at 10s. a barrel. I do not know what you would pay for it, but I generally pay a little more. I have estimated one cubic yard of crushed sandstone at 7s. 6d. That would make the cost of the material £1 7s. 6d. per cubic yard. The ironwork comes out at 7s. 6d. a cubic yard. The labour I have put down at £1 a cubic yard, timber at 10s. 6d., and supervision and plant at 8s., making a total of £3 13s. 6d. I do not know what would have to be added to that in the way of percentage or profit. That would make the amount a trifle more. I have taken out the arches alone. I have made a similar calculation in respect to the carrier, and I may mention that I never quite understood how the carrier was made until I inspected it. I see that blue metal topping is being used, and that would make the cost a little more. You would have one cask of cement, 6 cubic feet of sand, and 10 cubic feet of bluestone—producing 15 cubic feet in the work. That would make the cost of the cement 18s., the sand 3s., and the bluestone 8s. 4d. You will see that the material comes out at £1 9s. 4d. instead of £1 7s. 6d. for the compo. in the arches. I did not put in the labour in the carrier, because I did not think it necessary to work out the real cost to the contractors of that part of the work, but an estimate can readily be made upon the lines I have already given.

9256. I suppose you could in a few days furnish His Honor with an estimate of the cost of the whole of the contract as it is now being carried out? Yes. Of course I should have to take out quantities, unless the quantities which I understand have already been taken out were accepted.

9257. Am I correct in saying that the Monier system, judged by your tables, will make the structure twice as strong as if carried out upon an ordinary design? Yes. It would be practically more than that.

W. H.  
Warren.  
17 July, 1896.

I should not like to build arches of that thickness without the Monier system, even if you were to put the best of material into it. It looks a wonderfully light structure. The Monier system introduces a large element of strength. As the span of the arch increases, so does the strength imparted by the Monier system increase.

9258. You have based your estimate upon a full carrier? Yes, up to the brim, although I know that that would not happen.

9259. There are off-takes so that it would only flow two-thirds full? I know that it is usual for sewers to flow two-thirds full. I have allowed liberally for everything, and as I say I have not allowed for any assistance from the carrier. I think, from what I see from the plan now, that I may rather have overdone it. I may have been too severe upon the work. The small piers would scarcely discharge anything worth speaking of. If I had seen the drawings before I should have acted differently, because the carrier in itself would carry the weight of the sewage from the pier to where it joins the centre. Had I allowed for that it would make the arch come out much stronger. I may say this, however, that I do not think it would be safe to put in the work in that thickness without the iron net-work.

9260. Did you see the work being carried out? Yes; both at White's Creek and Johnstone's Creek.

9261. And you are satisfied that it is being efficiently and properly done? Yes, I was very pleased indeed with it.

9262. If you had been engineer-in-charge of the work, could you have suggested any other or better mode of carrying it out? No; what I saw there was first-rate in every respect. I was only there one afternoon, and I noticed that the concrete work was going on. I made a note of the material which was being used.

9263. Has your attention been called to a discussion which took place upon the Monier system in the American Society of Engineers? Yes; I have appended extracts from that pamphlet to my report. I may mention that I am a member of the Society, and that I receive their reports regularly. You will find the discussion at the end of the pamphlet I have handed in.

9264. Do you remember its being stated there that by the adoption of the system a saving of something like 60 per cent. would be accomplished;—was not that mentioned in the discussion? I think I saw that somewhere, but I did not pay much attention to it.

9265. When my attention was first drawn to this system I submitted a minute recommending its use wherever it could be used, and pointing out that there would be a probable saving of 50 per cent. in the cost of arches where it could be employed. In this particular work with which we are dealing, the cost of the arch under the Monier system is practically the same as the cost of a brick arch. That statement appears to be inconsistent with the statement contained in my minute. Can you explain why there should be a saving of 50 per cent. in the case of some bridges or arches and no saving in other cases? This is a special case. You have a big carrier, and there is only one net-work. Your thickness is greater than would be usual with an arch of that span.

9266. In ordinary circumstances there would be two nettings, one in the extrados and the other in the intrados? Yes; I cannot quite make a comparison between the cost of compo. and brick, because in the one case the work has never been attempted. I do not see what you could have done more than you have done. I, myself, should have done about the same thing with the material. There being a distributed load there is no necessity to put in a double system of netting. You might reduce the arch slightly by a double system of netting. Then there is the wind pressure to be considered. That is considerable in this case. It would not occur in ordinary bridges to the same extent; but that is not a very serious addition.

9267. In a wide road bridge you could reduce the thickness of your arch very considerably? Yes; you would have to put in double net-work, otherwise there would be cracking at the extrados of the haunches.

9268. While there might be a considerable saving, say 50 per cent., by the adoption of the system in the case of a wide road bridge there would not be a great saving in a narrow arch like this? I do not know what the difference in saving would be exactly; certainly it would not be the same.

9269. It has been suggested by some one that the carrier in this case would not be water-tight. If it were rendered with a 1 to 1 cement, would not that make it water-tight? It has always made work water-tight in every structure of the kind which I have seen. It is the only thing to make a work of the kind water-tight. I think I could point to large water reservoirs which are absolutely water-tight where this material has been used without puddling.

9270. And in those cases there would be a large head of water, whereas in this case there would be only 3 or 4 feet? Yes. I remember being responsible for some tar wells in which there would be 30 feet head of water, and we had a rendering of 1 to 1 cement on the inside,  $\frac{1}{2}$  inch thick. There was another thickness just underneath; but it shows that cement rendering is about as good as anything to make a tank or sewer water-tight.

9271. You regard the structure as perfectly substantial and durable? Yes; I feel thoroughly convinced about that. I should not myself care to reduce down to the thickness which you see mentioned in some cases where the Monier system has been used. It would be very different from anything we have been accustomed to, and in the first case of the kind one naturally likes to leave a little margin. I do not think any undue margin has been left in this case.

9272. Do you know the terms upon which the contract has been let? No. I only know from reading the newspapers that the system was substituted for the ordinary system—meaning, I suppose, ordinary brick arches.

9273. Supposing the contract is to be carried out under a guarantee for three years, would you consider that the country was running any risk? No; because, in much less time than that, if any cracks are going to develop they will be apparent. It is quite possible that, notwithstanding every care and attention, some cracks will develop. It would be almost impossible to avoid a certain number of hair-cracks.

9274. But anything which is likely to occur in that direction would occur before the expiry of three years? Yes, undoubtedly. I should say it would occur in twelve months, if it is going to occur at all; up to that time the work will increase in strength very rapidly.

9275. *His Honor.*] As to the value of crushed sandstone in relation to Nepean sand, can you give us any information? Yes; I can give you the results of many tests.

9276. *Mr. Hickson.*] Can you give us the value of crushed sandstone used for sand in concrete compared with the sand which would be generally used round about Sydney? Yes. I have made tests of the various

W. H.  
Warren.  
17 July, 1896.

various descriptions of sand. I can give you the tensile and compressive strength, and also the transverse strength. I have tested for thirty days, ninety days, six months, and twelve months. The Surrey Hills sand gave a tensile strength in pounds per square inch of 134·7; the Liverpool sand of 143·5; the Emu Plains sand of 201·14; and crushed sandstone, 152·74. Taking the ninety days' tests, the Surrey Hills sand gave a tensile strength of 172·1 lb.; the Liverpool, 165·8 lb.; the Emu Plains, 234·4 lb.; and crushed sandstone, 216·5 lb. Then taking the six months' tests, the Surrey Hills sand gave 201·54 lb.; the Liverpool, 204·7 lb.; the Emu Plains, 280·3 lb.; and crushed sandstone, 244·3 lb. Then taking the twelve months' tests, the Surrey Hills sand gave a tensile strength of 224·42 lb.; the Liverpool sand, 238·5 lb.; the Emu Plains sand, 272·0 lb.; and crushed sandstone, 286·5 lb. I will now give you the compressive strength in pounds per square inch. Taking first the thirty days' tests, the Surrey Hills sand gave a compressive strength of 1,932 lb.; the Liverpool sand, 1,240·7 lb.; the Emu Plains sand, 1,854·1 lb.; the crushed sandstone, 1,100·6 lb. Then taking the ninety days' tests, the Surrey Hills sand gave 1,617 lb.; the Liverpool sand, 1,569·4 lb.; the Emu Plains sand, 2,242 lb.; and crushed sandstone 1,671·5 lb. Taking the six months' tests, the Surrey Hills sand gave 2,068·7 lb.; the Liverpool sand, 1,887·1 lb.; the Emu Plains sand, 2,459·9 lb.; and crushed sandstone, 1,499·4 lb. Then take the twelve months' tests, the Surrey Hills sand gave 2,025·9 lb.; the Liverpool sand, 1,612·0 lb.; the Emu Plains sand, 2,674·2 lb.; and the crushed sandstone, 1,532·3 lb. I will now give you the coefficient of transverse strength in lb. per square inch. Under the thirty days' test the Surrey Hills sand gave 280·5 lb.; the Liverpool sand, 277·1 lb.; the Emu Plains sand, 376·9 lb.; the crushed sandstone 288·6 lb. Taking the ninety days' tests, the Surrey Hills sand gave 373·3 lb.; the Liverpool sand, 381·75 lb.; the Emu Plains sand 545·5 lb.; and the crushed sandstone, 421·9 lb. The Surrey Hills sand in the six months' tests gave 457·5 lb.; the Liverpool sand, 480·9 lb.; the Emu Plains sand, 510·9 lb.; and the crushed sandstone, 516·7 lb. Taking the twelve months' tests, Surrey Hills sand gave 546·2 lb.; the Liverpool sand, 440·6 lb.; the Emu Plains sand, 562·5 lb.; and the crushed sandstone, 578·4 lb. The transverse tests are very valuable, because they embrace both the compressive and tensile strengths. You will see that crushed sandstone is the highest of all in the coefficient of transverse strength. In the compressive strength tests it does not do so well as the Nepean sand, and in the tensile strength tests the Nepean sand is a little better than the crushed sandstone. I have crushed sandstone at the University, which I use as a standard, because it is uniform in quality. It is sifted through two sieves—a 900 and a 400 mesh.

9277. *His Honor.*] The sand is not washed, is it? No. I may mention that the Emu Plains Company, the Surrey Hills Company, and the Liverpool Company, supplied me with sand for tests, and I have put the results down for my own guidance; but for the purposes of my tests at the University I generally take some crushed sandstone out of my own box. I think I have some at the University now. I may mention that the Emu Plains sand is of two qualities. Some of it is coarse and some of it is fine. The coarse sand is much the better for the making of compo.

9278. *Mr. Hickson.*] I see from your tests that the twelve months' test, so far as the coefficient of transverse strength is concerned, gives the best results for crushed sandstone? Yes.

9279. *His Honor.*] Do I understand that the crushed sandstone is sifted for your tests? It is sifted, but not washed.

9280. Through what is it sifted? Through 400 and 900 mesh sieves, so that I get a uniform quality. It is necessary for testing purposes to have it uniform. The grains used are those which are found between the sieves.

9281. In the 900-mesh sieve do you find that you get much dust out of it? A little. I cannot give you the exact quantity. Of course we take the sand which is sifted, and the rest is thrown away.

9282. Mr. Young's idea, according to his evidence—and he said that that was his experience—was that the Sydney sandstone contained a good deal of clay mixed with the particles of silica? I have done a good deal of testing in the case of sand, and I should say that what you are speaking of would depend upon the sandstone used. The Sydney sandstone varies wonderfully. The Pymont sandstone and some of the Waverley sandstone is first-rate stuff. I have never found any appreciable quantity of clay in it.

9283. Mr. Young said that even the hard crystalline white sandstone contained a considerable portion of clay? I should not say there was a considerable quantity of clay; there may be a trace of it.

9284. Does the clay, in so far as it exists in the sandstone, affect the question of gradual shrinkage in compo. after it has been in position for some considerable time? I do not think so. Even if there were any considerable quantity of clay in the sand you would find it out very quickly in the tensional stress.

9285. You think it would reduce the tensional strength of the material? It would prevent the adhesion of the sand to the cement. Our experience is that we do not find much material difference between the standard sand and other sands. The Nepean sand is a little better if you get the best of it. It is not quite so good if you get the finer grains. Still there is not a very great difference. If there were clay in the sand to any appreciable extent it would show at once in the test. There can be no question about the absence of clay in the case of the Nepean sand, because it is washed. At all events, the small quantity which might be present in any case would not affect the shrinkage.

9286. Mr. Young's impression—and he said it was to a certain extent his experience—was that there would be a gradual slow shrinkage after the setting;—this shrinkage would go on for some considerable time? I do not think so. I do not quite know what he means by a gradual and slow shrinkage. If you used a micrometer you might find a slow shrinkage, but I think it would remain constant in volume.

9287. After setting? Yes, of course. The cement itself expands in setting. You can smash a glass tube with the expansion.

9288. Chemically, what is ordinary Portland cement? It is a complex double silicate. It is considered by one eminent chemist to be so and so, and by another to be something else. Of course it is a silicate.

9289. *Mr. Hickson.*] I suppose that if there were any clay in the sand it would show at once in the cracks in the work—in the honeycombing and in the shrinkage? Yes, if there were any quantity. If there were any appreciable quantity of clay in the sand I should have discovered it long ago in my tests. The assertion is quite new to me.

9290. When you were at White's Creek and Johnstone's Creek the other day did you see crushed sandstone being used in the Monier arches? I never examined the sand.

9291. Then you could not say whether you thought it good or not? I did not take much notice of the sand. I was more interested in the size of the bluestone metal which was being used. I had not a good opportunity to observe the sand. There was not much of it lying about at the time I was there.

9292.

W. H.  
Warren.

17 July, 1896.

9292. You examined the arches, some of which have been erected for some time, and you noticed no shrinkage, did you? No. The work which I saw being carried out was on the carrier. The arches had been finished. Of course the contractors would naturally push on with them until they had finished them, and I noticed nothing wrong with the arches.

9293. *His Honor.*] It is, as a matter of fact, the water of crystallisation that affects the cement? Yes. The cement is made by mixing clay and chalk. It is then calcined at a high temperature, and is afterwards ground.

9294. Is all the water that is mixed with it supposed to become water of crystallisation finally, or is any of it supposed to pass off by evaporation? Some of it must pass off by evaporation. It depends upon whether you mix it upon a non-absorbent body, such as slate or glass. In the carrying out of work you cannot do that. You have always to put more water in concrete which would be made under those circumstances than you would put in test specimens.

9295. So that you would hardly get so good a material? I would not say that, because you want to get the minimum quantity of water in the work. You do not want what you lose. It is the minimum quantity that you wish to get.

9296. But speaking of the water contained in the body of the concrete or compo.,—do you say that it actually passes away by evaporation? If by ramming it tightly you just find the surface damp, you know that you have got the right quantity in. In the laboratory we measure accurately the quantity to be put in. We always have the same quantity in mixing, because we want to test under exactly the same conditions.

9297. The whole of the retained water ought to become, finally, water of crystallisation? Yes.

9298. It is not capable of evaporating later on? No.

9299. So that perfect setting is inconsistent with the idea of evaporation later on? Yes.

9300. And it ought to be inconsistent with the formation of even hair cracks? Yes; of course what takes place in the setting one scarcely knows, except that a silicate is formed somehow or other which gradually increases in strength with age.\*

9301. As to the amount of water of crystallisation, I suppose it is impossible to say what the number of equivalents would be;—I suppose they vary? I do not think that has been done. A number of eminent chemists have investigated the subject, but they have not dealt with it as they have with alum and other well-known chemicals. The water of crystallisation depends upon the chemical composition. I was talking about the matter to Professor Tetmejer, at Zurich, who has done more in connection with cement than anyone else. He is the highest authority on the question.

9302. Practically it comes to this: will a very high temperature or a dry season cause properly-set compo.—compo. set perhaps for twelve months or more—to shrink further? I think not.

9303. Even if it contained a little free uncrystallised alumina? I do not admit that it does contain any but a minute trace of alumina; but I do not think there is the slightest danger of well-made compo. giving any trouble whatever through ordinary changes in temperature. You can test that by examining similar works in which cement rendering has been used.

9304. The question further crops up as to permeability—that is as to the water-tightness of the rendering upon a body of concrete or compo.;—it is a very well-known fact that in buildings the rendering, which is generally called cement, upon the walls does not actually keep the rain out unless it is painted, showing that there are hair cracks, although you cannot see them, through which the water manages to get;—how do you explain that and make it consistent with the fact that the carrier in a case of this kind would be actually water-tight? All material is more or less porous. You can get air through a solid brick wall. Air can be made to pass through a brick itself under a not very high pressure. I have an apparatus which I use for testing the permeability of concrete, and I frequently have a 10 or 12 foot head on. With neat cement you can easily get that.

9305. Without any apparent leakage at all? Without any apparent leakage.

9306. An instance given of the alleged inability of cement to keep water in is that of the aqueduct near the Prospect reservoir;—have you seen that aqueduct;—it is an aqueduct over a sandstone gully? I saw it a long time ago.

9307. According to Mr. M<sup>c</sup>Credie, it is leaking still? There may be many cases in which cement would not be water-tight, but it is the best known means of making these structures water-tight. It is used all over England and America. It is the recognised system for making reservoirs water-tight.

9308. It is used sometimes without any backing or puddling? It is not necessary to put puddling in if you have a cement rendering.

9309. I mean in the case of a reservoir? I am speaking of a service reservoir, not a storage reservoir. In an ordinary reservoir it is a common practice to put in cement rendering without any puddling at the back. It is generally considered that that would make the reservoir water-tight.

9310. It is found to be sufficient, you say? Yes. They decide what they will do according to the material at hand and the cost. Sometimes cement is used, and sometimes the puddling is depended on.

9311. *Mr. Hickson.*] As a matter of fact, the putting in of puddling behind the concrete walls of reservoirs has been entirely given up? Yes, I believe it has.

9312. All the storage reservoirs in the neighbourhood of Sydney are rendered? Yes.

9313. And they are quite water-tight? Yes. A paper was read by Mr. Darley before the Royal Society giving a list of all the reservoirs which had been constructed and the mode of construction, so that the matter can be easily verified.

9314. *His Honor.*] No reservoirs recently built have been puddled? No.

9315. *Mr. Gummow.*] You say that you did not particularly notice the sand which was being used out at White's Creek and Johnstone's Creek? I did not examine it; that is, I did not feel it or do anything of that sort.

9316. You state in your report that you have taken the compressive strength of compo. at 1,600 lb. to the square inch at three months? Yes; that was concrete, not compo.

9317. What would you consider a fair compressive strength of compo.? 2,000 lb.

9318. And if the sand which is being used will stand 2,000 lb. to the square inch you would be satisfied with its use? I should say that it was good material. Looking down my list of tests, I see that there is only one case where 2,600 lb. is given, and that is in the twelve months' test. 9319.

\* NOTE (on revision):—The setting of cement, according to Pettenkofir, seems to make the process consist (1) of the formation of a silicate of lime and the hydration of the silicates of alumina and iron; (2) further, in the reaction of the silicate of lime on the other silicates, forming double hydrated silicates. According to Frey, there is (1) a formation of an aluminate of lime, and of hydrates which attain considerable hardness; (2) a reaction of the calcium hydrate on the basic calcium silicate. Experiment seems to show a progressive increase of combined water in hardening cement.

W. H.  
Warren.  
17 July, 1896.

9319. At what age would you put the 2,000 lb.? Ninety days. I have not anything in my list over 2,000 lb. except for ninety days. I get higher results, of course, in six months and twelve months. I should not expect 2,000 lb. in thirty days.
9320. I suppose the work out at White's Creek and Johnstone's Creek would not be used under ninety days? No. I think it would be longer than that in course of construction.
9321. As to the expansion of compo.;—can you give His Honor any particulars as to that? It is referred to in my report.
9322. Do you consider that compo. or concrete will expand under heat? Certainly, every substance will expand. Clay contracts, but, on the other hand, stone will expand under heat.
9323. You made some tests of the adhesion of brickwork, and you say that crushed sandstone gives you double the value of Nepean sand? Yes. That is the average of a large number of tests (say) 300.
9324. Then from the adhesive point of view you prefer crushed sandstone? Certainly.
9325. Have you seen what Mr. Bagge says as to the three alternative schemes concerning which he was asked to make a report? No.
9326. *Mr. Parkes.*] Do you not receive State pay? No; I am Challis Professor of Engineering. That is a special endowment.
9327. Are you not constantly making tests for the Public Works Department? Yes.
9328. And are you not paid for those tests? Yes.
9329. By whom are you paid? By the Government.
9330. What are you paid for making these tests? It depends upon what the tests are.
9331. Have you not a fee for testing? Yes. Supposing that three pieces of iron are sent up to be tested for tension and report—there would be a fee of £3 3s.
9332. How many tests have you made of the Monier arch system at different times? Not many—six, I think.
9333. Upon what date did you make the first test? On October 26th, 1894.
9334. Had you, at that time, any communication with Mr. Baltzer, who held the patent? No.
9335. Did he not come to see the tests made? No. I do not think the tests were made by Carter, Gummow, & Co. They were made in the ordinary way. Mr. Davis sent the slabs up, therefore he would know all about them.
9336. Were they made at Arncliffe? Yes.
9337. Near the sewerage works there? Yes. They were prepared there and sent to me to be tested. I did not make the slabs as I usually do. They were made by the sewerage branch, under Mr. Hickson, and were sent to me for testing.
9338. At the Government expense? I think I had better explain the circumstances. I was asked by the Government whether I would test about 60 blocks and what my fee would be. I was about to make a series of tests in concrete. We do not get paid for a thirtieth or a fortieth of the number of tests we make. We make them to get constants for calculation of strength. We do a lot of work of that class for ourselves and quite apart from the Government—just in the same way that we investigate other things at the University. I saw an opportunity in this offer of the Government for making a good series of tests, and I said, "If you will make all the blocks that are required, as the matter is one of scientific interest, I will make the tests for nothing." So that we were really not paid for them. The blocks were made at the sewerage works and were tested at the University.
9339. Under Mr. Davis' instructions? Yes.
9340. You have been to Europe lately? Yes.
9341. Did you see any Monier work in construction there? I saw some in America.
9342. Did you see none in Europe? No, but I discussed the system with various persons.
9343. You saw no Monier work being actually carried out there? No, not in Europe.
9344. What was the nature of the work you saw being carried out in America;—was it the Monier patent proper? Yes.
9345. Was it patented in America by the original Monier? I do not know. I looked upon it as a piece of construction in which iron and concrete were used, and I was only interested in it to that extent.
9346. Is it not possible that there may be a special silicate in the Monier system which is unknown to the public so far? I should hardly think so.
9347. Has not a special cement to be used in the work? Thoroughly good cement.
9348. But I mean specially gauged and tested cement? Yes. Thoroughly tested. For all good work you must use good cement. The material used in the Monier work, as in other work, must be thoroughly good. The very best of cement should be used.
9349. Do you think Mr. John Try's cement, made at Merrylands, is good enough for this kind of work? I have never tested it.
9350. Have you ever heard the figures resulting from the tests? I have heard of them, but I do not remember them.
9351. Have you heard whether it has or has not stood tests? Of course it will stand tests, but I do not know their nature. I have never seen a test-sheet of Mr. John Try's cement. I have not taken any special interest in it.
9352. Do you think it is the proper Monier patent which is being used in connection with the aqueducts at Johnstone's Creek and White's Creek? I should think so.
9353. Have you looked at the patent? No; but the work is similar to the work which I saw in America, and to the work which is described in the journal of the American Society of Civil Engineers.
9354. How do they connect the intersections of the net-work used in the arches in America;—in what way are they tied? I have seen some tied; but I do not remember at this moment the particular way in which they are tied.
9355. Have you seen it riveted or otherwise fixed at the intersections? It would not be the Monier system at all if it were riveted.
9356. Have you actually carried out any construction in this Colony? Yes; there is the North Shore suspension-bridge. Mr. Coyle was the engineer and I was the consulting engineer. I have also done some work in connection with the Parramatta water supply. I was responsible for some thousands of cubic yards of concrete in retaining-walls and arches in connection with large gas works at Manchester.
9357. Is it not a fact that iron and steel in association with cement and concrete have been used for years past in this Colony? Yes; in tie-rods for arches.

9358. But I mean iron in any form associated with cement or compo.? I could hardly say "associated with it." I should call it "associated" in the case of the Melan and the Wunsch system where you bury the iron in concrete to get strength out of it.

9359. But has it not been used here constantly? I do not know of it.

9360. Have you never heard of it being used? No.

9361. Mr. Young told us that he had used it in the form of a lattice for roofing—in the substructure of roofs for tiling? I know that galvanised iron has been used in arches with concrete, but that is not one of the systems we are dealing with.

9362. Has not iron been used in foundations in both lattice work and in long bars? You get something approaching the system in foundations. When you bury rolled girders in concrete you get something of the same kind.

9363. In diagonal bar work in foundations—in lattice or bar work set diagonally—is there not the same thing practically? I do not know precisely to what you refer.

9364. Do you know of another patent in existence for the same class of work? Yes. I have referred to several systems in which iron is buried in concrete.

9365. I mean a patent in this Colony? I do not know of it.

9366. Suppose the Government were to adopt the method in a form other than that in which it is tied at the intersections, could they not use it without paying any royalty? Well, that is a matter of law.

9367. As regards sand, you read your tests of some of the Emu Plains Gravel Co.'s sand? Yes.

9368. In the circular issued by the Emu Gravel and Road Metal Co. some tests are given, presumably with your authority;—the tests do not appear to be the same as those you have read out? In the circular the tests given are a summary taken out from the list.

9369. But they are what you supplied to the company, are they not? Yes.

9370. Do they not go to show that the Emu Plains sand is very much better than crushed sandstone? The results in my list show that the Emu Plains sand is better than crushed sandstone.

9371. Does the summary of tests, published by the company, include the whole of your tests? No; it does not include the tests made for twelve months. They have since been supplied with the tests for the twelve months, and if they are included it will be found that the figures, when averaged, correspond exactly with the figures in the book.

9372. Would it not be preferable, in all constructions of this kind, to use the pure gritty sand instead of crushed sandstone? If you could get Emu Plains sand, of a coarse description, you could not have anything better.

9373. Where did you get the crushed sandstone with which you made your tests? From Saunders' quarry at Pymont.

9374. Was it not the best bottom block stone? I could not say; I had to take the chippings he would let me have. A man was sent down with a cart and he brought the chippings away.

9375. Would the chippings be from the Hellhole or Purgatory quarry? Yes, I suppose so.

9376. That is the hardest Sydney sandstone there is? Yes.

9377. Have you obtained it lately? Yes.

9378. The quarries I have named are the only quarries that are working there now, are they not? If they are the only quarries working there now, of course the chippings would come from them.

9379. Suppose the sand used at White's Creek and Johnstone's Creek were made from the upper surface stone coming out of the cuttings and tunneling, what would you say in regard to the quality of the sand? I should like to see it. Sometimes, of course, it would not be so good as sand from the lower stone.

9380. As a matter of fact, is the upper surface sandstone of any use for sand? Not for sandstone, but whether it were of use for sand or not would depend upon what it turned out to be after it had been tested.

9381. Did you test the sand from any inferior stone? I did not test any from the upper layers of Pymont stone, but I tested a lot of ordinary sand.

9382. Had it been cleaned of organic matter? I mean taking the sand as we got it. I put in some cheap concrete the other day at the University: we were pressed for money, and we had to take the ordinary sand from Surry Hills, and the results were very similar to those which I have given you.

9383. It would be washed by rain to a certain extent, would it not? It would not be specially washed; we took it as we got it.

9384. Would you consider the sand used at White's Creek and Johnstone's Creek good sand if it were made up of stone coming from the upper surface, and if it had not been washed? I did not examine it.

9385. Supposing it had been made from sandstone such as I mentioned, and had not been washed, would it be good material? If it contained a lot of fine stuff of course it would not be as good as the crushed sandstone from which my tests were made.

9386. The sand to which you refer was sieved to get rid of all the fine stuff? To get a uniform material on which we could rely.

9387. What would be the result to compo. or concrete made out of fine unsifted sand? It would not be as good as compo. made out of a coarser material.

9388. You mean in tensional and compressive strains? I think it would show all round.

9389. When you were out at the works at Johnstone's Creek and White's Creek, did you notice the iron which was being put in? I examined the grid.

9390. What was being done with it? It was being put into the side of the carrier.

9391. Was there any rust on it? I should not consider it rusty; it was black iron.

9392. Was it yellow? No.

9393. Had it its native blackness? Yes.

9394. There was no rust on it at all? Not on the grid I saw.

9395. Speaking of the use of cement in reservoirs, can you tell us of any reservoir in this Colony made of cement compo., or concrete, holding water? All the reservoirs have been constructed under Mr. Darley, and he would be able to tell you if any were not water-tight.

9396. Are they holding water? I believe they are.

9397. Have you been to Potts' Hill lately? That is an excavation. It is not lined.

9398. Have you been along any of the channels, which are made of concrete, on the aqueduct running from Prospect? They are not made of concrete. They are made of stone. I believe many of them have been puddled at the back.

W. H.  
Warren.  
17 July, 1896.

W. H.  
Warren.  
17 July, 1896.

9399. Some of them are of cement, are they not? I cannot recollect at this moment. I have been along the whole of the work, and the general construction consists of large stone blocks without anything at all between them.

9400. Even the oldest and the best of cement, with the best provision, even if put in  $1\frac{1}{2}$  inch thick, would show a uniform dampness after heavy rain, although there might be no apparent hair-cracks? Yes; I have noticed that at times.

9401. Will you look at the Monier plan and tell me the space between the invert of the carrier and the top of the arch? It would be 6 inches and the rendering.

9402. Suppose the cement became soaked with foul matter from the sewage, would it not be a menace to the structure in hot weather—when the work was exposed to the heat of the sun, and when the cement would be saturated with matter from the sewage? There are over 6 inches of concrete, and then you have the cement rendering.

9403. But it has been proved that cement rendering will not hold water, even in the best class of buildings? There may be a dampness on the inside of the arch, but I do not think anything would get through.

9404. There would be a soakage into the material, would there not? You would require water to produce the dampness. The sewage matter would not get through. It would be kept out.

9405. Is not cement rendering considered a dangerous material to use upon the inside of hospital walls? No.

9406. Is it not one of the materials which have been rejected by the Board of Health? I do not know why it should be.

9407. Have you noticed from medical reports that cement rendering is a dangerous material to use upon the inside of hospital walls on account of its porosity? No.

9408. When you went to the works at White's Creek and Johnstone's Creek you did not see any arches in course of construction? No; I simply noticed the centerings under them.

9409. In your report you said that this work must be carried on continuously? It is my opinion, from the nature of the work, that it should be done in that way.

9410. Supposing the work at Johnstone's Creek and White's Creek had been constructed arch by arch, leaving joints? The necessity for continuity applies only to a single span. You do not want continuity through the whole work. That applies only to the arch ribs themselves.

9411. What about the dry joints? You must not have dry joints. You must finish your arch right off.

9412. But you must have dry joints if you take the work arch by arch? I do not mean to convey that there is any danger in abutting against the dry work. What I mean is, that you should not stop your arch half way and then go on with the work a day or two afterwards, or even the next day.

9413. In these concrete structures where an arch is used—is it not necessary that the material should be put over the arch, and be rammed through the grid work? You would put down a layer of material. Then you would put the grid on that, and having put on some more material, it would be rammed through and all round the grid.

9414. In your valuation of this work you put down £1 per yard for labour—do you think the labour necessary to put the material in and ram it in would cost £1 a yard even if you included mixing;—is not that estimate excessive? I do not think so. The work has to be done very carefully. You cannot shovel it in like ordinary concrete.

9415. But shovelling it in would cost only a few shillings a yard. Is not £1 a very excessive price? No; I do not think so. Good concrete costs £2 10s. a yard.

9416. But what is the cost of the labour for putting in concrete? My estimate applies only to the arch itself, not to the piers.

9417. What would be the cost of the labour for putting in special concrete per yard? About 5s.

9418. Would not £1 be a very excessive price? I do not think so. It is quite a different thing.

9419. Suppose it had been proved under tests that 7s. is ample to allow for labor, what would you say to that? If you can prove it there is an end of it.

9420. How many men would it take to put a yard in? I should say it would take three men at least.

9421. How many yards would they do in a day;—would they do only one? They would have to put in the whole of the arch in a day.

9422. How many yards would there be in the whole of an arch? I have not taken out the quantities.

9423. There would be considerably more than one? Yes.

9424. When you come to think over the matter, do you not think that you put down an excessive price for labour? I put down a good price, because I saw that the work required great care. I put it down because I saw that you could not trust anyone to ram in the compo. round the net-work. You would have to put on skilled men, and you would have to pay a higher price for the labour. An ordinary labourer for putting in concrete would cost about 8s. a day.

9425. This Monier arch system is a new thing in the Colony;—have we any skilled men here? I take it that you would only put on good men to make these arches.

9426. Supposing the contractors could put on only ordinary men used to compo. and concrete, since we have no specialists here? The men may not be specialists, but you can train them to the work. The work must be done by men who have been trained to it.

9427. But what opportunity has there been of training the men to the work up to the present time? Several of the arches have been built, and if you have one or two trained men they could train others.

9428. You are referring to training which may have been done upon this particular work? Yes.

9429. Supposing the Monier arch is 82 ft. from centre to centre and that the span in the Departmental plan for the brick, stone, and concrete, arch is 52 ft.—supposing also that the 52-foot arch is 18 in. thick, and that the 82-foot span is only 14 in. thick, what would you deduce from that? In my tables I always have the same span.

9430. What was the thickness of the arches you used in your tests? I have not tested any arches. I have tested only slabs. I have tested ordinary compo. slabs with netting and without netting.

9431. You did not test a Monier arch to breaking point to see what it would stand? No, but I read of the tests made by the Austrian society. They made tests with concrete, brick, and Monier, arches.

9432. The tests you made were made with only flat slabs? Yes; I have not tested a Monier arch. I gave you my own tests and the tests of the Austrian Society of Engineers.

9433. Your own tests would be with flat slabs only? Yes.

9434.

W. H.  
Warren.

17 July, 1896.

9434. As to the use of crushed sandstone, can you tell us of any cement-work of durability made with sand from crushed sandstone? Yes.
9435. Where is it? There is the Cockatoo Dock.
9436. How long has that been built? I do not know exactly, but I know that Mr. McKenzie, in building, would not permit any other sand to be used; and in that case the work would require to be first rate.
9437. Of great thickness? Yes; he had to make a water-tight dam.
9438. It would be work in a great mass, would it not? Compared with this structure, of course it would. It was a water-tight job.
9439. Did you ever wash any sand made out of crushed sandstone? There was no necessity to do so.
9440. You never washed it to see if there was any organic matter or clay in it? No; but I washed the sandstone itself. One of the tests I have is to soak the cube in water for twenty-four hours, and then test it. If there were any clay in it I should then get a bad result.
9441. You are not, then, in a position to say absolutely that there is no clay in the sand? I do not believe there is. That is proved indirectly by the tests I have made.
9442. You cannot state absolutely that there is no clay in it? No, certainly not.
9443. As to the elasticity of cement-work, when the cement is over twelve months old, is there any elasticity in it? Certainly.
9444. How is it that cracks occur so constantly in cement-work, supposing you have no iron grid in it; can you tell us of one instance in this Colony where cement-work has been reliable for any distance;—can you tell us of any space of 10 to 13 feet of concrete or cement work which has stood without cracking? Yes; the southern section of the sewerage works is a case in point.
9445. To what work are you referring now? To the outfall sewer at Botany.
9446. Is it standing well? There are hair-cracks, but you have to look for them closely. It is perfectly elastic. The work is thoroughly good.
9447. Do you know that after rain the water percolates clean through this sewer at the sewage farm outfall—have you been there? Yes.
9448. Have you been there after rainy weather? I have been there, but I did not notice the percolation you describe.
9449. Did you not notice what a shower-bath you got under the arch from the weeping of the cement underneath? I never noticed that.
9450. You said, in reply to Mr. Gummow, that the work was being carried out while you were at Johnstone's Creek and White's Creek;—when did you see that work first? I saw it this week.
9451. That is the only time you have seen it? Yes.
9452. It is pretty well completed, is it not? Unfortunately for me, the arches are pretty well complete; so that I was unable to see them in progress.
9453. Then you could not tell whether the work was being well done or not? I could not tell whether the arches were being well done or not; but they have been standing for some time I presume, and if the work had not been well done there would have been some signs of cracking. I looked along the work and tried to find some defects in it, but I failed to do so.
9454. *His Honor.*] Are the arches at both White's Creek and Johnstone's Creek finished? There are some to go in yet, I think.
9455. *Mr. Parkes.*] If you look at the section of the carrier upon the Monier plan, you will see that it is only  $4\frac{1}{2}$  inches over all at the side? Yes.
9456. Look also at the section of the carrier in the departmental plan;—if they were practically the same price, which would be the best to build? I do not know that there would be very much in the comparison. It must be borne in mind that you have a rendering of cement on the inside of the carrier, and that you have also the network in the carrier.
9457. But which is the more solid construction? The other has more material in it, but I think the Monier construction would answer the purpose.
9458. But the departmental plan is the better of the two, is it not? I would not say that. It contains more concrete.
9459. But is it not the more substantial? It is, if you measure it in the mass; but I do not say that with regard to strength. There is a good deal more strength in the Monier construction than you would infer from its dimensions.
9460. But would not the solidity of the departmental plan make it preferable? You are assuming, because it has more stuff in it, that it is necessarily the better or more substantial plan of construction.
9461. Supposing the departmental plan provided for special bluestone concrete with double-pressed bricks; leaving the Monier grid out, and having regard to the question of leakage and soakage and so forth, which would be the better structure? The carrier in the departmental plan is of course the larger, but I do not know that it is so preferable. If you are dealing merely with the question of water-tightness you have the same cement rendering in each case; and, so far as the water-tightness is concerned, you depend entirely upon that.
9462. But would not the greater thickness of material come in? Not beyond a certain thickness. You want a certain thickness, of course, to support the cement rendering, but beyond that I do not think there would be any difference in permeability. Of course, water would get through concrete fast enough—we know that—but then you have the rendering in each case.
9463. But take the whole side of the carrier—18 inches in one case as against  $4\frac{1}{2}$  inches in the other? If you were depending upon the thickness of concrete without cement rendering, of course the 18-inch carrier would be better than the  $4\frac{1}{2}$ -inch carrier; but with cement rendering in each case, I do not think you could show from tests that more water would get through one than through the other.
9464. But is not the thickness, in the case of the departmental plan, an additional safeguard against soakage;—with the cement rendering added is it not preferable? I could not say definitely that it would be. You depend upon the cement rendering, with, of course, a sufficient backing of concrete behind it. If you had a double thickness of concrete in the one case you do not make the carrier any the more water-tight. Whatever will get through the cement rendering in the one case will get through in the other. The greater thickness of concrete in the one case will certainly not make the carrier any more watertight.
9465. With only  $4\frac{1}{2}$  inches at the side in the case of one carrier, would you not consider it a source of danger in hot weather? In what way?

W. H.  
Warren.  
17 July, 1896.

9466. Well, having regard to shrinkage, and allowing for cracking caused by heat outside with comparative coolness inside? The sewage would be rather above the temperature of ordinary water. Even if you had the side thicker, it would be just as likely to crack under the conditions to which you refer.

9467. But is not that a source of danger in a construction of this sort;—would not a brick lining be preferable when you come to consider the changes of temperature? I do not think so. A brick lining would be safe, but on the other hand I could not say that this structure would be faulty because it had only  $4\frac{1}{2}$  inches of thickness at the side of the carrier.

9468. The whole of the constructions to which you refer in your report are latter day constructions? Some of them would be. I forget the exact date of the Austrian cases, but I suppose the structures would average from five to ten years old.

9469. The Monier patent was invented only in 1888 was it not? I think the date is given in the American Society's journal. The Monier system of course has been lately more used than either of the other systems to which I have referred. Upon page 439 of the journal of the American Society of Civil Engineers, you will find these words in reference to Monier—"The man to whom the invention is generally attributed is Jean Monier. He lived, at the beginning of his peculiar career (1876), near Paris, and was in the gardening business. His intention was to build large and strong tree pots, as they are much used there. Monier used for this purpose concrete with embedded wire nets, and invented the so-called Monier system. . . . We first hear of him when he received a first-class diploma of honor at the Exposition in Paris, in 1878, and in a comparatively short time he built nearly a thousand water and gas tanks throughout France, some of them 70 ft. in diameter and 11 ft. high. The next application of this system was to tubes and sewers, then came vaults and bridges, and finally flat floors.

9470. None of these systems have had a great deal of tests applied to them having regard to the life of the structures in which they are used, which is supposed to be from 100 to 200 years? That is so.

9471. None of them have had a greater test than ten years at the outside? That is a fair way of putting it so far as the special combination of iron and concrete in arches, known as the Monier system, is concerned.

9472. It would not have had more than a five years' test? No.

9473. To a certain extent it has been a risky construction;—there have been failures, and those failures have been reported? Yes; there was one failure with the Monier arch.

9474. But they have all been reported, have they not? I presume so. In the case to which I refer, it was perfectly clear why the failure took place.

9475. I mean in the case of bridges? I am referring now to an arch. I never knew of a bridge constructed on the Monier system failing, although a great many have been built.

9476. Is it not rather too early for anyone to have gained proper experience? I would not say that. If a system of construction be sound, we must make a start to use it at some time. It is of no use waiting for 20 or 30 years before you prove a certain thing to be right. If we did that, we should never get on at all.

9477. When did you receive the pamphlet from which you have been quoting? It is dated April, 1894.

9478. Did you know of the Monier system before that date? No; I did not know much about it before then.

9479. Had you ever heard of it before then? I have heard of it as one hears of many things, but I had never investigated it before.

9480. *Mr. Hickson.*] As to the porosity of rendering, Mr. Parkes mentioned the Potts' Hill reservoir—that is the case of an excavation with poor concrete on the face? I know the size of it, and knowing that, I am certain that no one would think of going to the expense of lining it with water-tight concrete. I should not expect it to be water-tight.

9480½. It is an earth reservoir with a puddle wall and concrete facing? The concrete, I suppose, would be like the concrete in ordinary reservoirs.

9481. Do you know if it is made out of cement or lime? I do not know.

9482. Have you examined the pipe-head basin at Potts' Hill? No; I never saw that.

9483. Then you do not know whether it is watertight or not? No.

9484. Do you know the Botany sewer, where it leaves the Botany Road, going down towards Botany? Yes; I have been over it a great many times.

9485. Do you remember the point where it crosses the water-channel? Yes.

9486. Do you remember what the construction of that sewer was? Yes; it is two rings of brickwork, and there is a single brickwork lining, backed with concrete and rendered inside and outside.

9487. Is there any leakage from that into the creek? I never noticed it.

9488. Do you know the Bondi sewer, where it crosses the head of Double Bay Valley? Yes.

9489. Have you noticed any leakage there? I have examined it very carefully. I have been over it again and again, and I have never seen any leakage.

9490. Do you know whether it is not a fact that sewage makes a scum upon all rendering work, and if there be any tendency to porosity, does away with it to a great extent? I never heard of it destroying the coating of cement in such a way as to render it permeable.

9491. With regard to the Monier patent, you were asked if similar constructions had been used in the Colony; let me refer you to the evidence of Mr. John Young at Question 6072;—is the work which he describes there anything like the Monier system? No; it is more like the use of hoop-iron in brick walls.

9492. So that it would be absurd to attempt a comparison between that work and the Monier system? Yes; hoop-iron could not be taken to be equivalent to the special wire-netting used in the Monier system.

9493. You know that iron rails are constantly put into concrete? Yes.

9494. But that is quite a different principle from what is known as the Monier principle? Yes it is. It is, however, from experiments of that kind that we have come to know that concrete preserves the iron.

9495. *His Honor.*] The Monier system distinctly recognises the proper position for putting in and distributing the tensile strength? Yes; it puts the grid where the tensile stress would be developed.

9496. It is of practically no use as a compression member;—it would be thrown away as far as that is concerned? Yes.

9497. *Mr. Parkes.*] Would it not be infinitely better to carry upon these aqueducts pipes of iron instead of this cement structure? It would probably, if you buried the iron in concrete; but the iron exposed would not be as permanent a structure as the Monier system. I should say that the Monier system would last longer. Of course, if you line the pipe with concrete or cement, you protect it.

9498. *Mr. Hickson.*] But the cost of that description of work puts it out of the question at once? Presumably.

9499. Regarding the question of cement which is used here, I think Mr. Bagge said that in all these Monier structures which were built on the continent special cement, under State supervision, was used;—do you think we could get as good cement here as could be got in England or on the continent? You would get the same. I have used the Germania cement largely in my tests, and that is a German cement.

9500. And our tests here are as severe as are the tests in any part of the world? They are practically identical.

9501. In many cases they are more severe, because you use the hot bath as well as the cold water? Yes.

9502. That is not commonly done in England? No. It has been introduced in America, and has been used lately in Germany.

9503. So that the tests to which cement is subjected here are as severe as they are in any part of the world? Yes.

9504. And the cement used in our structures is as good as can be got in any part of the world? Yes.

9505. *His Honor.*] Can you speak as to the evenness of quality of the cement turned out by established manufacturers in England;—Mr. Bagge said that the imported cement from England was not even, and he argued from that that the testing could not be satisfactory? You test from a shipment, and, of course, your results apply to that shipment. You may get a brand of cement, just as you get brands of other things, which may vary slightly, but the variation would not be very great. In some cases brands have been condemned which at other times have been passed. One shipment may be worse than another. I suppose it would be due to more carelessness in manufacture. The manufacturers find that they can sell the article they make in the first instance, and they subsequently take less care, the consequence being that the cement is condemned.

9506. I suppose the statement that the cement passed in Germany is the only cement which can be relied upon is scarcely reliable? That is nonsense. I am thoroughly acquainted with the nature of the tests applied in Germany. I spent a good many days consulting with the principal men connected with these tests—Professor Tetmejer, at Zurich; Martens, at Berlin. I took special care to look into the cement testing, to see if I could pick up anything, but I found no difference between their cement tests and ours. The tests are exactly the same.

9507. You think that cement which is tested out of Germany, then, can be fairly relied upon? Yes.

9508. *Mr. Gummow.*] You mentioned the Cockatoo Dock;—can you tell me of any other large dock upon which sand from crushed sandstone has been used? No. I just happened to remember the Cockatoo Graving Dock. I think that is a very good example on account of the difficulty of getting good work in a case of that kind.

9509. Do you know whether it was used in the case of the Sydney Town Hall or not? I am not absolutely certain.

9510. Could you get as good sand from soft as from hard sandstone, if the stone were crushed down to its natural particles? You might do so. The durability of sandstone depends not so much upon the composition of the grains composing the sandstone as upon the cementing material which unites the grains.

9511. The particles may be as strong in soft sandstone as in hard sandstone? Quite so.

9512. With regard to cement rendering, do you not consider that the trowelling put into it has a great deal to do with its strength and impermeability? The same thing applies to concrete generally. You may get bad or good results as you neglect or observe simple precautions.

9513. If the material used in the  $4\frac{1}{2}$ -in. thickness of carrier is superior to the material used in the thickness of carrier in the original design, would it not make it more impermeable? Impermeability depends entirely upon the cement rendering. If the rendering were better in one case than the other I should prefer that construction. If, for instance, it were better in the Monier design than in the other, I should prefer the Monier design.

9514. Suppose there was not cement rendering, but the material used in the  $4\frac{1}{4}$  inches of thickness were superior to, material used in the 18 inches of thickness? It depends upon how much better the material is. It is impossible to give a direct answer to the question because it is rather difficult to determine how much better the material is in one case than in the other. If the material were alike in both instances of course you would have a better chance with the greater thickness.

9515. Did you understand from Mr. Parkes' question that the sand used in the arches at White's Creek and Johnstone's Creek came out of the tunneling and open-cutting there? I do not understand that. I understood that Mr. Parkes wished me to give evidence as to certain kinds of crushed sandstone.

9516. *His Honor.*] I suppose you have never made a special examination of the structure of the Sydney sandstone in relation to colour and hardness—I mean by breaking up the different kinds of stone and treating them chemically? I have tested them with regard to the quantity of water they will absorb and the effect of acids upon them.

9517. Can you express an opinion as to the components of the different sandstones distinguished by colour and by hardness. Take, for instance, the hard white crystalline sandstone, and then the red, and brown, the softer sandstones? The harder qualities are better for crushing strength.

9518. There is more pure silica? Yes; but the question you have asked me goes beyond what I have done. You would require to have a chemical analysis made of each sandstone, and a subsequent examination under a microscope, before your question could be satisfactorily answered.

9519. Where the sandstone gradually changes its colour as it approaches the surface, and becomes softer, it is due to a change in the chemical condition of the iron which it contains? Yes.

9520. From the silicate or carbonate, I suppose, to red oxide? Yes; that, of course, would account for the difference in colour.

9521. The silicates decompose when exposed to the air? Yes; you will find the same process in the felspar of granite.

9522. As to the contained alumina or the hardness of the crystals into which the stone can be ultimately broken, you cannot say very much? No. It may be that stone, which would be bad stone to use for building purposes, might produce very good sand for testing purposes or for the making of compo.

W. H.  
Warren.  
17 July, 1896.

Joseph Davis recalled and further examined :—

J. Davis.  
17 July, 1896.

9522½. *Mr. Parkes.*] Will you refer to the papers in reference to Contract No. 79 which appear upon page 305 of the Parliamentary papers ;—I want you to read your minute, which appears on that page? Yes, it is as follows :—

Sydney, 19 May, 1892.

THE tunnels from some of the shafts on this contract will be commenced in a few days, and it is, therefore, necessary that it should be settled how they are to be driven, whether with 4-inch charges of compressed powder, 2-inch charges, or without blasting.

With a view of arriving at the method which would give the least annoyance to the residents in the vicinity of the sewer, consistent with economy, I have made comparative estimates.

The excavation by "guttering and gadding" will cost 3s. per cubic yard more than with 4-inch charges of compressed powder, but, as it is impossible to drive the tunnel by blasting to the exact size desired, considerably more concrete has to be used in lining when the driving is done by blasting than when done by "guttering and gadding"; and, taking this into consideration, I estimate it will cost about £1,250 less to do the tunnels without blasting compared with doing it with 4 inches of powder.

The 2-inch charges, with the extra supervision that would be required, would be the most costly of any.

I wish, however, to point out that while it would save annoyance and money to drive the tunnels without explosives, it would take longer to do the work.

9523. Does that mean that there would be an extra of £1,250? In what connection?

9524. I mean an extra upon the contract by reason of the substitution ;—would there be £1,250 more or less cost? What I say in my minute is, that if we adopt guttering and gadding, taking all things into consideration, the work will cost less in the tunnel by £1,250.

9525. *His Honor.*] In other words, that the guttering and gadding would save £1,250? Yes.

9526. *Mr. Parkes.*] The guttering and gadding being 63s. and the blasting 60s., there would be £1,250 extra ;—is that it? There would be £1,250 saved if the tunnel were driven by guttering and gadding.

9527. If the work were done by blasting there would be £1,250 more to pay? Yes.

9528. *Mr. Bagge* in his minute says : "Messrs. Carter & Co. have undoubtedly fixed their schedule prices speculatively to increase their profits on the contract as much as possible, and, if so, to the loss of the Department. Mr. Davis seems, therefore, justified in the suggestions made, as they would likely cause a saving of £1,000, and clause 55 of the specification is no doubt a saving clause against speculative prices."—He quite misunderstood your letter, evidently? No. What he said was thoroughly in keeping with it.

9529. He thinks you mean there would be a saving of £1,000, whereas you mean that it would cost £1,250 more? He thinks I mean just what I did mean.

9530. *Mr. Hickson* afterwards wrote this :—

While I think the Department would hardly be justified in adopting this unusual method of carrying out the work, it is very clear we should aim at getting our work done as economically as possible. Blasting may, therefore, be allowed on the understanding that the average allowance of 4 inches for concrete packing over and above specified size of tunnels be reduced to 2 inches.

That is thoroughly in accord with the two previous minutes. *Mr. Hickson*, on 23rd May, 1892, asked the contractors to call upon him. It is evident that the contractors saw him ; in fact I know that that is so. Between the 23rd of May, 1892, and the 26th May, the contractors called upon him and saw him in my presence.

9531. What took place? The contractors pointed out that if my recommendation were carried out the contract would not be completed under three times the contract time—that is to say, that it would take three times as long to drive a tunnel by means of guttering and gadding as by blasting. While they saw the force of what I had written from the departmental point of view, at the same time they wanted to get the concession of doing the excavation by means of blasting. To get over my difficulty they said they were prepared to allow for the concrete lining a sum equal to £1,250, which would mean the 2 inches referred to by *Mr. Hickson* ; and that being so it was to our advantage to let the work be carried out by blasting, as we should have done under ordinary circumstances. In this case, however, as I point out in my minute, in consequences of the prices—that is the way in which the contractors had fixed their prices—I considered it my duty to call attention to the matter.

9532. What was the urgency in connection with this contract ;—was the outlet built? The outlet was not built, but the urgency in connection with this contract was this—I am glad of an opportunity to explain it because the witness *Gilliver* rather threw out a suggestion which reflected to some extent upon the management of the Sewerage Branch—the urgency in connection with Contract 79 was simply this : The people of North Sydney required the sewerage at the earliest possible moment, and already an order had been made to give a little relief ; to that end a large quantity of reticulation was carried out before this contract was let. It was known before the contract was let that it would probably take two years to put down the shafts, drive the tunnel, and complete the work. It was thought when this contract had been under weigh for a matter of twelve months or so that everything would be ready for the letting of the outfall works at Long Bay, and that those outfall works would be finished simultaneously with the works on the main sewer. But after the contract was let and during its progress the Government, for its own reasons—and I know they were sufficient reasons—was not able to go on with sewerage work ; and that threw out the whole calculations of the office. Consequently Contract 79, which had been entered into, had to be finished, whereas the outfall works were not commenced.

9533. That does not get over the question of urgency. There was no absolute urgency in the matter? Yes. With the knowledge that we had at the time Contract 79 was let I am in a position to say that there was absolute urgency. As matters turned out—matters that we could not foresee—there was no urgency.

9534. During the course of the contract did the urgency cease? The urgency existed, but at the same time the Government were not able to go on with sewerage works. Consequently this large expenditure at North Shore is lying idle at the present day.

9535. *His Honor.*] You mean to say there was a difficulty in raising the wind? That is what it amounts to, and it was a matter over which the sewerage office had no control whatever.

9536. *Mr. Parkes.*] What was the office estimate for the excavation by blasting ; it does not appear to be included in these papers? I could not tell you.

9537. Will you furnish the Commission with the estimate that you made at the time? If it is among the papers, certainly.

9538.

9538. Is it a fact that when this contract was three-quarters of the way through you wrote a minute drawing the attention of the Engineer-in-Chief to the fact that, since the bulk of the profit was on the first items of the contract, the contractors might at any time cease, and that in that case the country might lose some thousands of pounds? I do not remember that minute. I know that the profit was high in the excavation of the shafts. J. Davis.  
17 July, 1896.
9539. In the shafts and the tunnelling? In the shafts, principally; and I know why it was put in. The contractors had to provide a most expensive plant, the shafts being deep.
9540. Did you not write a minute pointing out to the Engineer-in-Chief, when the the contract was three-quarters of the way through, that the work might at any time cease and leave the Government at a loss of thousands of pounds? I do not remember it.
- 9540½. Did you ever make a report to that effect? It is impossible for me to remember every report I write.
9541. Please tax your memory;—this report would be rather an important event, would it not? I do not remember a report of the kind, nor do I know under what circumstances I should be likely to write such a report.
9542. Is it not a fact that the contract did turn out in such a fashion that the profits were very great in the first portion of it—the excavation work? No; I should say that the profits were very great in the shafts, but I should not say that they were small upon other parts of the work.
9543. You are sure you did not write a minute to the effect I have named? I am not sure of it, but I have no recollection of it.
9544. Do you generally keep all the papers relating to a contract in one portfolio? All registered papers would go to records. A few scraps of paper which passed between myself and the inspector, which were not considered worth registration, were kept in my own office for reference when I required them.
9545. Every minute is registered, I presume? All the letters are copied into my letter-book. Every letter I ever wrote was copied into that book, and all the minutes I wrote would be copied there also.
9546. You have the letter-books and the registers of letters and minutes, I suppose? I believe so.
9547. They can be obtained? There might be a little difficulty in finding some of them, because, as has already been pointed out to the Commission, there have been several moves within the last three or four years. Some of the records were put in a room which took fire some eighteen months ago.
9548. Were any of your letters burnt then? I am not sure. Mr. Hungerford will be able to say precisely; but I know that a large quantity of old records would be there.
9549. Had you at any time to act severely with Reid, Carter, Gummow, & Co.'s manager? I had.
9550. On several occasions? On two or three occasions while he was at North Shore I had to take serious exception to his conduct.
9551. Upon the report of your inspector? He reported the matter to me and I went and investigated it.
9552. You found that he had been scamping cement work? I did not find anything of the kind. What was complained of was this—that he did not treat the inspector as courteously as he might have done; in some cases I think he went altogether beyond the bounds of propriety.
9553. What was the inspector doing to him when he treated him improperly? I assume that he was doing his duty.
9554. Was there not one instance where he was caught putting down dry metal without any cement—I mean the case which Wagg reported? He was not putting down dry metal in that case.
9555. You reprimanded him severely, did you not? Yes, because he wanted to put down as filling, at the back of the brickwork in a shaft, larger stones than should have been put down.
9556. Without cement? It was not a question of cement. It was a question of filling. The brickwork in the shaft had been built. It was a small shaft inside an excavation 6 by 5, I think, and the back of the brickwork had to be filled in with ordinary filling. As far as I remember, Inspector Wagg was not satisfied with the way this material was being put down the shaft, and Reid was saucy about it.
9557. Did not all the inspectors complain of this man? I do not think any of them but Inspector Reid and Inspector Wagg complained.
9558. Are you sure that a great number of other inspectors upon other jobs had not complained of him? Certainly not upon Contract 79. That was the first occasion upon which I had had any complaint made to me as to his conduct.
9559. Did you demand his removal? No.
9560. Why did you not do so—is it not a rule of the office that a contractor's manager shall be removed if he impedes the work? If there be sufficient cause for his removal.
9561. Was not there sufficient cause shown in Inspector Wagg's report? No.
9562. Did he not say that Reid always intimidated the inspectors? Not to my recollection. I found that it was not a case for removal. I saw the contractors about the matter, and I found that they had already reprimanded Reid. They promised me that nothing of the kind should occur again, and that they would see that the work was carried out according to specification.
9563. *Mr. Hickson.*] The meaning of the minute to which Mr. Parkes has referred upon page 305 is that we got the work done in a much shorter time, and at no extra cost? That is so. The work was done in a third of the time as far as the excavation was concerned, certainly.
9564. As to the urgency, so far as the sewerage branch is concerned, it existed then and it exists still;—it was really a question of money; the Treasury could not give us money to go on at the rate at which we had expected? No. They did not supply us with funds with which to carry out the arrangements we had in our minds. Our idea was to get the works finished simultaneously with the outfall works so that there might be no works lying idle without bringing in any revenue.
9565. That upset our arrangements generally throughout the sewerage works? Yes. The same thing occurred in the western suburbs. We spent large sums of money there, and the works brought in no revenue.
9566. We had arrangements made for commencing at the outfall and working inward so as to embrace the various areas of sewerage as the work proceeded? Yes. The disposal work was to be finished at the same time as the upper portion of the sewerage was finished.
9567. And that was the arrangement made in respect to No. 79 Contract when this minute was written? Yes.
9568. Do you remember Mr. Wagg's evidence in regard to defective work? I do not regard this filling as defective work. It was a matter of opinion as to whether the size of stone which was being put down should be put into the filling or not. 9569.

- J. Davis. 9569. It was not a question of concrete; it was a question of whether the stones were too big to go down into the filling? Yes; it was more a matter of taste than anything else.
- 17 July, 1896. 9570. *His Honor.*] Would it alter the interstices? It could not do that, because there was a sufficient quantity of small stuff to fill up all the interstices. What Inspector Wagg was afraid of was that as the stones descended they might damage the brickwork.
9571. *Mr. Gummow.*] You said that the contractors called to see Mr. Hickson upon the strength of the minute you had written upon the question of guttering and gadding? Yes; they called to see him between the 23rd and the 26th, I think.
9572. Do you remember whether anything was said at that time as to the injurious effects of guttering and gadding upon the men? Yes, I know that it was.
9573. Was not that put forward as a strong argument by the contractors? Yes; I know that Mr. Carter has a decided opinion as to the effect of that class of work upon the men.
9574. Have you not heard since that time that it is a class of work which has an injurious effect upon the men? Yes; I believe it is not as healthy as powder smoke, bad as that is.
9575. Mr. Parkes suggested that you may have written a minute to the effect that the contractors had the biggest profits in the commencement of that particular contract. Did they finish their work? Yes.
9576. Did they show any signs of throwing it up at any time? No.
9577. *His Honor.*] I want to discover who drew the schedules for these contracts? Mr. Bagge prepared all the schedules and specifications. He made all the estimates for new contracts.
9578. It is in evidence that all through these Sydney sewerage works subducts have, in point of fact, hardly ever been used at all: and I wanted to see whether you could explain how it was that, while the schedules continually provided for subducts in places where subducts might be expected to be used, they were finally not used at all, putting the tenderers in the position of being able to rig their schedules much more conveniently than if subducts had been left out? I admit that. It was a difficulty that occasioned Mr. Bagge and myself serious consideration. We had to provide for all kinds of contingencies in the schedule; and it was impossible to know before the tunnels were driven what kinds of material would have to be excavated—that is to say whether the ground was watercharged or otherwise. Although the probability was that in most instances no subducts would be required, still it was running a risk to leave them out. It is a well known fact to all those who have to do with contractors that if you have to get a price from them after work is let it is a very different price from that which you will get before the work is let; and, having regard to that fact, although we did run the risk to which you refer, still it was too serious a matter to leave it in the hands of the contractors to say after they had got the contract what should be the price for the subducts. That is the reason why a number of things were put into the schedules. They were put in on the off-chance of their being required.
9579. How were the quantities arrived at for the subducts? They were simply guesses.
9580. The best guesses you could make under the circumstances? It was not my guessing; it was Mr. Bagge's guessing entirely. He used his judgment in the matter. I have an instance in my mind in connection with the use of these subducts. In a sewerage contract running along underneath Liverpool-street, a part of the Bondi sewer, the ground was so exceptionally wet—it was all in rock—that subducts had to be put in. The work could not be constructed to the advantage of the contractor without them. He was called upon to make an excavation in the bottom of the tunnel and to insert pipes. I suppose he lost about £1,000 by it. His experience had been gained in an adjoining contract where he found that there were no subducts to be put in, as the ground was dry. He applied that experience to the contract I have spoken of, and he found that he was wrong. He eventually had to pay about £1,000 for the construction of the subducts. The contractors under the old system always speculated in that way. They took advantage of any item, and used their judgment as to whether it would be increased or decreased, and rigged their schedules accordingly. All kinds of means were tried to stop it, but we failed, and we found that the only way was to alter the system. In regard to this question of excavation, we got prices for guttering and gadding without any quantities. We knew that no guttering or gadding would be required, unless under exceptional circumstances. The contractors took advantage of that and put in a large price, and I know as a matter of fact—at least I have a very shrewd idea—that in one case efforts were made to bring pressure to bear upon the department to get the work done by guttering and gadding, so that it might be paid for at a high price. When we found that, leaving out the quantities in the schedule, we were not successful in obtaining a legitimate price for the guttering and gadding, the total excavation was divided into three parts. One third was put opposite to the item for excavation to be done by guttering and gadding, a third opposite to the excavation to be done by means of blasting with 4-in. charges, and a third opposite the excavation to be done by means of blasting with 2-in. charges. But even this was not successful. The prices that the contractors attached were still unsatisfactory. The conclusion which was arrived at was that there was no course open whereby a legitimate price could be obtained for the work except by the office fixing the rate opposite to each item, and requesting the contractors to tender above or below, or at the rates in the schedule.
9581. *Mr. Parkes.*] Is there not a clause in your specification giving you full control over these schedules, so that if you find any trickery going on you can adjust them? That would be a most objectionable course for the department to take. I do not think there is such a clause. (*Vide Appendix No. 36.*)
9582. *Mr. Gummow.*] Had the firm of Gummow & Gillan anything to do with the contract of which you have spoken, in which the contractor tried to get the guttering and gadding? No.
9583. Had Carter & Co. anything to do with it? No.
9584. *Mr. Hickson.*] As regards the question of putting items into schedules which were not required, has it not been found from experience that it is better to put in every item which may arise in connection with the contract? Yes, and for the reasons I have given.

MONDAY, 20 JULY, 1896.

William Scarlett Delisle Roberts :—

- W. S. D. Roberts. 9585. *Mr. Parkes.*] You are cement tester for the Department of Public Works? Yes.
- 20 July, 1896. 9586. Do the contractors themselves apply to the Department to have their cement tested? I do not think they have ever applied; they have no need to apply.
9587. There are parcels of cement brought in to be tested? Samples selected by the Government Inspector. 9588.

W. S. D.  
Roberts.

20 July, 1896.

- 9588 Are the whole of the casks which are tested marked? Those which are in bond. We mark no cement already delivered on the works. That cement is kept, I presume, in the proper sheds upon the works until it has been tested and accepted or rejected.
9589. Is the cement which goes on to the contractors' works tested? All cement used in the work is tested.
9590. Would it be possible for any parcel of cement to go into the work which has not been tested? That is a matter outside my province altogether.
9591. Is not the number of casks required by the contractor to be tested kept in your test-book? The number of casks is recorded according to the inspector's or engineer's report.
9592. When tests are made they are minuted in a book? In the certificate book.
9593. That is what you call your test-book? Yes.
9594. Will you look at 1330? Yes; 600 casks were tested, I see, for Carter, Gummow, & Co., selected at sewerage contract No. 77.
9595. There are two entries of figures representing the number of casks at the top of the page to which you have referred, one in red ink and the other in black ink;—which is the correct number? The black ink should always be the correct number.
9596. What does the red ink number signify;—it does not mean that the whole parcel is over 1,000 casks, does it? No; it means that there is some difference in the information obtained. It means that there is some doubt as to whether the number of casks is 500 or 600.
9597. The parcel is always minuted as you have it there? Yes.
9598. The contract to which the cement goes is always put in this record? Yes; and the names of the contractors are inserted if I have the names in the application.
9599. Otherwise the number of the contract is inserted? Yes.
9600. So that it would be impossible for cement to be sent to a job without appearing in your register if the inspector did his duty? I believe it would be impossible.
9601. You say that if the inspector did his duty it would be impossible? I believe it would be.
9602. Will you turn to the certificate under date 5th December, 1895? Yes; it was a sample of cement selected on 4th December, at contract 118, from a shipment of 1,360 bags.
9603. Was it approved of;—did it pass your test? No; it did not.
9604. Will you now look at certificate No. 1,364? Yes; that is a test of cement selected on 8th January, 1896, from a shipment of 2,000 bags. That was afterwards re-tested.
9605. Will you now turn to certificate No. 1,378? Yes; that is a test of cement selected on 12th February, 1896, at contract 118, from a shipment of 1,500 bags. In that case the twenty-eight days' cold test was a good bit below the minimum. It passed in the other tests.
9606. From that time forward John Try's cement was rejected? I believe that was the last test. I can find no tests after that.
9607. *His Honor.*] But was the cement altogether rejected? As far as I can see from this book it was condemned from that date; but in order to make certain I should prefer to refer to the summary of tests of different brands. Upon referring to that I find that No. 1,378 was the last test made of John Try's cement.
9608. *Mr. Parkes.*] The twenty-eight days' cold sand test is a very important test, is it not? Yes; it is an important point.
9609. From where did the sample come in the case to which you have just referred? It was selected from contract 118.
9610. The cement was out there? It was evidently out there.
9611. What has since become of that cement, do you know? That is not under my control at all.
9612. At one time the contractors used to fetch their samples to the office, did they not? I have not heard of it.
9613. Have the inspectors always brought in the samples? It is the duty of the inspector, or someone he can trust, to bring in the samples.
9614. When a sample has been accepted does the inspector mark every cask in the parcel? That is a matter altogether out of my province.
9315. But is it not the rule of the Department? Not that I am aware of.
9616. Do you not know that the casks are marked? Not on the contract, I think.
9617. But supposing the cement is in bond? In bond the casks are always marked before delivery to the contract.
9618. How are they marked? The brand of the Public Works Department is stamped upon them.
9619. Does the brand denote the contract to which the cement is to be sent? No; it is merely marked showing that it belongs to the public works.
9620. *His Honor.*] Is the brand to which you have referred put on the casks only after the cement has been passed? It is put on after the cement has been passed and before it is delivered.
9621. It indicates that the cask contains passed cement? Yes.
9622. And you say that that is not done in the case of casks on the work? Not on the works, because it can be kept in a store on the works under lock and key.
9623. *Mr. Parkes.*] Is not the key always kept by the inspector? I do not know. That is outside of my work altogether.
9624. As a matter of fact, do you not know it to be a rule of the office for an inspector to keep the key? I should say that someone ought to look after it in some way or other to see that it is not changed.
9625. But is it not a regulation of the office that the inspector shall keep the key? Not that I am aware of.
9626. *Mr. Davis.*] I want you to refer again to No. 1378;—that would indicate that 1,500 bags of cement had been delivered to Carter & Co. at contract No. 118? Yes.
9627. From whom would you get that information? From the person who applied for the test.
9628. You would therefore depend for this information entirely upon the inspector who happens to send in the sample, and the application for the sample to be tested? We depend upon that entirely. It is sometimes rather difficult to obtain exact information. Sometimes I have merely verbal information.
9629. Is it not a fact that I have had repeatedly to complain to inspectors as to the imperfect information which they have supplied when sending in cement for tests? Yes; that is a fact. I myself have mentioned the matter to you.

W. S. D.  
Roberts.  
20 July, 1896.

9630. And in the face of that you would not be prepared to swear that all the information given at the head of these certificates is correct? I can only say that it was given to me as correct.
9631. Your duties are entirely confined to the cement testing-room? Yes.
9632. You have nothing whatever to do with the delivery of cement on the work? No.
9633. You have nothing whatever to do with the selection of samples? No.
9634. You have simply to test the samples which are delivered to you at the testing-room? That is all.
9635. And the information supplied to you by the inspectors, at the time they forward the sample, is copied by you into the book before you? Yes; I have to take it for granted that it is correct. There is one point concerning the page to which Mr. Parkes first referred me which I might mention—that is, as to whether the number of casks would be 500 or 600. I could not say definitely whether there would be 500 or 600 casks, but the fact of one number being in red ink and the other number being in black ink would denote that I had some doubts on the point.
9636. Coming to what you said was rather an important point, that is, the failure to comply with the twenty-eight days' cold test, it has often happened, has it not, that when cement has passed all the other tests but one fairly well, and in the one case has come within a small percentage of the standard required, it has been passed? Yes; it would be hardly right to reject a cement which came within a small percentage of the minimum in one test only and which passed all the other tests.
9637. As to this particular test, you do not know whether the cement was kept and re-tested? I cannot say.
9638. Will you describe the tests you made after receiving a sample from any particular parcel—take, for instance, the gravity test? The specific gravity of cement is put down by most authorities as being, for good cement, over 3. Therefore, we have the minimum of 3 for specific gravity. If it is under that it is supposed not to be good. In this case the specific gravity was 3.028.
9639. *His Honor.*] The cement comes to you in the form of powder? Yes.
9640. How do you take the specific gravity—in what form do you take it? In powder before it is hydrated. It is taken in some fluid which will not harden it, such as oil or kerosene.
9641. Is it poured into a mould, or what is done? It is weighed. We know the specific gravity of the fluid, and we know the volume of the fluid that is put in. We know the weight of the cement in the air, and the weight of the bottle with the fluid and cement, and, knowing that, we can arrive at the specific gravity.
9642. *Mr. Davis.*] Take the carbon dioxide absorbed by three grammes of cement? Yes; if the cement absorbs too much carbon dioxide it is pretty clear proof that it has a large percentage of lime not combined.
9643. *His Honor.*] By carbon dioxide you mean carbonic acid gas? Yes.
9644. What would be the effect of too much uncombined lime in the cement? First of all you have less active material for hardening, because the lime is not combined with the alumina and the silica. Therefore, you do not get the hardening properties which you would otherwise get.
9645. What would be the effect upon the mass in position, supposing there were free lime of the description you speak of? It would mean that in some instances where the concrete is in a place where water would percolate through it the free lime would be washed out. It would be soluble, and the washing out would create spaces within.
9646. *Mr. Davis.*] Take the sifting test, No. 4? That is the weight as received unsifted per imperial struck bushel.
9647. That gives you an idea as to whether the cement is fine or otherwise—it is a confirmatory test for Nos. 5 and 6? Yes. It is a test which is not regarded as of much importance, because in the present day they make cement much finer than they used to, and the fact of its being very fine makes it appear lighter in weight. The minimum is put down at 100 lb. by the imperial struck bushel. Anything under that is not accepted. But supposing it is a fine cement, it might be of far better quality than coarse cement over that weight.
9648. You do not, therefore, regard No. 4 test as being of great importance? No.
9649. Tests Nos. 5 and 6 have to do with the fineness of the cement, and they are of great importance? Yes.
9650. What do you do to ascertain the residue from the cement? It is sifted through different sized sieves. There is a sieve of 6,400 meshes to the square inch, and also a sieve of 14,400 meshes to the square inch. The residue is taken from these sieves; the maximum allowed, in the first instance, being 20 per cent., and in the second 30 per cent.
9651. So that if cement has a residue in the sieve of 6,400 meshes to the square inch equal to anything less than 20 per cent., it will be good cement? It will be moderately good cement as far as the residue is concerned.
9652. In the case of 1378 it is only 8.31 against the maximum of 20 per cent.? Yes.
9653. And in the case of the 14,400 mesh to the square inch sieve, what is it? 12.6 against a maximum of 30 per cent.
9654. How do you make the tension tests? They are made by first mixing the cement with a certain proportion of water and putting it into moulds, and then after the first day immersing it in water for various periods. At the end of these periods the cement is taken out and broken by tension.
9655. You are very careful when you put the briquettes into water after having made them that the water is kept at a fairly uniform temperature? Yes. We have a gas stove for that purpose.
9656. The quantity of water you put into the neat cement briquettes and into the 1 to 3 sand briquettes varies with the fineness and condition of the cement? With the quality of the cement. Some cement requires a great deal of water; other cement a wonderfully small quantity of water.
9657. You have a machine for ascertaining the quantity of water that should be put into briquettes in order to obtain uniform comparative results? The machine is based upon the principle that if cement is kept under a certain pressure under water it will absorb a certain quantity of water. We have a standard pressure of 1,400 lb. to the square inch. The cement is put into a mould and is pressed down, and is allowed to absorb water for two hours. The percentage absorbed is taken as a guide to work upon as to how much water to put with the cement when making the briquettes.
9658. You are in a position to state that the utmost care is exercised in the testing of cement in the Department of Public Works? We take the greatest care we can; in fact, we often have tests completely taken over again in order to satisfy ourselves if we are not thoroughly satisfied in the first instance.
9659. Upon special occasions you make the test extend over many years? Up to five years.

W. S. D.  
Roberts.

20 July, 1896.

9660. You have taken a great interest in the testing of cement for years past? Yes; when I was under Mr. Bennett, he asked me to take the matter in hand and to ascertain whether I could not improve upon the system. I have since done my best to do so.
9661. You are acquainted with all the newest methods adopted in England, on the continent of Europe, and also on the continent of America? Yes; I have obtained the latest information through the various journals.
9662. Is it not the fact that all the newest methods which, in your judgment, and in the judgment of the office, are of any value have been adopted in the cement testing room? I think they have.
9663. If inferior cements were being imported into the Colony and were submitted to you for test, would you be able to discover the inferiority? We should be able to do so.
9664. You are absolutely sure about that? Yes.
9665. You have had experience in other parts of the world in connection with cement? I never had any experience in the testing of cement before I came to New South Wales.
9666. From your experience in the testing of cement since you have been here, and from your reading, should you say that the cements which are used upon the works of the Public Works Department must of necessity be of the best possibly quality? I think our tests are as severe as, if not more severe than, those of any other country.
9667. Quite as severe as those in any of the other Colonies? They are certainly more complete than those in any of the other Colonies.
9668. Is it not a fact that merchants have repeatedly complained to the Minister and to the Engineer-in-Chief of the severity of our tests? Those who do not get their cements passed naturally do complain; but the importers of the best cement do not complain.
9669. Good cement will pass through your tests all right without any trouble? Yes.
9670. Among your tests you have a test of the tensile strength after seven days in Deval's hot bath? Yes.
9671. Is that not considered by importers to be a very severe test? It is considered by some of the importers to be a very severe test. Some of the German manufacturers cannot keep up to it, whereas the English manufacturers generally go above it. They show to advantage in that respect.
9672. Any defect in the cement to which that test would apply would be discovered? It discovers at once the presence of a very small quantity of unslaked lime.
9673. This test would infallibly discover the existence of too great a quantity of unslaked lime? At once.
9674. *His Honor.*] Is cement supposed to contain no anhydrous lime at all? No; the lime is never thoroughly slaked. A small proportion of unslaked lime would not do any harm. The test of absorbing carbon dioxide applies to the slaked lime, and this latter test to the caustic lime.
9675. *Mr. Davis.*] You would not like to say that this book contained a record of all the cement which has been used upon any given contract? I could not tell you. I have no information whatever upon that point.
9676. *Mr. Gummow.*] As to John Try's cement, what is your opinion of it as a cement? My opinion of John Try's cement up till last year was very high. He had taken a great deal of trouble for many years under great difficulties, I believe, in trying to work out the correct theory for making good cement. He succeeded very well in small quantities, and his cement passed a better test than did any other cement which has been manufactured in the Colony—in fact, none of the colonial cements could compete with his in the hot sand test. But since he left the Colony his works seems to have fallen off, and the last few tests were not up to standard. There seems to be a good deal of caustic lime in the cement, and that destroys its quality.
9677. *His Honor.*] When did he leave the Colony? At the end of last year or the beginning of this year.
9678. It was just then that your tests showed his cement to be falling off? Yes.
9679. That would be in December, January, and February? Yes.
9680. *Mr. Gummow.*] Do you not find in new cement a certain quantity of free lime? All cement contains a certain amount of caustic free lime, which should be slaked; but there should not be a large proportion. If the proportion is too large no amount of time will do it any good. Time of course will slake it, but then the cement will never be of proper quality.
9681. Do you not find that, by keeping cement which has a little too much free lime at first, the cement is afterwards benefited? The fact of keeping it would benefit a cement with a small proportion of caustic lime. Almost every cement has a small proportion of it. Therefore it is not advisable to use it fresh from the kiln.
9682. A good deal of cement that contains lime gets hydrated in coming from Europe? To a certain degree.
9683. Have you made any tests with regard to the porosity of cement? I have come to the conclusion, after a good many tests, that the porosity of cement in itself varies very little. Good cement, when mixed with sand, varies only according to the quality and proportion of the sand.
9684. What would 1 to 1 mortar stand without letting any quantity of water through? A 1 to 1 mortar ought to be practically impervious after a given time.
9685. Under what head of water? I have not tried it with a great head; the greatest head I have had has been 6 feet.
9686. And you find it impervious with a head of 6 feet? It is pervious at first until the cement has time to thoroughly harden.
9687. *His Honor.*] How long would you give it? One month at least.
9688. *Mr. Parkes.*] When the figures given as to the number of casks are doubtful, you mark them in red ink in your test-book? In the case to which you referred I marked the figures in red ink because the number was doubtful.
9689. Are there not other cases where you have marked the figures in red ink when they have been doubtful? I have sometimes done so.
9690. As a matter of fact the most important test in the case of cement has reference of its durability, as to whether it will stand for any number of years? Of course cement-work has to be durable. Consequently that is a most important point.
9691. You have looked up your record of the tests of John Try's cement, and you find that the test to which you referred this morning was the last test of that cement you made? Yes.

9692.

W. S. D.  
Roberts.  
20 July, 1896.

9692. What is the falling off in the test in the twenty-eight day's cold water bath? There is not a falling off at all in the twenty-eight days. It increases to 168 lb.
9693. But what is the standard? Two hundred pounds.
9694. *His Honor.*] You are referring now to the tensile strength? Yes.
9695. That is a square inch section? Yes.
9696. *Mr. Parkes.*] Have you any compression tests? No.
9697. With regard to the porosity of the cement, how many tests have you made;—did you make many tests or only one? It is some years ago now. I made a great many.
9698. With what cement? With various qualities of cement.
9699. Did you make the tests in a bath, or what method did you adopt? We had an apparatus specially designed for making the test.
9700. In all the tests you made did no water get through? Did the cement itself keep the water from going through in all the tests? The neat cement was impervious after a given period.
9701. And when mixed with sand, what results did you get? That would depend entirely upon the quality of the cement and the sand. 1 to 1 mortar would be after a time impervious.
9702. Would there be no appearance of moisture on the underside of the disc? For a certain time, but it would afterwards be dry.
9703. In all the tests you made with the 1 to 1 mortar were you successful? I cannot say without referring to them. They were made a long time ago. I know we found that neat cement was perfectly impervious after a certain time.
9704. *His Honor.*] What is the twenty-eight days' test you have spoken of—the test under which the sample of John Try's cement failed? It is the tensional strength after twenty-eight days in cold water.
9705. When you are testing a lot of cement I suppose you cannot wait more than a certain time, and twenty-eight days is your limit? Yes.
9706. Then, if you reject the cement upon the ground of the tensional strength being under the standard, after twenty-eight days, do you continue the test so that you may be in a position to tell what the tensional strength is after a longer period has elapsed? We often keep the cement for a longer period. We make up some of our tests to five years. We can get results at any time. They are recorded after twenty-eight days for reference. The twenty-eight days' test is considered the final test.
9707. In the case of this particular cement the tensile strength after three months was 258 lb.? Yes.
9708. What is the minimum standard required after three months? 275 lb.
9709. In point of fact, then, this cement has never passed the testing-room as far as tensile strength is concerned? No, it has not passed the test as far as tensile strength is concerned.
9710. If it did stand the test after a further lapse of time—that is, if the tensile strength increased to your standard—would you then pass the cement if everything else were right? It would be hardly fair to deal with it in that way, because in the meantime the cement might have deteriorated. You would require to test it again to find out that it had not deteriorated.
9711. In what respect would it deteriorate? Cement is rather an unstable compound. If it be kept exposed to the air in any way it generally decomposes. Some cement will decompose much faster than others.
9712. What chemical change takes place? It decomposes.
9713. That applies to the lime, of course, but to what other parts;—I thought that the principle of cement was that it was all in an uncombined state;—is it really decomposition or combination which goes on? I am referring to unhydrated cement in a state of powder. In that case decomposition would go on.
9714. But what is the decomposition;—what are the component parts of the cement? The principal components are a double silicate of lime and alumina, silicate of lime, aluminates of lime, and ferrite. Some of these are feeble compounds, and some are more stable compounds. The feeble compounds would be liable to decompose from exposure to the air.
9715. It is the lime compounds that decompose by the action of the carbon dioxide? That is the main reason, combined with a certain amount of dampness, of course.
9716. All changes which take place after setting are, in the case of good cement, favourable and strengthening? Yes; the strength increases by hydration and crystallisation.
9717. That is all in favour of the stability of the cement? Yes.
9718. *Mr. Davis.*] As to the 28 days' test—is it not a fact that the exigencies of work often make it necessary to decide whether cement is to be accepted or rejected upon a 7 days' test? A few years ago it was always accepted or rejected upon a 7 days' test. Twenty-eight days was considered too long a period to wait.
9719. It is difficult for contractors to make arrangements to keep a sufficient stock upon the works to permit of their waiting for a 28 days' test? Yes.
9720. As a matter of fact, you yourself do not pass or reject cement; that is left to the Engineer-in-Chief? Yes.
9721. Your part of the business is simply to make the tests and record the results? Yes.
9722. *His Honor.*] And to report? Yes; to report on the facts.
9723. To the Engineer-in-Chief? Yes.
9724. *Mr. Davis.*] As to the doubt in your mind as indicated by the two sets of figures at the head of some of these certificates, one in red ink and the other in black ink;—when you put in the red figures, I presume you would hear from someone that there was a doubt as to the number of bags or casks in the parcel? Yes.
9725. There might have been uncertainty in connection with other tests without your hearing anything about it? Yes.
9726. *Mr. Parkes.*] Who gives you these returns? The information for the tests is conveyed to me upon paper through the proper course.
9727. What is that course? It is to send in an application for a test.
9728. How would that be sent? Through the Engineer in charge of the contract.
9729. To whom does he send it? He sends it either to me or to the Engineer in charge of the office.
9730. Who would that be? In the present instance, Mr. Carlton.
9731. In former instances, who would it be? Mr. Davis.
9732. *Mr. Gummow.*] With regard to the sands;—you have tested the Nepean sand, crushed sandstone, and the Surrey Hills sand? Yes, sand from most of the districts round about Sydney. 9733.

9733. Do you remember testing any crushed sandstone that came from the Gas Company's quarry at North Shore? Yes; I think I made two or three, or perhaps four, tests of that sandstone.

9733½. Have you made any other tests of crushed sandstone? Yes; I think in connection with Contract No. 118.

9734. In connection with any others? Yes, various contracts.

9735. What opinion have you arrived at as to the strength and value of crushed sandstone for sand? We arrived at the result that some of the crushed sandstone was very good sand to use with cement on account of the uneven size of the grain permitting it to take up space which would not otherwise be filled up by sand. Owing to the uneven size of the grains, a certain quantity of superfluous cement would not be required to fill up the spaces.

9736. *Mr. Parkes.*] In other words, you say that fine sand would take the place of cement? It would to fill up the voids, but the cement gets around each particle of sand as well, and the whole mass would be just as solid as it would otherwise be.

9737. *His Honor.*] The particles you would find in cement would be infinitely smaller than the average grains of sand? Infinitely. It is following out the principle which is used in all concrete—that is, to take certain sized stones and to mix them often with material of smaller quality and then with sand and cement, the whole of the material being afterwards cemented together in a solid mass. The more uneven the aggregate is the less cement would be required to do the same amount of work.

9738. *Mr. Gummow.*] As regards strength, did not some of the results you obtained from crushed sandstone exceed your standard? In some cases we got high results.

9739. Have you found that in a number of cases the crushed sandstone has given higher results than has the Nepean sand? In some cases it has been found to give perceptibly higher results than has the Nepean sand, and for the very reason that the cement required to fill up the voids is not so much as would be required with an even sized grain of sand. You fill up the voids with small grains of sand and stone and you get a greater strength.

9740. *His Honor.*] The addition of the cement to the sand does not increase the original bulk of the sand? It should not increase the bulk much. In all instances it does increase it a little.

9741. Does the bulk diminish as you go on mixing dry? I am speaking now of mixing wet.

9742. Do you not mix dry before you mix wet? Yes; we mix dry at first.

9743. Is not that one important element in the matter—thorough dry mixing before wet mixing? I do not think it is very important, because the material cannot be thoroughly mixed when dry.

9744. It is only after the wetting, you say, that thorough mixing takes place? The mixing after wetting is most important, because the cement then adheres to every particle of sand that is turned over.

9745. *Mr. Gummow.*] You have seen different qualities of Nepean sand? There are at least two qualities of it—some is fine and some is coarse.

9746. Have you ever received these two qualities for test? Yes.

9747. Upon contracts? I cannot recollect now where they came from.

9748. Have you ever had any occasion to condemn Nepean sand;—have you ever found that it did not go up to the standard? I do not remember that; Nepean sand I have found to be one of the best sands.

9749. Have you ever tested sandstone crushed by a rock breaking crusher? Yes; I have tested crushed sandstone which I have been told has been crushed.

9750. Was it of a very fine description, like powder? I cannot recollect these points now; I made the test a long time ago.

9751. Did the sand come up to your standard? I should have to know to what contract you are referring before I answered that question.

9752. Take Contract 118? I do not recollect; but I may say that the passing of the sand would not be part of my duty at all.

9753. But as regards the tests, did you find that the sand was of the requisite strength? I think I remember now that some crushed sandstone was sent in from Contract No. 118; I remember it came considerably above the minimum tension and crushing strength.

9754. Can you tell His Honor whether, as a matter of fact, there is any clay in crushed sandstone? I should have to refer to the tests to ascertain those particulars.

9755. *His Honor.*] Have you tested any of the sand chemically for clay? I merely wash it and record the percentage which is capable of being washed out.

9756. Have you any recollection of what you have found in the Sydney sandstone in that relation? As a rule 1 or 2 per cent. is generally washed out. In river sand, of course, none is washed out.

9757. Suppose the clay is not washed out and that the crushed sandstone is used as sand without washing, how would that affect the cement? It would not be so good as sand which had been thoroughly washed.

9758. Would 1 or 2 per cent. of clay in the sand lead finally either to disintegration of the compo. after it had set or to a gradual shrinkage of the whole mass? I do not think 1 or 2 per cent. of clay would lead to either of those things. It would require a much larger percentage to bring about shrinkage. I do not think there would be the slightest shrinkage of the concrete after it had been mixed with water, no matter how much clay there might be in it. The clay might be washed out and voids might be left, but the concrete itself would not shrink.

9759. Are you referring now to a shrinkage in the setting or to a subsequent shrinkage? I mean after it has set. Of course when it has set the clay would be incorporated in the set cement. It might afterwards get washed out, and it would also have a chemical action on the cement; but the washing out could not possibly make the mass of concrete shrink in volume. The mass would be perfectly hard. It might become honey-combed as a consequence of the washing out of the clay, but I cannot see that there would be any other result.

9760. From the particles of alumina parting with the particles of water which remained in association with them, and the thorough setting of the other materials in the cement—that would happen? Yes.

9761. How long would it probably take if such a thing did happen? We have no record of how long it would take.

9762. *Mr. Gummow.*] Do you remember making any tests for Carter, Gummow, & Co., of blocks which they had made and brought to the office? Yes.

9763. Can you remember the work in connection with which these blocks were tested? In connection with the Monier arches.

W. S. D.  
Roberts.  
20 July, 1896

- W. S. D:  
Roberts.  
20 July, 1896.
9764. Do you remember if any of the blocks had been cut out of the arches tested two years ago at North Sydney? Yes; I remember that.
9765. Did you see the construction of those arches? Yes.
9766. Was the sand washed before it was put into them? If I recollect rightly, Nepean sand was used.
9767. You do not know whether it was crushed sandstone or not? I have a notion that it was Nepean sand.
9768. Do you remember some tests being made with 6-in. cubes made by Carter, Gummow, & Co., some twelve months ago? Yes; 6-in. cement mortar cubes.
9769. Do you know what they were composed of? Of the same material which was to be used in the Monier arches.
9770. Do you know what sands we used for them? Various sands, I believe.
9771. *Mr. Davis.*] You produce a test sheet containing a series of tests made in the departmental testing room of compos. of 3 of sand to 1 of cement? Those are the tests referred to by Mr. Gummow, made by the Department from samples used in connection with the Monier arches upon Contract 77.
9772. What sand was used? Fine sand, the North Sydney quarry sand, and coarse and fine Nepean sand.
9773. Were these comparative tests made to your knowledge with a view to find out which would be the best sand to use in the Monier arches upon Contract 77? Yes.
9774. Which sand gave the best results according to that test sheet? The North Sydney quarries sand gave the highest results in all these experiments—2395·5, 2208·0, 2087·0, 2226·0. Those figures represent the crushing strength per square inch in pounds.
9775. These are compression strains? Yes; those results were obtained against results from the Nepean coarse sand, which was the next best, as follows:—1172·2, 975·0, 1244·4, 1036·0, 1115·0, and 1205·0.
9776. What did the fine Nepean sand give? 757·5, 958·6, 895·2, 1409·0, 1735·0.
9777. You made no tension tests? No; that would not be necessary.
9778. You know the ratio of tension tests to compression tests, and, having that knowledge, you could calculate the tension strains if necessary? Yes. They are calculated at one-seventh to one-tenth.
9779. The tensional strength is one-seventh to one-tenth of compression strength? Yes.
9780. Seeing that the strains to which this sand would be put would be only in compression, compression strengths alone were considered? Undoubtedly.
9781. *Mr. Gummow.*] What is the date of the document from which you have read? The 20th August, 1895.
9782. As to clay or any other foreign matter in these sands, is it not a fact that any foreign element of that description would always show itself in compression and tension tests by decreasing the strength? A foreign element like clay would, if it were present in an excessive quantity, show itself in compression and tension as well.
9783. *His Honor.*] Would a low percentage have any effect at all? A low percentage would take up such a small amount of room in the mass that the difference in strength would not be perceptible. Even if there were a void it would not be perceptible.
9784. *Mr. Davis.*] You may regard the presence of clay as creating so many voids? Rather more than that. The clay has a certain action upon the cement chemically.
9785. *His Honor.*] What is that? In preventing it from hardening if the clay is in great excess. It is, therefore, always advisable not to use sand containing too much clay.
9786. Does it prevent the material from setting? No; from hardening.
9787. *Mr. Davis.*] Would you say that all the material you washed out of sand in the making of your tests would be clay; would not a portion of it be likely to be something else? Well, we simply say that it is capable of being washed out, which is putting it in the most practical way.
9788. Referring once more to the effect which clay would have upon the shrinkage of concrete from the experiments you have made, are you in a position to say absolutely that if clay were present in small quantities in either compo. or concrete the effect would be—supposing the clay were washed away—to leave the structure honeycombed; would it have no effect upon the shrinkage of the material in mass? I do not think the question has been thoroughly settled yet in any part of the world; that is, the question as to the quantity of clay which might be present in cement without doing it any harm.
9789. *His Honor.*] Whatever mischief is caused is not caused by the disappearance of the molecules of alumina but by the disappearance of water which remains in that peculiar association with alumina which no one can find out? The cement would take up the water from the alumina, and if there were a void it would be created by the smaller volume of alumina remaining.
9790. *Mr. Davis.*] You have the same thing in ironstone; you sometimes find a small kernel which has been created by clay and organic matter; this is eventually washed out, leaving a honeycombing such as you would expect to find in concrete if clay were present in small quantities? That is one of the theories which I have heard advanced.
9791. *His Honor.*] If the molecules of clay were generally distributed right through the whole mass of set concrete or compo., would there not be a general shrinkage by the departure of the water associated with the clay, either by combination with the surrounding material or by evaporation? The concrete in that case would be too solid—too hard a mass to shrink. It might become honeycombed, or if there were anything present to disintegrate the cement, a part of it might fall to powder. Something of that sort might happen, but I do not see how the mass could possibly shrink in any way. There is not sufficient elasticity to permit of shrinkage.
9792. You possibly noticed that Mr. Young, in his evidence, said that he had experience of set concrete shrinking some years after it had set; he ascribed it to the presence of clay in the sand;—how would you explain it? I have not seen it, and I do not believe it can happen.
9793. The shrinkage, according to Mr. Young, showed itself by cracks? There might be cracks, but there would not be any shrinkage of the mass itself.
9794. You would put it down to some cross stress which had not been allowed for? Cement cracks from many causes; the presence of a certain quantity of caustic lime will crack cement.
9795. The presence of lime would actually cause expansion, would it not? Yes.
9796. You think that if such a thing did occur it would be due most likely to the presence of lime? Yes.
9797. *Mr. Davis.*] I should like you to be quite clear on this point—as to whether the presence of clay in the samples of sand when tested would not be discovered in the compression and tension tests? There is only one standard sand used in these tests as recorded in the book; but, in testing sand from different places, I should certainly say that any excessive quantity of clay would be discovered by the compression or tension strength when the sand had been mixed with the cement.
- 9798.

W. S. D.  
Roberts.  
20 July, 1896.

9798. At the time you test the sample sand that is submitted to you is it not a fact that you make up from the same cement, under the same conditions, briquettes made with sand which you regard as standard sand, that standard sand being always of a uniform quality, and that the sample of sand that is submitted is in that way compared with the standard sand of the testing-room? That is so.

9799. So that you would know absolutely whether the sand submitted for test contained any injurious element? We should certainly know whether it contained any element injurious to strength if we tested the strength of it.

9800. *Mr. Gummow.*] Besides the briquettes or blocks I mentioned, have you tested any other blocks for us? I do not recollect now.

9801. Did you ever test any of our Monier plates? Yes.

9802. Can you give us the particulars of the test? I tested some Monier plates made by your firm. The plates were 2 inches thick, and we found them in excess of the strength of ordinary plates of cement and sand.

9803. *His Honor.*] I suppose you tested them with a cross strain? Yes.

9804. *Mr. Gummow.*] Have you any idea how much stronger than ordinary plates they were? I am afraid to say now; I have not the particulars before me.

9805. *His Honor.*] Have you any idea, roughly, as to how many times stronger the plates proved to be in resisting the breaking strain than compo. plates of the same thickness would be? If I recollect rightly, they were found to be about seven or eight times as strong as ordinary compo. plates.\*

9806. *Mr. Gummow.*] Do you consider that our firm have taken more than an ordinary contractor's interest in the testing of cement and compo.? As far as my experience has gone, I think the firm of Carter, Gummow, & Co. have taken the greatest interest in obtaining information, with a view to the getting of good material. They have shown a greater interest in that matter than have any other Government contractors with whom we have had to deal.

9807. Do you know whether Carter, Gummow, & Co. have had to pay for some of these tests? I was going to say that they also had to pay for the tests.

9808. *His Honor.*] What are you by profession? An engineer.

9809. Are you a chemist? No; I am an engineer who has been obliged to make a study of chemistry in order to learn his own profession thoroughly.

9810. You have made chemistry more a speciality than have most engineers? Of course, being placed in the position in which I am, I have had to find out all the peculiarities of cement and other material.

George Dawson recalled and further examined:—

9811. *Mr. Parkes.*] On 1st July you gave the following evidence:—

6724. Did you work on the Glebe job? No.

6725. Did you work on the Annandale job? Yes.

6726. Was there any defective work done there? Casks which had been opened there were sent over to the shed to be filled with cement which I was told had been condemned. We were supposed to break them up, but when the heads were taken out we were ordered by the ganger, Bandeden, to take them to the shed, where they were filled up with cement from bags.

6727. Do you say the cement was in bags? Yes. It was taken from them and put into the casks.

6728. Where did it come from? It was Cullen Bullen cement, I think; I never noticed the brand.

In what direction did the Annandale job run? Down towards Johnstone's Creek.

9812. Where were the bags of cement to which you referred? In the cement shed, with the casks.

9813. How many bags would there be? There might be 4,000 or 5,000 for aught I knew. There was a big stack of them.

9814. Is it true that the men used to fill up casks from these bags? There was one man in the shed filling them.

9815. When was that? About February or March of this year.

9816. Was that cement still on the work when you left? Yes; on the day I left.

9817. Was there any great quantity of cask cement? Yes.

9818. Would there be 500 casks? There would be more than that, I dare say. I remember opening the shed one morning and seeing that it was chock-a-block with casks.

9819. When the casks were empty what was done? The heads were taken out, and the empty casks were sent over in the dray to the shed. There was a man there to fill them, and one day I saw him filling them. The casks came back to us refilled and reheaded.

9820. What was that man's name? Cady.

9821. Did you see any brand on the bags? I never noticed any.

9822. *Mr. Parkes.*] Who was the Government Inspector on that job? Mr. Lockyer, I think.

9823. Was Mr. Rudolph Government Inspector there? No.

9824. Or Mr. O'Hanlan? No.

9825. *Mr. Smith.*] It was only on this one occasion that you saw the men filling the casks with cement? Yes.

9826. How many of the casks were there empty then? I could not say. They used to send over 11, 12, or 13, as the case might be.

9827. Did you send them over on more than one occasion? On several occasions.

9828. Who was working with you when you sent those empty casks over? All the crowd were there together.

9829. Who were the crowd? I cannot enumerate them all.

9830. But can you enumerate some? There were Martin Byrne, Jim Driscoll, Tim. Gollagher, Dick Churchman, and others.

9831. Did you see these bags of cement in the shed? Yes.

9832. How many did you see? There might be 3,000 or 4,000. I cannot say how many, but there was a big stack of them.

9833. Was the Inspector about when these empty casks were returned to the shed? The Government Inspector stopped us from taking the heads off.

9834.

\* NOTE (on revision):—It should be explained that this is arrived at only by making the compo. with a minimum amount of water, which would increase to strength of the Monier compo. to more than double the strength of ordinary compo. (crushing strength), and the iron rods would bear all the tensile stress, which is only one-seventh to one-tenth the crushing stress.

G. Dawson.  
20 July, 1896.

- G. Dawson. 9834. It was when his back was turned that this sort of thing went on? Yes.  
 9835. Who was overlooking you on behalf of the contractors? Banded.  
 20 July, 1896. 9836. Did he give you instructions about this? Yes. It was done on his order.  
 9837. It was no one else's order? No.  
 9838. *His Honor.*] I suppose you could not distinguish the cement when it came out of the cask? No.  
 All that we could tell it by was that the casks were not so tightly filled.  
 9839. Did you notice many casks which were not so tightly filled as the casks which came out from Europe? Yes, a great many.  
 9840. How many? If I said forty or fifty I daresay I should be within bounds.  
 9841. Could you be pretty certain, on opening a cask, as to whether it was a cask which had originally come out as it then was, or whether it had been refilled? Yes, if you took particular notice.  
 9842. Did you take particular notice? Sometimes we could not help noticing.  
 9843. Could you tell in any way by the nails? Yes.  
 9844. Were the same kind of nails used in the refilled casks as in the original casks? Wire nails were used in the refilled casks and square section nails were used in the original casks.  
 9845. Could you not also tell by the state of the hoops? Yes; the hoops would not be very sound. Of course they had to be put over the top again when the casks were refilled.  
 9846. Were the hoops generally put back again? Yes. We were told to put all we could inside the casks when we sent them over to be refilled.  
 9847. When the casks were refilled could you not see the old nail holes? Yes; and the heads were all broken as well.  
 9848. So that you could be quite sure as to the casks? Yes.

William Gilliver recalled and further examined:—

- W. Gilliver. 9849. *Mr. Parkes.*] You gave us evidence when you were last here as to the length of time you had been  
 20 July, 1896. contracting in New South Wales? Yes.  
 9850. You have had to mix up a good quantity of concrete in your time. The Government, in their specifications, provide for a 7, 3, and 2, special concrete, a 4, 2, and 1, bluestone concrete, and a 5, 2, and 1, sandstone concrete? Yes, that is the specification which is generally used.  
 9851. In the case of the 4, 2, and 1, bluestone concrete, how much cement does it take to make a yard? We put in 16 feet of bluestone, 8 feet of sand, and a cask of cement, or 4 cubic feet; that would be the gauge.  
 9852. What will that run out? Nineteen and a half cubic feet.  
 9853. The proportion of cement would be about a cask and what? The difference between 19½ cubic feet and 27 cubic feet, whatever that would take. I have tested it both at Rookwood and Parramatta, using the Emu Plains sand.  
 9854. What about the 5, 2, and 1 concrete—what will that run out? Twenty-three and a half cubic feet.  
 9855. And the 7, 3, and 2 special concrete? I could not say. I have done so little of that.  
 9856. That is of a special nature, and it would take more cement than the others? Yes; it is used round manhole covers.  
 9857. But the proportions of 3 of sand and 2 of cement would make it contain more cement than the other concretes? Yes. I do not think I have done more than 20 cubic yards of it during the whole time I have been contracting.  
 9858. The specification of the Government is a very severe one. You are supposed to put the invert of the sewer in in 9-inch layers; and to grout up with an inch of cement on each layer? Yes, but we do not do that. We put a cradle in and fill in either side; 3-in. lagging is used.  
 9859. You do not carry out the specification as to the layers;—do you know if it has ever been carried out by any contractors? It is not usually carried out. We fill in the two sides of the cradle; there may be a 6-inch layer or a foot layer.  
 9860. But in the morning, or when you commence work after any stoppage, do you put a layer of cement on—that is, a flushing or grouting? It is cement-washed. It would be stepped or brought up to a head before knocking off. But if it had been left any length of time it would be flushed.  
 9861. Your calculations for the cement required do not allow for an inch of grouting? No.  
 9862. You have not taken that into account at all? No; that would come out of a separate cask, but very little of that is done.  
 9863. You have given the basis on which you proceed in making any estimate for quantities of cement? Yes.  
 9864. Did you ever have an inspector named Reid supervising your work? Yes; he supervised the Coogee culvert contract I had, and he was relieving inspector at Parramatta on two or three occasions.  
 9865. Was he a quarrelsome man? No; he was not at all quarrelsome, but he was very particular.  
 9866. You had no reason to ask for his withdrawal on any occasion in consequence of his quarrelling with your men? No. I would as soon work under Reid as any inspector I have ever worked under.  
 9867. Is he strict in carrying out his duties? He is. There can be no two opinions about that. He appears to me to be a conscientious, fair man. I do not think he would put a contractor to unnecessary expense. He never did so in our case.  
 9868. Will you read the letter I hand you? Yes. It is as follows:—"I certify that Robert G. Reid was engaged on the Sydney and suburban sewerage works as second-class inspector for about 18 months, and that his services were dispensed with in September last, on account of slackness of work. He is an industrious, sober, and reliable, man, and quite suitable for any position similar to the one he has filled in this branch.—J. DAVIS, Supervising Engineer." There are two minutes appended to that. One, by Mr. Hickson, is as follows:—"From personal observation, I can endorse the above." Then Mr. Davis has also written, on 20th January of present year:—"Inspector Reid has been employed on sewerage works since the foregoing date on two occasions, extending over a period of upwards of two years."  
 9869. You have always found him to be an upright man, keeping you up to your duties? Yes.  
 9870. But never a man who bounced anyone unnecessarily? No; I have found him, as I say, a fair man. He is particular and exacting. There is no doubt about that—more so than some of the other inspectors are.

9871. *Mr. Davis.*] As to the grouting, has any specification which you have had in connection with sewerage works provided for an inch of grouting? I cannot say what has been specified. We have always grouted when we have stopped work and when it has been left for any time. W. Gilliver.  
20 July, 1896.
9872. What do you understand by the term, an inch—do you take it to be an inch thick? No; I suppose it would not be an inch thick; but the work is always grouted when it is stepped—that is, going from the old work to the new.
9873. But what do you mean by an inch of grouting? I did not say that I had done an inch.
9874. Have you ever known it to be done to the extent of an inch in thickness? No.
9875. Would it not be absurd to talk of an inch of grouting? The work is flushed over with pretty good stuff.
9876. *His Honor.*] You grout the work to cause a bond? Yes.
9877. *Mr. Davis.*] When a piece of work is finished overnight, would there be any large holes left in the concrete;—is it not the practice to finish the concrete with a flushed surface? Yes; but in cases where it is not flush we always grout it up. As a rule, it is worked with spades up to a piece of timber to get a smooth face.
9878. That is obtained outside and inside? Yes.
9879. As to the quantity of cement in a cask—what would you say a cask of cement would contain?  $4\frac{1}{2}$  cubic feet. I have measured it repeatedly.
9880. If it were taken out of the cask, it would make in the gauge box  $4\frac{1}{2}$  cubic feet, you say? Yes.
9881. And the concrete, which was to be in the proportion of 1 of cement to 2 of sand and 5 of sandstone, would contain more sand than 8 cubic feet and more stone than 20 cubic feet—is that so or not? I am not sure that I understand your question. The figures I have given you are from my own practical experience. I know that they are correct.
9882. Have you done any tunnel packing? I have been concreting for about twenty years.
9883. Have you done any sewerage tunnel packing with sandstone concrete? Yes, over brickwork.
9884. On those occasions, was it not a fact that it was to your interest, and certainly not injurious to the work, to measure more concrete than a cask of cement would make up? The work would be packed with poor concrete, would it not?
9885. What gauge-box did you use for mixing the concrete in your tunnel packing? I could not tell you.
9886. Were the gauge-boxes for 20 feet of stone and 8 feet of sand? I could not tell you.
9887. Supposing a smaller gauge-box than 20 feet of stone and 8 feet of sand were used, would it not be necessary to take the cement out of a cask? Yes, undoubtedly it would be, if you were using 5, 2, and 1; but the concrete used, I understood, was poor concrete. Why I am so certain of the point is that one of your inspectors and myself tried the quantities I have given upon the Parramatta and Rookwood contracts.
9888. Would it be necessary to take cement out of the casks if less than a 20-foot gauge-box were used? Yes.
9889. Would not the cement have to be gauged in that case? Yes; a tunnel is lined in 3-foot lengths, and you could not mix 20 cubic feet to cover over a space of 3 inches.
9890. But cement, when mixed with concrete in that way, would have to be taken out of the cask? Yes.
9891. In all such cases it would make  $4\frac{1}{2}$  cubic feet? We have carried out a contract at the rate of  $4\frac{1}{2}$  cubic feet. That is where we were at cross purposes with the departmental officers. We measured it, and put in as much stone as would be the proper proportion with  $4\frac{1}{2}$  cubic feet.
9892. As to the sand, you say that the experiment you made was made with Emu Plains sand? Yes.
9893. Have you made any experiments with crushed sandstone? Yes; and we got half a foot less.
9894. Have you made an experiment with drift sand? No; I have never used any of that.
9895. You know that until recently drift sand was used exclusively in sewerage work? Not since I have been contracting.
9896. You do not know it of your own knowledge? No.
9897. When you said just now that a cask of cement would make 19½ feet of bluestone concrete and 23½ feet of sandstone concrete, you were giving the results of your own experiments? Yes.
9898. You put the mixture back into the gauge box? Yes.
9899. You were not present when a similar experiment was made at Plattsburg? No.
9900. Although your partner may have been present? I know of it only from hearsay. Either Mr. Curtis or Mr. Stack could give you the information.
9901. As a contractor, with a good deal of experience, do you think it would be fair to take a single experiment as an absolute criterion of what a cask of cement would make in the work? My experiment agreed with the way in which we were using the material as it went down into the tunnel.
9902. Do you think a cask of cement would make the same quantity of concrete that you made when putting the mixture into the gauge box? I suppose it would be the same thing. It was simply knocked off the shovel into the box, and then back again.
9903. Do you think the gauging of concrete of the same mixture would vary at all? It might if they used gravel with the sandstone as they did at Plattsburg.
9904. Would not the fineness or otherwise of the stone and sand have a great deal to do with the bulk which could be made by the gauging of bluestone and sandstone concrete? Undoubtedly; we have been getting our sandstone broken smaller, and we get a better result.
9905. You might make a dozen experiments and you would not get the same result supposing you used a different mesh of stone and a different fineness of sand with the same quantity of cement? It would vary more or less.
9906. *His Honor.*] It depends upon how the stone is broken, and the shape into which it is broken? Yes.
9907. *Mr. Gummow.*] Is it not the case that every man cannot necessarily agree with another man—for instance, do you agree with every man with whom you come into contact? No; I have often had a hiding and often given one.
9908. Could the man to whom you gave a hiding, for instance, necessarily agree with another individual? Not necessarily, I suppose.
9909. So that, although you could agree with Inspector Reid, it is possible that Inspector Reid's temperament might not agree with that of some other persons? That is quite possible. I have spoken of Reid as I found him.

- W. Gilliver. 9910. You do not infer that, because Reid does not agree with some one else, that that other person is necessarily in the wrong? From my experience of Reid I should say he was a man who would be satisfied with a fair thing.
- 20 July, 1896. 9911. But if he disagrees with anyone else, does it necessarily follow that Reid is right, and that the other person is wrong? I never found Reid unreasonable.
9912. You say that bluestone concrete of the gauging you have named would make  $19\frac{1}{2}$  cubic feet, and that the sandstone concrete would make  $23\frac{1}{2}$  cubic feet? Yes.
9913. If other witnesses say they would go only 16 feet and 20 feet, are they incorrect? Not necessarily. A good deal would depend upon how the stone was broken and forked.
9914. At that rate you cannot tell to within  $3\frac{1}{2}$  cubic feet whether you or they are right? We simply forked the stuff out of the heap, and put the sand in it; but I am quite satisfied with the results.
9915. If another witness says that the quantities you gave would make 16 and 20 cubic feet, are they correct or not? I do not see how I could answer that question.
9916. *Mr. Parkes.*] Are you using for your concrete sand crushed from stone which comes out of the tunnelling? It comes from a hill alongside.
9917. Carter & Co. are using sand from stone which comes out of their tunnelling, are they not? I could not say.
9918. But it comes from the neighbourhood, does it not;—it is all the same class of stone? Yes. I think the man who supplies them is working within a few yards of the place where we are working. We are practically working at the one place.
9919. *Mr. Gummow.*] Do you know where the sand we are using comes from;—are you sure that we are not using North Sydney sand in our aqueducts? I could not say. M<sup>r</sup> Millan said he was supplying you with sand, and he said that it had been already tested, that he could supply us with the same sand, and that there would be no bother about it.
9920. But does the sand we are using come out of the tunnelling? I do not know where it comes from. I know that we are getting better stone out of our tunnelling now than is being used for the sandstone concrete; it is very much harder.

---

Peter Parfitt sworn and examined:—

- P. Parfitt. 9921. *Mr. Parkes.*] On July 6th of this year, Mr. Rigg, your assistant manager, was a witness before the Commission, and he said that he did not know your business or connection with certain questions. Other-wise you would not have been asked to attend to-day. Two days before Mr. Rigg came here, was not Mr. Hickson in your office? I could not answer that question.
- 20 July, 1896. 9922. Did he not see you? No; I never saw him in my life to my knowledge.
9923. Mr. Hickson has said before this Commission in answer to questions that he had a communication from the manager or sub-manager of your Bank, in which he said that, if any question arose in connection with the sureties of Mr. Forrest and Mr. Gillan, if the matter were referred to him he would furnish all particulars. Did you send that? It is quite possible that such a communication may have been sent from the office. Personally I had nothing to do with it.
9924. And you say you have never seen Mr. Hickson in your life? I have not to my knowledge.
9925. Mr. Hickson in his evidence said that the manager or sub-manager of your Bank had said that he would give any information as to the stability of the firm, and he thought that Mr. Gillan's name was specially mentioned. Mr. Rigg in his evidence said that no inquiries had been made of him. Did you have any conversation with Mr. Rigg about this matter at all? No. The names you are using now are hardly familiar to me.
9926. You never had any conversation at all with your sub-manager as to the names as sureties of Mr. Forrest and Mr. Gillan, which were given to the Works Department? No.
9927. On no occasion? No.
9928. You never heard from any of your officers whether Mr. Hickson was on July 4th at the Bank? No.
9929. Could you furnish the Commission with the credit limit given to the firm of Carter, Gummow, & Co.? We have no fixed limit at all.
9930. Have you not a book in which you minute up the credit limits which you give to your clients? When we absolutely arrange matters with them; but as far as I can discover there is no record of any such arrangement with these gentlemen. Their account used to swing up to about £3,000.
9931. Was that their limit? We expected an explanation if they went any further than that. As far as I have been able to see upon the records which I looked up before coming here they have not gone beyond that.
9932. Have you, as manager of the Bank, looked into the account of the firm? Not specifically. Since I took charge here the account has been working towards reduction.

---

Walter Alexander Smith recalled and further examined:—

- W. A. Smith. 9933. Mr. Smith, you have read the evidence of Mr. Bryant and Mr. Symonds given before the Commission on 10th instant? Yes.
- 20 July, 1896. 9934. And you have read more particularly the statement put in by Mr. Bryant as the result of his examination of the vouchers relating to the cost of the Monier culvert at Strathfield? Yes.
9935. Is that statement taken from the vouchers a fair statement? No, it certainly is not.
9936. Why do you say it is not a fair statement? Because it includes many items which, although they may be chargeable to the Main Western Road, are not chargeable to the Monier culvert. They are correctly paid from the Main Western Road Vote, but they are not fairly chargeable against the Monier culvert.
9937. Have you gone through very carefully all the vouchers referred to in Bryant's statement? Yes.
- 9938.

9938. And you have prepared a statement showing in detail in what respects you differ from that statement? Yes. It is as follows:—

W. A. Smith.  
20 July, 1896.

## Monier Culvert, Strathfield.

|   | £   | s. | d. | £   | s. | d. |
|---|-----|----|----|-----|----|----|
| Completion of culvert and <i>all works</i> incidental thereto, as per vouchers collected by Messrs. Symonds and Bryant.....     | 225 | 0  | 0  | 225 | 0  | 0  |
| Completion of culvert and all works incidental thereto, as per vouchers collected by Messrs. Symonds and Bryant.....            | 225 | 0  | 0  |     |    |    |
| No. of Vouchers. <i>Less</i> amounts not chargeable to the work, as follows:—   |     |    |    |     |    |    |
| Pt. 389 14 casks of cement not used in work .....   | £9  | 9  | 0  |     |    |    |
| 368 Dressed stone not used in culvert (probably for kerbing and guttering) .....  | 6   | 3  | 0  |     |    |    |
| Pt. 275 & 354 43 days' pay to Bramston at 12s. while not actually engaged on the work of this particular culvert .....          | 25  | 16 | 0  |     |    |    |
| 250 Lanterns for general use on the M.W. Rd. and elsewhere .....  | 1   | 8  | 2  |     |    |    |
| 414 Wages on the M.W. Rd. after the culvert was constructed and opened for traffic, <i>i.e.</i> , subsequent to 2nd August..... | 10  | 0  | 11 |     |    |    |
| 201 Bolts not used in this work .....   | 0   | 10 | 5  |     |    |    |
| 208 & 191 Timber sent to Iron Cove, and not used in this work.....  | 8   | 17 | 10 |     |    |    |
|   | £62 | 5  | 6  | 62  | 5  | 6  |
|   |     |    |    | 162 | 14 | 6  |

Completion of concrete structure and connections only, as per attached statement:—

| SUMMARY.                    |  | £  | s. | d.       |
|-----------------------------|--|----|----|----------|
| Materials and carting ..... |  | 50 | 19 | 6        |
| Wages .....                 |  | 53 | 11 | 3        |
| Supervision .....           |  | 5  | 8  | 0        |
|                             |  |    |    | 109 18 9 |

NOTE.—This is exclusive of office supervision.

Completion of Monier arch culvert, including three pipe connections and four gully shafts, but *exclusive of the lowering of main, removal of scour-pipe, &c., removal of old structure, remaking of road, cutting outlet drain, laying kerbing and guttering, and relaying asphalt footpath*, as per following vouchers:—

| WAGES.   |  | £  | s. | d. | £   | s. | d. |
|--|--|----|----|----|-----|----|----|
| Total wages paid, as included in vouchers collected by Messrs. Symonds and Bryant... ..  |  |    |    |    | 114 | 14 | 2  |
| <i>Less</i> amounts not chargeable under this heading—   |  |    |    |    |     |    |    |
| Pt. 189 P. Brady, for carting on road (Isles did all carting for culvert) .....  |  | 0  | 15 | 0  |     |    |    |
| Pt. 190 M. Ahern, wages to 31/5/94—12 days at 8s. is chargeable; balance of £5 6s. 6d. not chargeable .....  |  | 5  | 6  | 6  |     |    |    |
| Pt. 224 Wages to 9/6/96 include removing half of old structure, cutting outlet drain and trench for first half of culvert—five men—four days, and three men—two days, at 7s. 8d.....   |  | 9  | 2  | 0  |     |    |    |
| Pt. 270 Wages to 23/6/96 include making up roadway over first half of arch—two men half-day removing second half of old structure, and cutting trench for remainder of new structure—five men—four days, at 7s.....                      |  | 7  | 7  | 0  |     |    |    |
| Pt. 363 Wages to 28th July include making up second half of roadway—two men half day, and redressing and relaying kerbing and guttering—three men—six days at 7s... ..   |  | 6  | 13 | 0  |     |    |    |
| 414 Wages to 16/8/96, after the culvert was completed and opened for traffic, <i>i.e.</i> , subsequent to 2nd August .....   |  | 23 | 0  | 11 |     |    |    |
| 220 Wages to 7th April. Up to this date no work in connection with the culvert had been undertaken. The amount (£2 2s.) is therefore deducted .....  |  | 2  | 2  | 0  |     |    |    |
| Included in the foregoing wages Davidson is credited with working 49½ days, whereas he only worked 30 days, being sent to gasworks bridge, while the remainder of the men stayed at the culvert; £6 16s. 6d. is therefore deducted ..... |  | 6  | 16 | 6  | 61  | 2  | 11 |
|  |  |    |    |    | £53 | 11 | 3  |

Completion of Monier arch culvert, including three pipe connections and four gully shafts, but *exclusive of lowering of mains, removal of scour-pipe, &c., removal of old structure, remaking of road, cutting outlet drain, laying kerbing and guttering, asphalt footpath, &c.*

| MATERIALS AND CARTING.  |  | £ | s. | d. | £   | s. | d. |

## SUPERVISION OF INSPECTOR.

|  |    |    |   |         |
|--|----|----|---|---------|
| Total amount paid, as per vouchers collected by Messrs. Symond and Bryant.....     |    | 31 | 4 | 0       |
| Deduct 43 days at 12/- a day while Bramston was not employed on this culvert ..... | 25 | 16 | 0 | 25 16 0 |
|  |    | £5 | 8 | 0       |

W. A. Smith.  
20 July, 1896.

9939. So that from a further investigation of the vouchers it would appear that the actual cost of this Monier culvert alone instead of being £114 odd is really £109 18s. 9d? That is what I make out from the vouchers. When I was giving my evidence, I stated that I went into the matter most carefully at the completion of the work, and that the figures came to £114. I probably included office supervision under that heading. I do not at this moment recollect how I made it up. It was made up from the Inspector's time-book, and from the material we had ordered at the time.
9940. Did Bryant have the supervision of the work? He had nothing to do with it—he was a clerk in the office.
9941. Did Mr. Symonds supervise the work? No; he simply paid the men.
9942. It was you who supervised the work? Yes.
9943. And you had a special reason for supervising it yourself? Yes; it was a new thing. It was the first culvert of the kind which had been erected, and I supervised it myself.
9944. You are quite sure that the quantity of cement shown in Mr. Bryant's statement could not have been used in the construction of the arch? No. There were 24 yards of concrete and 5·75 of compo., so that it would only take twenty-four casks of cement for the concrete and, say, ten for the compo.—that would be only thirty-four, whereas I am credited with using forty-nine.
9945. And as to the timber? As to the timber, the platform for the concrete was composed of old boards from the store which were splashed all over with tar. I remember that while the work was going on I noticed that. So also with regard to the planks used in putting up the wall. The only new timber provided was for the centering and the two or three little beams which were used in connection with the work. I asked Mr. Boys, of Parramatta, to measure up the centering used, and he makes 194 superficial feet. The voucher, according to Bryant's statement, gives me credit for, I think, £1 7s. for timber; that amount would supply, roughly, 270 superficial feet. These two items of £4 13s. and £4 4s. 10d., I have deducted, because the timber could not possibly have gone into this work.
9946. As to the wages of Mr. Bramston for nine days? It would not be more than that.
9947. What was he doing besides this culvert at the time? He was an inspector for the whole division. He had usually a great number of small works going on. He would probably have works going on in two or three districts at one and the same time, and he would go from one work to the other.
9948. And you are perfectly satisfied as to the correctness of the other items you have given? Yes; I am quite satisfied. I have gone carefully into them.
9949. What do you say with regard to the statement as to your using part of the Callan Park vote? I do not see how I could have used any part of it. The vouchers shown by me include everything in connection with the culvert, and they were all paid from the Main Western Road vote. I have no recollection of anything being paid for out of the Callan Park vote.
9950. That was a separate vote by Parliament for this particular work at Callan Park? Yes; £1000 was granted.
9951. As to works upon the Main Western Road, what is the course as to that one vote for the whole of the road? There is an annual maintenance vote for the Main Western Road, and all small works, such as this culvert, would be paid from the annual vote. On this occasion the Commissioner gave his approval for the construction of the culvert from the annual vote.
9952. So that there would not be any papers recommending a particular sum for the culvert? No. There was only one paper, as far as I can recollect, in connection with this culvert. Mr. Hickson made some minute in reference to it, and asked me to see him. Then, after I had seen him, he wrote "Approved" upon the paper. I remember that.
9953. Have you seen the paper lately? I saw it before it came down to this room.
9954. This paper is still to be seen with the office papers? Yes; I saw it when the papers came down here. The paper was with the Ormond-street culvert papers.
9955. As a matter of fact the Commissioner of Roads has power, under an Act, to appropriate a portion of the Main Western Road vote for these small works? Yes.
9956. So that only his authority would be necessary in dealing with a small matter of this kind? That is all.
9957. As to the Callan Park grant, the whole of it was not used for the purpose for which it was made? No.
9958. I believe there was a balance of some £227? Yes; that was written off because it was not required. Dr. Manning was satisfied with all that had been done, and there was no occasion to spend the balance.
9959. Bryant says that you told him to charge against the Callan Park account wages which were actually earned, and known to have been earned, upon the Strathfield culvert? That is absolutely untrue.
9960. As far as you know, you never authorised the debiting against one account of expenses incurred in connection with another? No; excepting in very small matters of wages and material, or for the replenishing of stores, and those charges would about balance up in the year.
9961. Did Mr. Symonds ever object, as he said in his evidence, to the manner in which payments were being made? I have no recollection of it. I see from his evidence that he admits that he may not have spoken to me, and that he may have spoken to Bryant.
9962. You do not recollect his speaking to you? No; not at all.
9963. Bryant said that he was sent for by the Department to adjust your accounts after he had left;—what was it that happened? The facts are these. When my office as divisional engineer was abolished, and the books were made up, it was found that the deposit account was incorrect to the extent of £7 12s.; that amount could not be traced. Finally, a receipt was found in the office signed by Bryant, showing that he had received the money, and had apparently not paid it into my account. There was that amount of shortage, and I wrote to Bryant because I thought it right to give him a chance of explaining the matter, if a mistake had been made. He at once came in and said he remembered paying the money into the bank. After making inquiries he found that he had done so, and that the bank had made an error, and had put the amount to the credit of a Mr. W. Smith, at Hay.
9964. That was the whole cause of the trouble? Yes.
9965. And that is the whole matter that Bryant had to adjust? Yes.
9966. Do you remember that some cement was bought from Carter, Gummow, & Co.? Yes; that was for the Callan Park work.

9967. On whose authority was it done? Some cement was tested and condemned, and the whole work was stopped. I was anxious to get on with the construction, and I asked permission to obtain some cement elsewhere. That permission was given by Mr. Scarr, acting for Mr. Hickson. On going out of the office I met Mr. Carter, and I asked him whether he could oblige me with twenty-five casks of cement. He said, "Certainly," and sent the cement down to the work. W. A. Smith.  
20 July, 1896.
9968. As to the size of this culvert at Strathfield, you saw what Mr. Symonds said about it? From what I remember, the area of the culvert is nearly twice as big as it need be. Culverts are always built in that way near towns or very thickly populated places if the catchment area is unimproved, because the area eventually becomes covered with houses and footpaths and macadamised roads, and the water then flows off more quickly, and a larger culvert would be required to carry it off. In the first place, you would probably allow for only half an inch an hour flowing off, whereas if the whole area were covered with houses the water might flow off at the rate of 2 inches an hour.
9969. *Mr. Gummow.*] Could you tell me the cost per cubic yard of the centering for the Monier arch? It runs out at about £1 per cubic yard.
9970. *Mr. Parkes.*] Have you books showing the complete expenditure upon the culvert; for instance, take the case of Mr. Bramston's wages—you say that he had many works to look after;—can you show us in any book where his time has been entered? No, I do not think I can.
9971. What works had he to inspect during the time this culvert was going on, and how would his time be divided? I do not remember. I know that he had a great many works to look after within a month or two of that time.
9972. You have no book in which a record of his time for each week would be kept? No.
9973. And how do you know he was occupied elsewhere? Well, I know what time it would be necessary for him to put in in connection with the culvert. I know from the evidence of men to whom I have spoken, who were there at the time, that Mr. Bramston could not have been at this culvert for the period given.
9974. But you have no book in which his time is entered? No.

John Carter recalled and further examined:—

9975. You have handed to the Commission a paper showing the particulars of the landed property held by Carter, Gummow, & Co.;—besides the buildings upon the Lodge estate, have any of the other allotments buildings upon them? One of them. There is a detached cottage on the allotment on the Illawarra Road, Marrickville. [*Vide Appendix No. 37.*] J. Carter.  
20 July, 1896.
9976. Have any of the other allotments buildings on them? The property in Hill-street has a stable upon it.
9977. Otherwise the land is vacant? Yes.
9978. On 14th May, 1890, you transferred your account from the Commercial Bank to the Bank of New Zealand? Yes.
9979. And you paid to the Commercial Bank to square accounts £211 12s. 11d.? Yes.
9980. At the time you had the transaction with Mr. Weedon, and when Mr. Weedon paid a certain amount of money into the firm's account, was not the bank asking you to reduce your overdraft? It is as well to be particular in these matters. In the first place, Mr. Weedon did not pay the amount in; and, in the next place, the bank has never asked me to reduce an overdraft since I have been doing business with them.
9981. But at this time you were wanting money? Not in the least.
9982. Then why, upon 8th March, 1895, did you increase your mortgage on the Lodge property—£3,500—by £1,000? That was purely a matter of business.
9983. You put the £1,000 into your business, did you not? Yes.
9984. You wanted the money for the business then? Yes; I would borrow £10,000 for the business to-morrow if I could get it.
9985. Then you need it for the business? I should do so from a business point of view; not that it is absolutely needed. We never needed money in that way.
9986. Did you lodge any further security with Sir William Manning for this further sum of money? Not anything. He was only too glad to give it at the price.
9987. The list of properties you have handed in includes some of your own private property? Yes.
9988. Take the detached cottage in the Illawarra Road—is that your private property? It is the firm's property, but it is in my name.
9989. What is the value of it? £775. That is the Richardson and Wrench valuation.
9990. That is not the property which belongs to James Gillan? A part of it.
9991. It is not his cottage property which has been previously referred to? No; but as a member of the firm he has an interest in it. It belongs to the firm, although it is in my name.
9992. Then there is the vacant land in Alfred-street, North Sydney? That is in my name, and belongs to Carter, Forrest, and Snodgrass.
9993. What is the value of it? About £400, I suppose.
9994. Then as to vacant land in Alfred-street? That is mine.
9995. As to the stables and land in Hill-street, North Sydney? That is my own property.
9996. And the frontage of 30 feet, with a depth of 71 feet, or thereabouts, being part of lot 12, section 2, town of St. Leonards, parish of Willoughby? That is also my private property.
9997. What is the present value of the Lodge estate;—what is the Richardson and Wrench valuation? £8,500, I think. It was good enough for Sir William Manning to advance £4,500 upon it. I find I made a mistake in giving my evidence the other day about this property. I had an idea that it was in my name, but my solicitor tells me that it is in the names of Carter, Forrest, and Snodgrass, each having a third share.
9998. Mr. Gillan has no interest in it? No.
9999. Is the land in Miller-street included in the Lodge property? No; it is not.
10000. What is that worth? About £400.
10001. Had Mr. Weedon any hold upon the Lodge property? No. His allotments are the Miller-street land, the Illawarra Road land, and my own private property in Alfred-street and Miller-street—four separate blocks. 10002.

- J. Carter. 10002. *His Honor.*] Those were given to him as security? Yes.  
 10003. *Mr. Parkes.*] A cheque of yours of 1st September, 1894, was drawn in favour of a man named Andrews;—is he an inspector? No.  
 10004. What is he? A blacksmith, I think. You will find other cheques drawn in his favour.  
 10005. Then there was a cheque paid to a Mr. Bellingham;—who is that? Cook and Webb's foreman. He was employed by us to fit up a machine at Stuart Town.  
 10006. On 18th May, 1894, there is a cheque for two guineas payable to J. Corp;—was he an inspector? Yes.  
 10007. Then there is a cheque payable to a man named Horney;—is he an inspector? No.  
 10008. And another to a Mr. Board;—is he an inspector? No. Speaking from memory, I think he is a grazier at North Shore.  
 10009. Was not Chiene's statement that Corp received a regular fee from you true? No; it is not true. I said before, and I say it again, that I assisted him repeatedly. As to his receiving a regular fee, that was quite out of the question. I did not see him at all regularly.  
 10010. This was a cheque towards his assistance? I should think, judging from the date, that it was probably a subscription towards his funeral expenses. I remember that he died about a couple of years ago, and the cheque is dated May, 1894. I think Board was in business at North Shore. I gave him money on account of a friend of mine, who is now in New York.  
 10011. Had you any security from O'Hanlon and Rudolph for the money you lent to them? Yes. In the case of O'Hanlon, I had a mortgage over the cottage when it was in a fit state to mortgage. I am referring to the house which he built upon the land. I assisted him to buy at Drummoyne.  
 10012. Do you know the street in which it was situated? No.  
 10013. Have you the title deeds? The transaction was over years ago. The money was all paid back in one cheque through Johnson, Minter, and Simpson.  
 10014. Does that appear in your accounts? Yes.  
 10015. What happened in Rudolph's case? He gave me a written acknowledgment of the debt, signed by himself and his wife, and, it being a transaction between friends, as he and I were, that was quite sufficient for me.  
 10016. No promissory note was given? No.  
 10017. *Mr. Gummow.*] As to this extra £1,000 on the Lodge property, you say that Sir William Manning was glad to give it? Yes.  
 10018. Did he lower the interest on the money already advanced? Yes, a  $\frac{1}{2}$  per cent.  
 10019. As well as giving you the extra £1,000? Yes.  
 10020. Therefore, it was good business on your part? I thought so.  
 10021. As to wanting money for your business, can you remember any transaction with the head manager of your bank in Melbourne about two years ago? Yes; I remember meeting Mr. Andrews there, the general manager of the Bank of New Zealand in Australasia at that time. I had overdrawn £10,000 or £12,000. Mr. Parfitt did not recollect that transaction this morning. No security was lodged with the bank for that overdraft, and in the face of it, Mr. Andrews told me that I could draw £15,000 upon my Melbourne account for the works we had in hand there, if I wanted it.  
 10022. Without any security whatever? Yes, without any security.  
 10023. Was not that a time of financial crisis? Yes, the banks were all breaking.  
 10024. It was a time when the banks particularly wanted their money;—it was not boom time, when they had any amount to spare? It certainly was not.  
 10025. As to the cheques to Andrews, do you remember what they were paid for? It was for mechanical work, blacksmithing, and so on in connection with a patent brake we were trying to introduce.  
 10026. As to Mr. Weedon's transaction; when did you give him those properties as mortgages—was it this year or last year? Last year.  
 10027. You are absolutely certain of that? Yes.  
 10028. It was about the date you received his cheque? Yes.  
 10029. You gave him an equitable mortgage at the same time? Yes.

---

WEDNESDAY, 22 JULY, 1896.

James Gregg sworn and examined:—

- J. Gregg. 10030. *Mr. Parkes.*] What is your position? I am managing director for Richardson and Wrench (Limited), auctioneers and land valuers.  
 22 July, 1896. 10031. You have valued certain properties of Carter & Co. and John Carter? Yes.  
 10032. Did you value the property known as the Lodge property at North Shore? No. It was valued in 1893, and it was revalued in 1895.  
 10033. What was the amount of the 1895 valuation? £7,500.  
 10034. Can you give from memory a description of the property as it stood in 1895? Yes. There were 330 feet to the east side of Miller-street, and 263 feet to the south side of Maclaren-street. There is an old residence upon the property, and a new stone house where Dr. Kyngdon is now living.  
 10035. What would be the value of the property at the present day? It would be a little weaker than in 1895, no doubt.  
 10036. Had you the deeds of the property? No.  
 10037. You have seen the deeds? No.  
 10038. Whose property did you understand it to be? The valuation was made on account of Carter & Co.  
 10039. There is a vacant allotment in Miller-street belonging to Mr. Carter;—that was not included in the Lodge property? No.  
 10040. What is your valuation of that vacant allotment? £337 10s. was the valuation I made yesterday of the block of land having 75 feet frontage to the west side of Miller-street, between Falcon and Ernest Streets, with a depth of 132 feet, being portion of allotments 11 and 12 of section 18, township of St. Leonards.  
 10041. You also valued a vacant allotment of land, being portion of allotment 12 of section 2, town of St. Leonards, having 30 feet frontage to Hill-street, between Miller and Elizabeth Streets, and a depth of 71 feet?

- feet? Yes. There are some old sheds on it, which are occupied as stables by cabmen. I estimate the present market value of the allotment to be £170. J. Gregg.  
22 July, 1896.
10042. You also valued a block of land having 99 feet frontage to the east side of Alfred-street, between Falcon and Ernest Streets, with a depth of 132 feet, and with a lane entrance at the rear side, being portion of lot 16, section 24, of town of St. Leonards? Yes. I estimate the present market value to be £594.
10043. You also valued an allotment of land having 35 feet 8 inches frontage to the west side of Illawarra Road, a few yards south of Woodlands-street, with a depth of 128½ feet, and with an entrance from Woodlands-street? Yes. On that property is erected a detached cottage named "Dimora." It is of brick cemented on a brick foundation, slate and iron roof, bay-window, and verandah in front, also verandah at rear; and containing hall, five rooms, bathroom, pantry, kitchen, and wash-shed. There is a small shed in the yard. I was unable to go into the house, the tenant being out yesterday when I was there; but I know the cottage very well, and I estimate its present market value to be £550.
10044. The total of the properties you valued would be £1,651 10s.? Yes.
10045. That is the present-day value? Yes.
10046. You consider it a full and liberal value? Yes, I think I have given full value.
10047. Do you know a property named "Blink Bonnie," in Fairfowl-street, Dulwich Hill? I know the street, but I do not know the cottage.
10048. What would be the value of the properties of the firm and of Mr. John Carter, including the Lodge property? The Lodge property would have a value of, (say) £7,500. The properties I valued yesterday would have a value of £1,651 10s. That would give a total of £9,151 10s.
10049. *Mr. Carter.*] With reference to the property in the Illawarra Road, do you remember that we purchased it on your valuation two years ago? Yes.
10050. Do you remember what your valuation then was? £750.
10051. In 1893 you valued the property of Carter & Co., known as the Lodge property, at £8,500? Yes.
10052. And you valued the land in Alfred-street at £800? Yes.
10053. These properties have depreciated in value since then? Yes, I am sorry to say they have.
10054. *His Honor.*] Is there any appreciable difference between the values of property in the middle of last year and at the present time? The value would be weaker, I should say, by 10 per cent.
10055. *Mr. Carter.*] If I told you that I had refused £16 and £17 a foot within the last three months for the Miller-street property, would that alter your opinion of its value? It would not.

George Christie re-called and further examined:—

10056. *Mr. Parkes.*] Since you were last here you have made various researches into papers in connection with contracts let to Carter & Co., and you are in a position to make a report? Yes. G. Christie.  
22 July, 1896.
10057. In the first place, you have made an examination into the position of the dealings of Mr. S. H. Weedon, supervising and district engineer, with Carter & Co., and stated to have been with Mr. John Carter? Yes.
10058. Will you read the result of your researches? Yes; I have written the following memorandum:—

MEMO. No. 6.

FINANCIAL dealings of Mr. S. H. Weedon with Messrs. Carter, Gummow, & Co.

Mr. Carter has furnished and lodged with the Commission a list and description of all his properties, also those of Messrs. Carter & Co. and Carter, Gummow, & Co. He has also furnished a description of the properties over which an equitable charge was given to Mr. Weedon by deed, dated 17/6/95. The schedule to the deed includes four properties, regarding which Mr. Carter's lists furnish the following particulars:—

- No. 1.—Vacant land. Title in the name of John Carter, but held by him in trust for G. Forrest, D. Snodgrass, and self equally.
- No. 2.—Vacant land. Title in the name of John Carter.
- No. 3.—Land and stables. Title in the name of Edward Carter.
- No. 4.—Detached cottage at Marrickville. Title in the name of John Carter, but held in trust by him for F. M. Gummow, G. Forrest, James Gillan, and self, equally.

These properties have been valued by Messrs. Richardson and Wrench, as follows:—

|             | £      | s. | d. |
|-------------|--------|----|----|
| No. 1 ..... | 337    | 10 | 0  |
| No. 2 ..... | 594    | 0  | 0  |
| No. 3 ..... | 170    | 0  | 0  |
| No. 4 ..... | 550    | 0  | 0  |
|             | £1,651 | 10 | 0  |

It is evident from the foregoing that of the four properties, the deeds of which Mr. Weedon holds, two are the property of Carter and Co. and Carter, Gummow, & Co. respectively, viz.:—

|                        | £    | s. | d. |
|------------------------|------|----|----|
| No. 1, valued at ..... | £337 | 10 | 0  |
| No. 4, valued at ..... | 550  | 0  | 0  |
|                        | £887 | 10 | 0  |

As to No. 3, the title is in the name of Edward Carter, for whom, apparently, Mr. John Carter is administrator. The value of this property is £170. No 2 is in John Carter's name, and is valued at £594.

Sydney, 22/7/96.

GEO. CHRISTIE,  
F.S.A.A.

10059. It would seem, therefore, that the money lent by Mr. Weedon upon the properties referred to is in excess of the value of those properties? Yes. The valuation of the properties is £1,651 10s., and the advance made is £2,000.
10060. And the greater proportion of the properties which he holds as securities belongs to the firm of Carter, Gummow, & Co.? Yes. The total is stated to be £887 10s.
10061. Belonging to the firm? Yes.
10062. So that a little more than one-half of the value of the properties which he holds as securities attaches to properties held by Carter, Gummow, & Co.? Yes.

10063.

G. Christie. 10063. You have also examined papers in connection with the testing of cement, especially with reference to the cement tested by the Department of Public Works for Contracts 79, 79A, and 69? Yes; I have written the following memorandum:—

## MEMO. No. 7.

Re Cement tested by the Department of Public Works for Contracts 79, 79A, and 69.

(a) REFERENCE is made to Mr. Roberts' evidence regarding his records of cement tested. (b) From his Registers of Tests has been extracted the following statement of cement tested for Carter & Co. and Carter, Gummow, & Co., for Contracts 79, 79A, and 69. The total number of casks of cement tested for these contracts is shown by the Statement to be 11,740, distributed as follows:—

| North Shore Contracts— |     |     |     |     |     |       |        |
|------------------------|-----|-----|-----|-----|-----|-------|--------|
| 79                     | ... | ... | ... | ... | ... | ...   | 5,050  |
| 79A                    | ... | ... | ... | ... | ... | ...   | 1,500  |
|                        |     |     |     |     |     |       | 6,550  |
| Contract No. 69        | ... | ... | ... | ... | ... | ...   | 5,190  |
|                        |     |     |     |     |     |       | 11,740 |
|                        |     |     |     |     |     | Casks | 11,740 |

Sydney, 22 July, 1896.

GEO. C.

STATEMENT of the Quantities of Cement tested by the Department of Public Works for Contracts 79, 79A, and 69. (Extracted from the Record Books of Cement Certificates, and tallying with the certificates signed by Mr. Hickson, included in the portfolios of papers of those contracts.)

| Register No. | Date.    | Total. | Distributed to Contract No. |        |        | Register No. | Date.    | Total. | Distributed to Contract No. |        |        |

| 974          | 6/4/94   | 50     | 50                          | .....  | .....  |              |          |        |                             |        |        |
| 981          | 16/4/94  | 600    | .....                       | .....  | 600    |              |          |        |                             |        |        |
|              |          |        |                             |        |        |              |          | 11,740 | 5,050                       | 1,500  | 5,190  |

GEO. C., 22/7/96.

10064. The book containing the cement tests by the Department is very carefully kept, is it not? It seems to be.

10065. The name of the contract to which cement is delivered is inserted? Yes.

10066. The name of the contractor is also inserted? Yes.

10067. Also the number of casks? Yes.

10068. And to show with what care the book is kept, there are only two alterations in the number of casks affecting tests in which Carter, Gummow, & Co. were concerned? Yes. There are two quantities indefinite in that respect. In one case 700 in red ink is put over 500, and in another case 600 is marked for 500. In neither of these cases do the certificates affect the return I have handed in.

10069. Then what do you say as to the difference between the information you have collected from the merchants and the records of cement tests for Carter & Co. upon these contracts? In my memo. of the 8th July it is stated that the quantities delivered at North Shore, Contracts 79 and 79A, were 6,702 casks, and to the Marrickville Contract 69, 6,729 casks, giving a total for these contracts of 13,431 casks; the total quantity of casks tested being 11,740 casks.

10070. That is the total quantity of cement submitted for test in connection with these three contracts? Yes.

10071. It does not include that which has been rejected, does it? It includes all that has been tested, whether rejected or not.

10072. You have also prepared a memorandum setting forth the effect of certain claims wrongly included in Contract 79? Yes; reference is made to pages 321 and 322 of the Parliamentary papers, and my report is as follows:—

## MEMO. No. 8.

Re certain Claims included in payments on Contract 79, which were properly chargeable to the Bondi Contract, &c.

(a) ON pages 321 and 322 of the Parliamentary return there are lists of certain amounts claimed by Carter & Co. which are evidently not chargeable to Contract 79, excepting, possibly, in one or two instances, but which Mr. Boys, the Resident Engineer on Contract 79, was instructed by Mr. Davis (minute 14/12/93) to include in the next progress return of that contract. There is a further minute as follows:—"The fines had better be 'returned' under the item of 'dray, &c.,' in schedule." Mr. Boys appears to have again asked for instructions on 19/12/93, and Mr. Davis to have confirmed his previous instructions, 20/12/93.

(b) Items included in certificate 24, Nos. 43, 44, 46, 47, and 48, clearly do not belong to Contract No. 79, for the rates are different to the corresponding items in the schedule for that contract.

For instance—

Item 43 is charged at 16/-, should be 20/-.  
Item 44 do 12/-, do 14/-.  
Item 46 do 10/-, do 10/-.

Item 47 is charged at 20/-, should be 15/-.  
Item 48 do 10/-, do 8/-.

10073.

10073. You have also prepared a memorandum in reference to the returning of Messrs. Bond and Hudson's tender deposit, (£369) in connection with Contract 79? Yes. It is as follows:—

G. Christie.  
22 July, 1896.

## MEMO. No. 9.

*Re* the returning of Messrs. Bond and Hudson's tender deposit (£369), Contract 79.

The tenders for Contract 79 were made on the Department's printed form. Messrs. Bond and Hudson's tender on this form appears on page 252 of the printed papers as follows:—

## TENDER for Contract No. 79, Sydney Sewerage.

To the Honorable the Minister for Public Works, Bridge-street, Sydney, N.S.W.

We, the undersigned, do hereby tender and offer to construct, completely finish, and maintain, the various works for Contract No. 79, Sydney Sewerage, in accordance with the conditions of contract, specifications, and drawings, prepared for that purpose in your Department, for or at the rates particularly entered in the accompanying schedule of prices, and enclose herewith deposit, as required by clause 20 of the general conditions.

Should this tender be accepted, we undertake to lodge with the Under Secretary for Public Works, within seven days from the date of notification of acceptance of this tender, a Bank deposit receipt in the name of the Secretary for Public Works for the sum of two thousand pounds sterling, as security for the due performance of the contract.

In the event of our failing to do so, or to sign the required contract within the time specified in clause 20 of the general conditions, we hereby distinctly agree to forfeit to the Queen the sum deposited with this tender.

BOND AND HUDSON,  
88, Sussex-street.

Sydney, 10th June, 1891.

The general conditions contain the following:—

In the event of any tenderer failing to take up his tender, complete the bond, and proceed with the contract within the time specified, or withdrawing his tender after it shall have been opened, whether such tender shall have been accepted or not, all moneys deposited by him on account thereof, or in connection therewith, shall be forfeited to the Crown, and in such case be paid to the credit of the Consolidated Revenue of the Colony. Forfeiture of cash security.

From the records it appears that, consequent on the withdrawal of Bond and Hudson's tender, the Department proceeded to *at once* call for fresh tenders. This and the stringent regulations in paragraph 3 of the tender [see above] are very material points in the consideration of the action of the officers of the Department in returning Bond and Hudson's deposit. 22/7/96.

GEO. C.

10074. You have also prepared a statement with reference to the loss sustained in connection with Contract 79, by letting the contract without re-tendering? Yes; it is as follows:—

## MEMO. No. 10.

*MEMO. B re* the letting of Contract 79 without re-tendering.

Reference is made to my memo. No. 5 on this subject, dated 15/7/96. Clause (a) of that memo. reads as follows:—

(a) Tenders for Contract No. 79 were originally invited for, and received on, 10th June, 1891. The lowest tender was that of Messrs. Bond and Hudson, £36,900 (on schedule prices). The next lowest was Carter & Co's. at £39,890.

The Tender Board recommended the acceptance of Messrs. Bond and Hudson's tender.

Seeing that Bond and Hudson's tender was £2,990 lower than Carter & Co's. the Crown sustained a loss in allowing Bond and Hudson to withdraw their tender. 22/7/96. GEO. C.,

10075. You have also a memorandum in reference to the surrendering of the security to which the Department was entitled under the conditions of Contract 79, and as to the effect upon the security held by the Government? Yes; my memorandum is in these terms:—

## MEMO. No. 11.

*Re* the surrendering of the security which the Department was entitled to under the conditions of Contract No. 79.

(a) The clauses dealing with the security to be given by the contractors for the due performance of the work as specified are as follows:—

In the general conditions, No. 18—

18. *Progress and Final Payments.*

No payments shall be legally due to contractor until after the entire completion of the contract; but progress payments on account, subject to all deductions herein provided for, will be made monthly, or as nearly so as may be, during the continuance of the contract, on the certificate in writing of the Engineer, at rates not exceeding those stated in clause 4 of the special conditions. Monthly progress payments.

The balance of the moneys due for works executed under this contract, less 5 per cent., and less the deductions properly to be made hereunder, will be paid within thirty days, or as nearly as may be, after the Engineer shall have certified under his hand that all the works under the contract, less those of maintenance, have been fully and satisfactorily completed, and that such balance, less the 5 per cent., is due to contractor. Balance.

Provided that, if the amount for maintenance, as entered by contractor in his tender, shall appear to the Engineer to be insufficient, the Minister may retain, on the declaration to that effect in writing by the Engineer, either the whole or any part of the sum otherwise deemed payable to contractor, till all the works under the contract, including those of maintenance, shall have been finally and satisfactorily executed. Insufficient balance.

The said five (5) per cent., together with the "cash security" provided for in clause 20 of these conditions, will be retained until after the expiration of the "period of maintenance" more particularly described in clause 3 of the special conditions, and shall be paid to contractor (less the cost of any repairs or defects, should the contractor fail to execute the same) on the production of a certificate from the Engineer that all the works under the contract, including those of maintenance, have been finally and satisfactorily executed. Final payment.

And part of clause 20:—

Within seven days from the date of notification in writing to any tenderer of the acceptance of his tender by the Minister, the successful tenderer must lodge with the Under Secretary for Public Works the sum named in clause 6 of the special conditions, which sum will be retained as security for the due performance of the contract until after the expiration of the "period of maintenance," and returned to the contractor (if at all) only on the day of final payment, and less any deductions which hereunder may properly be made therefrom. Cash security.

In the special conditions—clause 4 (referring to clause 18 in the general conditions)—as follows:—

*Clause 18 of General Conditions.*

4. The "rates of progress payment" shall be 90 per cent. of the value of work actually done, performed, and delivered, as the Engineer may approve of as fit and necessary for the work.

Clause 5 (referring to clause 20 of the general conditions)—

*Clause 20 of General Conditions.*

5. The "deposit" to accompany the tender shall be as required by clause 20 of the general conditions.

(b) On 23/3/93, Mr. Armstrong, as agent for Carter & Co., applied for a return of the deposit (£2,000), held by the Department. This application was refused. [See printed papers, Nos. 57 and 58, on pages 315 and 316.] The application was renewed by W. Armstrong, 21/4/93, and after it had passed through the hands of various officers, Mr. Hickson added a minute, as follows:—"A voucher has been signed to-day for work done, amounting to £1,453 9s.—R.H., 27/4/93." This minute of Mr. Hickson does not disclose the fact that, in the certificate he refers to, the Department actually returned a portion of the retention-money, viz, £222 17s. 7d., nor does it disclose that, to produce this amount of £1,453 6s., the Department had made an advance on 900 casks of cement at 16s., amounting to £720.

Further, by the ordinary reading of Mr. Hickson's minute, it would not appear to authorise any return of the retention money; but, as he quotes the amount, the certificate must have been before him, and it bears evidence that £222 17s. 7d. of the retention-money had been returned. This

G. Christie.  
22 July, 1896.

(c) This action of Mr. Hickson's is at variance with his minute a month before (25/3/93), on paper 57, in which he says "the contractors have good prices for work done, whereas work to be done is put down at low figures. I cannot recommend that their application be granted.—R.H., 25/3/93." Furthermore, from 10/3/93, to 27/5/93, there was very little work being done on Contract 79, and, as a matter of fact, the value of the work actually done during the period covered by Certificate 13 (27/4/93), was, on schedule prices, only £567 6s. 0d.

It will thus be apparent that the payment of £1,453 9s. 0d. under Certificate No. 13 consists of the following:—

|                                | £   | s. | d. | £      | s. | d. |
|--------------------------------|-----|----|----|--------|----|----|
| Work done .....                | 567 | 6  | 0  |        |    |    |
| Less 10 per cent. ....         | 56  | 14 | 7  |        |    |    |
|                                |     |    |    | 510    | 11 | 5  |
| Advance on cement .....        |     |    |    | 720    | 0  | 0  |
| Retention money returned ..... |     |    |    | 222    | 17 | 7  |
|                                |     |    |    | £1,453 | 9  | 0  |

(d) From and after the passing of Certificate 13 the Department did not retain fully 10 per cent. of the amount of work done, but they returned to the contractors on each certificate the amount of retention money in excess of the sum of £1,989, which was the amount that existed prior to issue of Certificate No. 13. The Department so continued until on the issue of Certificate No. 20 they had returned retention money to the amount of £1,306, as is more fully shown in the following statement:—

RETENTION Money returned prior to completion of Contract 79.

| Date.   | Progress payment No. | Amount of work done to date. | Retention money at 10 per cent. | Actual amount retained. | Difference total Retention Money returned to each date. | Date.    | Progress payment No. | Amount of work done to date. | Retention money at 10 per cent. | Actual amount retained. | Difference total Retention Money returned to each date. |
|---------|----------------------|------------------------------|---------------------------------|-------------------------|---|----------|----------------------|------------------------------|---------------------------------|-------------------------|---|
| 27/4/93 | 13                   | £ 22,118 16 0                | £ 2,211                         | £ 1,989                 | £ 222   | 5/12/93  | 20                   | £ 32,951 14 6                | £ 3,295                         | £ 1,989                 | £ 1,306   |
| 1/6/93  | 14                   | 22,954 10 0                  | 2,295                           | 1,989                   | 306   | 8/1/94   | 21                   | 35,123 6 0                   | 3,512                           | Nil.                    | 3,512   |

| 8/11/93 | 19                   | 30,696 17 0                  | 3,069                           | 1,989                   | 1,080   |          |                      |                              |                                 |                         |   |

GEO. C.

(e) During the same period the Department advanced to the contractors large sums of money on cement, commencing with Certificate No. 13 and ending with Certificate No. 20, and attaining (with Certificates 17 and 18) to the sum of £2,160, as will be seen in the following schedule:—

AMOUNTS advanced on cement, Contract 79.

| Progress Certificate. |             | Amount.   | Particulars.                        |
|-----------------------|-------------|-----------|-------------------------------------|
| No.                   | Date.       |           |                                     |
|                       |             | £ s. d.   |                                     |
| 13                    | 27/4/93 ... | 720 0 0   | 100 per cent. on 900 casks, at 16s. |
| 14                    | 1/6/93 ...  | 720 0 0   | " 900 " 16s.                        |
| 15                    | 5/7/93 ...  | 696 0 0   | " 870 " 16s.                        |
| 16                    | 3/8/93 ...  | 1,360 0 0 | " 1,700 " 16s.                      |
| 17                    | 4/9/93 ...  | 2,160 0 0 | " 2,700 " 16s.                      |
| 18                    | 3/10/93 ... | 2,160 0 0 | " 2,700 " 16s.                      |
| 19                    | 8/11/93 ..  | 1,760 0 0 | " 2,200 " 16s.                      |
| 20                    | 5/12/93 ... | 1,280 0 0 | " 1,600 " 16s.                      |

GEO. C.

As stated in my memo. No. 2 of 8/7/96, these advances were made at the rate of 16s. per cask, whereas the market value did not amount to 11s. 6d., delivered on the works.

(f) A third application was made by the contractors in connection with the return of retention money, namely, in their letter of 28/12/93 (see paper No. 78). The contractors used as an argument for the granting of their request that they were accepting payment in Funded Stock for work on Contract 69, and that they anticipated some trouble would be experienced in disposing of the stock during the first few months. Contract 69 was accepted only the day before (on 27/12/93), but the contract was not signed until 22/1/94; the first payment was £2,610 by certificate of 19/2/94, and the contractors received that amount in cash, and it was not until the certificate of 16/4/94 that they were asked to accept Funded Stock. It might also be mentioned in connection with Contract 69 that the contractors claimed concessions for the acceptance of Funded Stock to the extent of asking that sureties should be accepted in lieu of a cash deposit of £2,260. At the risk of the Department the contractors were thus financially helped to the extent of £5,555.

This third application was made just prior to the issue of Certificate No. 21, and when there was a balance of retention money on Certificate 20 of £1,989. The application was recommended to be granted by Mr. Davis because there was the original deposit of £2,000 still with the Department, and, by Mr. Hickson, because of the condition of their Contract 69 providing for their accepting payment in Funded Stock. The recommendations were approved, "W.J.L., 5/1/94," and the contractors were refunded all retention money in certificate 21. From this date onwards the contractors were paid the amount of the full value of the work at schedule prices, the total further payments amounting to £4,900.

(g) The £2,000 contract deposit had been placed at interest with the Bank of New Zealand, and the term was expiring on 10/6/94. A minute was written on 9/6/94 drawing attention to this fact and asking for instructions. The return of the deposit was recommended by Mr. Hickson, 13/6/94, and approved, "W.J.L., 16/6/94," and the amount was returned to Carter & Co. on 20/6/94.

(h) Mr. Hickson's minute, last referred to above, stipulates that £650 be deposited as security on the further contract, designated 79 A, the tender for which was accepted without competition on 16/6/94. But this £650 had clearly nothing to do with the completion and maintenance of Contract 79, so that the position of the Department was that they had absolutely no security for the completion and maintenance of Contract 79, either by way of contract deposit or retention money, from 20/6/94, other than the £531 10s. 6d., the amount of the final certificate. This final certificate was not given till some four months after, namely, 10/10/94.

(i) Clause 18 distinctly provides that the cash security shall remain until after the period of maintenance. This period was three months, and did not expire until about the month of October, 1894.

GEO. C., 22/7/96.

10076.

10076. You have also a memorandum as to the rearrangement and substitution of schedule items in Contract No. 79, after the Contract was let by the Department, and in connection with which Carter & Co. received payment upon their final certificate? Yes. I have prepared that memorandum up to a certain point; but it is not complete. G. Christie.  
22 July, 1896.

10077. You have prepared it with reference to expert evidence to be given at a later stage? Yes; it is as follows:—

MEMO. No. 12.

Re the rearrangement and substitution of Schedule items, Contract 79.

(a) On page 305 of the Parliamentary Return appears the following paper, numbered 23:—  
Supervising-Engineer Davis to The Engineer-in-Chief for Sewerage.

Minute Paper.

Subject:—Contract No. 79—North Sydney Outfall Sewer.—Driving of Tunnels.

Department of Public Works, Roads and Bridges and Sewerage Branch, Sydney, 19 May, 1892.

THE tunnels from some of the shafts on this contract will be commenced in a few days, and it is, therefore, necessary that it should be settled how they are to be driven, whether with 4-inch charges of compressed powder, 2-inch charges, or without blasting.

With a view of arriving at the method which would give the least annoyance to the residents in the vicinity of the sewer, consistent with economy, I have made comparative estimates.

The excavation by "guttering and gadding" will cost 3s. per cubic yard more than with 4-inch charges of compressed powder, but, as it is impossible to drive the tunnel by blasting to the exact size desired, considerably more concrete has to be used in lining when the driving is done by blasting than when done by "guttering and gadding," and, taking this into consideration, I estimate it will cost about £1,250 less to do the tunnels without blasting compared with doing it with 4 inches of powder.

The 2-inch charges, with the extra supervision that would be required, would be the most costly of any.

I wish, however, to point out that while it would save annoyance and money to drive the tunnels without explosives, it would take longer to do the work.

J. DAVIS.

Messrs. Carter & Co. have undoubtedly fixed their schedule prices speculatively to increase their profits on the contract as much as possible, and, if so, to the loss of the Department. Mr. Davis seems, therefore, justified in the suggestions made, as they would likely cause a saving of £1,000, and clause 55 of the specification is no doubt a saving clause against speculative prices.—C. H. OHLFSEN BAGGE, 19/5/92. The Engineer-in-Chief.

Ask contractors to see me on Thursday morning.—R.H., 23/5/92. Messrs. Carter & Co., 23/5/92.

While I think the Department would hardly be justified in adopting this unusual method of carrying out the work, it is very clear we should aim at getting our work done as economically as possible. Blasting may, therefore, be allowed on the understanding that the average allowance of 4 inches for concrete packing over and above specified size of tunnels be reduced to 2 inches.—R.H., 26/5/92. Mr. Davis.

Contractors informed. Copy of letter attached.—J.D., 27/5/92.

The minutes on this paper settled that most important question whether the tunnels were to be driven by "guttering and gadding" or by "blasting." The original minute is that of Mr. Davis, 19/5/92, in which he practically recommends that the work be done by "guttering and gadding," and points out that there is an estimated saving of £1,250 by so doing. Mr. Bagge's minute, following on the same date, refers to Carter & Co.'s schedule prices as speculative to increase their profits to the loss of the Department, refers to clause 55 of the specification, and supports Mr. Davis's recommendation ("suggestion").

The next minute is that of "R.H., 23/5/92. Ask contractors to see me on Thursday morning." He then, on 26/5/92, writes the following minute, addressed to Mr. Davis:—"While I think the Department would hardly be justified in adopting this unusual method of carrying out the work, it is very clear we should aim at getting our work done as economically as possible. Blasting may, therefore, be allowed on the understanding that the average allowance of 4 inches for concrete packing over and above specified size of tunnels be reduced to 2 inches.—R.H., 26/5/92." In this Mr. Hickson misconstrues Mr. Davis's recommendation, supported by that of Mr. Bagge, and orders that the work be done by blasting. The contractors were accordingly notified, 27/5/92.

In Mr. Hickson's minute, 26/5/92, and in the letter to the contractors, 27/5/92, it is stated as a stipulation that—"The cross-sections will be taken in the usual manner, and you will be paid for the excavation ordered, and for a maximum of 2 inches of concrete lining in excess of the excavation ordered." To this letter the contractors replied on 2/6/92, accepting the conditions, but pointing out that the 2 inches would make a total of 7½ inches, instead of 7 inches as stated in the Department's letter.

(b.) The payment for this extra excavation and concrete is again referred to in the contractor's letter of 10/8/93, the contractors asking for the agreement to be amended in their favour. Mr. Davis's minute thereon, 14/8/93, recommends that the margin of 2 inches be increased to 3½ inches, and Mr. Hickson's minute thereon is as follows:—"The 2 inches was decided upon on the assumption that the average allowance for concrete packing was 4 inches. As it is now stated, this really works out at 5½ inches, Mr. Davis's suggestion is only fair and equitable, and may therefore be adopted.—R.H., 15/8/93." This decision was communicated to the contractors by letter of 21/8/93.

(c.) From a perusal of the specification, and particularly of clauses 58 and 59, I cannot see that the contractors were, in the first place, entitled to the 2-inch margin.

GEO. C., 22/7/96.

10078. *Mr. Parkes.*] In connection with the lining of the sewer there is a further increase to 8½ inches? Yes. I have referred to it, as the matter was again referred to the Department. They wanted the 2½ inches increased to 3½ inches.

10079. In connection with the cement tests, I notice that on 22nd June, 1894, 1,300 casks submitted for test in connection with Contract 79 were condemned—that is, they did not pass the test? That is so.

10080. The certificate is minuted, "In the shed of the contractors." It remained there from June until 23rd November, when it was again tested. There is a minute upon the second certificate to this effect—"Second test of 1,051, after being kept in store on Contract 69 since 20th June, 1894." That would be there from 20th June to 23rd November. The cement then passed? Yes.

10081. Are there any tests recorded in connection with Contract 69 between the dates which I have given you? Yes, there are certain records.

10082. Will you enumerate them? There is a test of fifty casks on the 25th June, 450 casks on 30th June, 400 casks on 6th July, and 390 casks on 9th August, making a total of 1,290 casks tested between those two dates.

10083. That would be all kept in the shed according to the records upon these tests? Referring to certificate 1,071, I should say that the cement was in that case on the contract. That will probably be the case in the other instances.

10084. *Mr. Davis.*] I wish you to refer again to the evidence you have given with respect to the material and labour supplied for the contract at Bondi. In the first place I think you said that the whole of the quantities returned upon the certificate No. 24 under items 43, 44, 46, 47, and 48, were quantities used in connection with the Bondi work? Yes; Bondi and some other contract.

10085. Are you in a position to say that that is a fact? Yes, from a comparison of the items and also the prices.

- G. Christie. 10086. I want you first of all to deal with the question of quantities;—have you gone carefully through the printed papers? Yes.
- 22 July, 1896. 10087. Have you taken out of the list of works given upon pages 321 and 322 of the Parliamentary papers the items you mention as having reference to the work at Bondi? I have not summed them up from the certificates, but I have compared the items.
10088. Would you be surprised to find that instead of the amount chargeable to the Bondi work being £23 5s. 6d., as you supposed to be shown by progress payment No. 24, it is actually £11 1s.? I should. There are a number of small items, but I compared them sufficiently to warrant me in making that statement, I think. But if you will prepare a list I shall be quite prepared to accept it after checking it.
10089. Coming to the question of rates. I think you said that the correct rates according to the schedule attached to the contract for items 43, 44, 46, 47; and 48 were respectively as follow—20s., 14s., 10s., 15s., and 8s.;—will you turn up the schedule and see whether that is so or not? I referred to Bond and Hudson's tender originally, and the figures I have given are taken from that schedule.
10090. But will you look at the schedule attached to the contract? I notice that that schedule does differ from the schedule from which I took my figures.
10091. Is not that a matter upon which you should have satisfied yourself before making a statement of this kind? I took it that one schedule would be the same as the others. I see that Portland cement is put down in the schedule to which you refer me at 16s.
10092. But that is not 20s.? You have paid at 16s. and the price given here is 16s.
10093. *His Honor.*] Where did you get your prices from originally? I obtained them from the schedule attached to the first tender in this contract and the specification issued at the time. How it comes to be altered I cannot say. I took ordinary precautions in making my investigations.
10094. Are not schedules fixed by the contractors in all cases, the quantities being given by the Department? Yes; I see that in this case I am entirely wrong. I find that I have been dealing with a contract in which the schedules had been fixed by the contractors.
10095. There has been a misconception on your part of the form of tender? Yes.
10096. *Mr. Davis.*] Take item No. 44;—what is the rate attached to that? Twelve shillings.
10097. Take item 46? I think if His Honor will allow me to do so, my better plan would be to withdraw this memorandum to correct it. I can hand it in at a later stage.
10098. *Mr. Parkes.*] Does the mistake to which Mr. Davis has directed attention make any great alteration? No. And as regards the quantities, it is for the Department to say whether the quantities, quite irrespective of the price, went to Bondi or not.
10099. *Mr. Gummow.*] You said, I believe, that the Department lost a great deal through Messrs. Bond and Hudson's tender not being accepted? Yes.
10100. Have you read a letter from Mr. Bond which appears upon page 270 of the Parliamentary papers, in which he withdraws his tender? I had read that previously.
10101. And could the Department accept his tender when he had withdrawn it? They could have held him to it.
10102. Will you turn to page 298 of the Parliamentary papers, and read the paragraph referring to the failure of a tenderer to proceed with the contract? Yes. It is as follows:—

Whenever a Tenderer shall fail to proceed with a Contract as aforesaid, fresh Tenders shall be invited at short notice for the work, unless in the opinion of the President there are circumstances which make it desirable for another Tender in the same series to be accepted; but the Tenderer by whose default such a course has been rendered necessary shall be excluded from the competition, and from any competition for other works, at the pleasure of the President.

10103. According to that condition, has not the President of the Tender Board the right to use his judgment in accepting another tender or in calling for fresh tenders? The clause to which you refer me states that the Tender Board have the right to consider the matter at the time, but the position is that the Department allowed one tenderer to drop out and then immediately called for fresh tenders.
10104. The clause contains these words, "Unless in the opinion of the President there are circumstances which make it desirable for another tender in the same series to be accepted." If there were such circumstances the President would have the right to accept the second tender or any other tender? In this case the matter had gone beyond the Tender Board altogether. The Minister decided to call for fresh tenders.
10105. Have you read the whole of the papers in connection with Contract 79? A great many of them. Those with which I have been dealing I have specially read at the time. I could not say that I have read them all.
10106. Will you turn to page 316 of the Parliamentary papers;—you will see upon that page a letter from Mr. Armstrong? Yes. It is dated 31st April, 1893, and is as follows:—

I have the honor to ask reconsideration of your refusal to allow a return of part of the retention money held on account of Contract No. 79, North Shore Sewerage, and to point out that, in addition to deposit of £2,000, retention money now amounts to £2,000, and that Messrs. Carter have plant and machinery on the contract amounting to £3,500, and also materials to the value of £800, making a total security value of upwards of £8,000.

I respectfully submit that the Department will hold very ample security after a deduction of £2,000 from the retention money.

10107. Do you not think that that letter would carry a certain amount of weight with the Department? I am dealing with the exact conditions of that contract.
10108. But are those conditions absolutely binding upon the Department;—if it chooses to make certain alterations, cannot it do so? I would not like to express an opinion upon that point.
10109. Do you know if there are any circumstances which made the Department keep back £1,989 instead of keeping back the full retention money;—do you know of any circumstances which arose about that time which might induce them to give back the £222 you have spoken of, of retention money;—can you tell from the papers which you have read whether there were any circumstances which at that time justified the Department in taking such action? No. The construction I should put upon the papers is rather against it, because the works were not proceeding vigorously. I do not know from what cause the Department would have considered themselves justified in doing what they did.
10110. Do you know that at that time the Department could not get out fresh conditions for contracts? There is a paper upon page 316 which says something about new general conditions.

10111.

10111. Will you read Mr. Hickson's minute, appended to paper 58, upon page 316? Yes. It is as follows:— G. Christie.  
22 July, 1896.

All that contractors would be entitled to if the new general conditions were in force would be £70 19s. 5d. As these are not yet in force, and contractors have good prices for work done, whereas work to be done is put down at low figures, I cannot recommend that their application be granted.—R.H., 25/3/93.

10112. Do you know whether it was not considered at the time that when the total amount of retention money and the deposit amounted to 10 per cent of the contract all accruing retention money should be returned to the contractors? I had not read that.

10113. *Mr. Davis.*] I suppose that, when writing your statement with regard to rearrangement and substitution of schedule items in connection with Contract 79, you based it upon what you gathered from the Parliamentary papers? Yes.

10114. Will you tell me upon what you based this statement, "The payment for this extra excavation is again referred to in the contractors' letter of 10th August, 1893"? I think your original letter says that.

10115. Is anything said there about extra excavation being paid for? I interpret the reference there as being made to extra excavation. That is the clear conclusion I derive from it.

10116. You would conclude from the letter upon page 305 that only 2 inches of concrete lining in excess of the excavation ordered is to be paid for, and that the extra excavation is to be paid for in addition? That is my clear deduction from that letter.

10117. Does it state that? Yes.

10118. Will you point out where? It says in excess of the excavation ordered.

10119. Is it stated that extra excavations are to be paid for? I read it so.

10120. Will you point out to me where it says that extra excavation is to be paid for? That is what I interpret the clause to mean. If you refer to paper 65 upon page 317 you will find these words:—

The 2 inches referred to was fixed as being 2 inches less than usually works out as an average cross-section, but owing to the foregoing reason, and to unavoidable errors in the alignment, we ask to be allowed cross-sections equal to those of Contract No. 53, less the 2 inches which was intended to be deducted.

10121. Reading that paragraph with the context, would you take it to mean what you say? Yes.

10122. Will you read the first paragraph of the letter? Yes.

Referring to our letter of 2nd June, 1893, in which we accept a maximum thickness of 2 inches over plan dimension as the quantity to be paid for lining tunnel on Contract No. 79, North Sydney sewerage, we beg to state that this was agreed to on the supposition that the ground would admit of such dimension being practicable.

They go on to say that it is not practicable, and they want more measurements.

10123. But is anything said there about extra excavation? Certainly. Otherwise what do they mean by cross-sections. It shows that they wanted larger cross-sections, I think.

Joseph Davis, recalled, and further examined:—

10124. *Mr. Parkes.*] What is the course which the Department follows with regard to the testing of cement stored upon works? The contractors when they have a whole parcel in the shed generally apply to the Inspector or to the Resident Engineer for samples to be taken. J. Davis.  
22 July, 1896.

10125. But what is the course followed when the cement is put upon the job—is it kept in a shed? Yes.

10126. Is that shed always locked? No it is not. It could be locked in the evening; but they would be taking cement out of the shed probably most of the day.

10127. Who has charge of the key? In some cases we have, but not in every case.

10128. Is it not a regulation of the contract that the Inspector or Supervising Engineer shall have charge of the key of the cement-shed? I am not sure that it is. I believe that is so in the case of some contracts, but not in the case of all. I should have to look up the particular contract to which you refer.

10128½. Is it not a general regulation of the Department? I do not think it is. I have had it in cases where I have been suspicious—that is, I have had the key kept by officer on the work, because his duty is to visit the shed once, or, if necessary, oftener, during the day, and he would keep a tally of the cement in that way. He would be able to tell at once if anything were going wrong.

10129. Do the Inspectors send in every day a return of the casks used? At one time they did. They do not now.

10130. When did the change take place? First of all it was the custom for many years to keep in a book the quantity of cement used on a contract. That was right enough, but I adopted a system about four years ago under which the inspectors were to report to me each day. In their report they would give the number of casks used during the day, the number of men employed, and other tabulated information which we record in the office. I gave up charge of the sewerage works in April of last year, and that practice was then discontinued.

10131. What did you do with the returns when they came in—did you file them? They were not filed exactly, but they were put away for future reference.

10132. Have you them now? They are in some place or other. I dare say they could be found.

10133. Would they have to be searched for? I dare say I could put my hand upon some of them almost immediately.

10134. For how far back could you put your hands upon them? I could not say at this moment.

10135. Would it be for five years? The system was not in existence for that period. There might possibly be three years. Some might be missing and we should have to look for them, but that could easily be done.

10136. After you left your position in April, 1895, you still had a close connection with the sewerage contracts, had you not? I had nothing whatever to do with them.

10137. Have you not control of them now? Yes; since April of this year.

10138. For twelve months you had not control of them? No.

10139. What is done now in regard to the quantity of cement used—is the same course followed that was followed previously? I intend that it shall be so. I drafted a day or two ago instructions resuming the old practice. I believe in it.

10140. Will you tell His Honor what course has been followed in the interim? I believe a weekly report has been sent in.

10141. Are the reports in existence? I believe they are.

10142.

- J. Davis. 10142. They can be obtained? I believe so.
- 22 July, 1896. 10143. I believe you have already said that it would be impossible for cement to be sent to the work without the inspector knowing it? I do not think I have given any evidence upon that point.
10144. Would it be possible for cement to be used in the works without the inspector knowing it? No; I do not think so. It certainly would not be possible if the inspectors were doing their duty.
10145. Of what capacity are the sheds in question? They vary with the size of the contract. It depends entirely upon the quantity of cement which would require to be stored. We ask the contractors to keep enough cement in stock for (say) fourteen days ahead, or something of that sort.
10146. How do you regulate the quantity—are you guided by the extent of the contract? Yes.
10147. What quantity would be necessary in the case of a £20,000 contract? It would depend upon the nature of the contract. For instance, it might contain a good deal of concrete work, but it is a matter of calculation. It can easily be arrived at.
10148. But cannot you say, roughly assuming that you were carrying out an ordinary sewerage work, such as you are in the habit of carrying out? Say that one-half of it would be concrete work, that would mean (say) £10,000 in twelve months or £800 a month for concrete. That would represent (say) 400 or 500 casks a month.
10149. Then if it were a £45,000 contract the capacity would be about a thousand casks? It would depend, as I say, upon the quantity of concrete.
- 10150-1. Take an ordinary construction such as contract 69, the capacity of your shed would be about a thousand casks would it not? I should say there would have to be shed room upon the contract—in two or three sheds perhaps—equal to that if the contract were to go on without cessation.
10152. Is there more than one shed upon these works? I am not sure; I think there would be two.
10153. Two upon one contract? I am not sure. I could not say positively.
10154. Do the inspectors count the casks in the morning? No; they do not count the casks every day, but they know precisely how many casks would be used during the day. Suppose the contractors had been working three days and had used 60 casks, the inspector would be able to tell by looking into the shed and counting up the casks whether the quantity was correct.
10155. Therefore the most careful control is kept by the inspectors of the department over the quantity of cement? Yes.
10156. Take the quantity of cement which was allowed to remain in the contractor's shed upon contract 69, and which did not pass the test, it was allowed to remain there for a very long time? It appears to have been there from June to November.
10157. In the meantime would the inspector have control of the shed;—would he have the key or would the contractors have it? It is possible that the contractors would have control of the cement from June until it was retested, or until samples for retest were sent in in November.
10158. Is not that your initial at the bottom of the certificate? It is my name.
10159. All through these certificates bear your name? They are issued to me.
10160. You have control of the cement tests? I have.
10161. Would it not be your duty to see that this cement was taken charge of by one of your officers? Not in this case, and I will explain why. The cement would be sent in for testing, simply. The test in June would be made up to twenty eight days. If, at that time, the cement did not comply with the prescribed test, it would be condemned. In this case I see the cement was rejected at seven days. That is marked in the corner of the certificate. The contractors, believing that the cement would improve by keeping, would ask, in the ordinary way, to have the parcel retested in November. Fresh samples would then be taken and submitted to the usual test. The final certificate shows that the cement had improved, and that it was eventually accepted.
10162. If you have not charge of the key, what would there be in the meantime to prevent that cement from being used, and fresh cement being put in its place? First of all as to using it. The inspectors are on the ground the whole of the time, from the time the work starts in the morning until it is concluded in the evening. It is their duty to know what cement is being used. They know, therefore, whether the cement is approved or otherwise. If this cement were rejected in June, it would not be used. Then as to the cement being changed during the period which elapsed between June and November, that, as far as we are concerned, would not matter in the slightest degree. The test of cement in June stands upon its own merits, and speaks for itself. As it happened, the cement was rejected. The test for November, again, stands on its own merits, and it does not matter whether the same cement was tested in November as was tested in June. The cement tested in November was approved. That is sufficient for us.
- 10163-4. How many casks would be tested out of the 1,300? The practice is to take four samples in every hundred.
10165. So that the inspector must have definite information as to the number of casks on the job? They have definite instructions as to the way in which they are to take samples.
10166. Have they not definite information as to the number of casks on a job if they take four samples in every hundred casks? When they send in the particulars which are wanted at the head of each test they should certainly send them in accurately. If they do not do so they are to blame.
10167. Is it not set forth in your specification that rejected cement shall be immediately removed from the works? That is so.
10168. Is that not carried out? In a case like this the cement would scarcely be described as being on the work because it was in the contractors' shed—on private property, quite by itself, as far as my recollection serves me.
10169. Was it on private property? On property which the contractors rented, I believe.
10170. The Government advanced money upon the cement, did they not? Not on this cement, I think. In any case it does not matter, because we took the usual agreement.
10171. As to Contract 118, the cement of John Try, in bags, was condemned? A portion of it.
10172. A good portion of it? I could not say what proportion, but I know that a portion was approved.
10173. Some thousands of bags were condemned? I could not say. I see from the test book that 1,350 bags were submitted for test on 5th December, and apparently did not comply with the test.
10174. In January, 1896, 2,000 bags were also rejected? Yes.
10175. That accounts for 3,350? Yes.
- 10176.

10176. Why was that cement not removed from the work? As far as my recollection serves me, the cement was kept on the works with a view of retesting. There is a good deal of colonial cement which does not pass the test when it is delivered on to the work in the first instance, but which, when it has time to mature, does pass. The same thing holds good with regard to imported cement, but not to the same extent.

10177. You will see that it was held for about three months, and that, when it was tested on 12th February, it gave the worst results, viz., 148 lb., whereas the minimum is 200 lb.; it apparently diminished in strength by keeping; I am referring now to the twenty-eight days' test? It would appear from the book that on the 12th February 1,500 bags were re-tested. I should judge that this quantity was made up from test 1,333 and some other cement.

10178. You heard the evidence of your tester, who said that it would not stand the test, and was, therefore, rejected? I know that that is the fact.

10179. Then why was it left on the job;—is it not on the job at the present day? The work is finished.

10180. Why was it not removed from the job when it was condemned? My impression is that another test was made after that.

10181. Ought it not to have been removed from the works? It did not much matter in this instance, because the work is finished. It has been practically finished since about March, and this certificate would not be through until the end of that month.

10182. Was there not a good deal of cement work going on? The whole of the concrete work was finished in March.

10183. But it had to be cemented all over, had it not? Nearly 95 per cent. of the rendering had been finished at the time this test would be only just through.

10184. Will you produce for the use of the Commission the reports of your inspectors in regard to the cement used upon Contracts 69, 79, and 79A? Yes, with pleasure, if His Honor will direct their production.

10185. *His Honor.*] I suppose they can be produced without any great difficulty? I think so. I will do my best to let Mr. Parkes have them at the earliest possible moment.

10186. As you were not in actual charge of the sewerage works at the time, you cannot say why the cement of John Try was not removed? I know that the reason I have already given is the correct one—that is to say, that the contractors kept it there with the idea that it would mature. When it was brought down from Merrylands and put into the shed it had only just been made, and it frequently happens in the case of colonial cement that when it has been kept for two or three months it parts with a certain proportion of free lime, or rather the free lime slakes. The cement then stands the test. That would be the object of keeping the cement there. It really should have been stored at the cement works. But it was brought into the sewerage works, I presume, because Mr. Try thought it was in proper condition. It was found that it was not. We had to speak definitely upon that point after the first test—that is, had to say whether we would accept it or reject it. We could not accept it, and the contractors ran the risk of having another test made; keeping the cement in stock, I presume, with a view to its improvement.

10187. Can you say whether, in fact, any bag cement ought to have been used at any time during the course of this contract? Yes, I think so.

10188. What bag cement would it be? John Try's; some of that was approved, to the best of my recollection.

10189. You believe that some of John Try's cement was passed? Yes. I may explain in reference to what the witness Dawson has said on two or three occasions—Mr. Parkes can call the Inspector if he chooses, and he will find, I think, that this is the case—that it was directed that the casks of which Dawson spoke as having been filled should be filled in that way. Carter, Gummow, & Co.'s foreman asked the Inspector if he might leave intact a few casks, as some of the bags of cement had got damaged, and the cement could not be brought down on to the works in them. The Inspector reported to me that he allowed it, as he thought it a reasonable request. The casks were taken into the shed to be filled, in the way described, from approved cement.

10190. *Mr. Parkes.*] But was not that cement condemned in December? I cannot give you the dates. I can only tell you what was reported to me. [*Vide Appendix No. 38*]

10191. *His Honor.*] That would be the only legitimate reason then for putting bag cement into casks? There could be no other reason.

10192. For measurement it would be useless? Three bags would go to a cask. I suppose they would put three bags into a cask and then take the cask down to the work. The inspector will be able to tell you what happened.

10193. Is John Try's the only bag cement which is used? Goodlet and Smith also have some bag cement. I was not sure in this case whether the cement was Goodlet and Smith's or Try's.

10194. Would the bags of cement be marked? No, it is difficult to mark the bags.

10195. They would not be branded? No. When we approve of bagged cement we have to watch it.

10196. Then the same shed might contain cement in bags which had been rejected and other cement in bags which had been approved? They would be in different parts of the sheds. The inspectors have specific instructions not to allow condemned cement, or cement under test, to be mixed with approved cement—for instance, the door would be in the centre of the shed, and probably the approved cement would be upon one side of the door, and the cement under test would be on the other side, supposing both descriptions of cement were in bags.

10197. The key you say is not always kept at night by the inspector? Not always. In some cases where we have special reason to be careful that is done, but it is not the usual practice.

10198. What I understand you to say, then, is this—that you trust to the honesty of the contractors or of their foreman unless you have reason to doubt their honesty? We necessarily trust them to some extent. At the same time, the cement, from the time it is approved until it is in the work, is under constant supervision. The inspector is on the works the first thing in the morning, before work starts, and he is able to see whether the cement has been tampered with in any way during the night.

10199. Unless any bags have been shifted during the night? Even then he could tell from the general appearance of things, whether it was so or not. He could tell not only from the heap of approved cement being incorrect, but also from the heap of cement under test being decreased.

10200.

J. Davis.  
22 July, 1896.

- J. Davis. 10200. *Mr. Gummow.*] Do you know how the contractors buy their cement;—have you ever heard that they buy it absolutely from the merchants or importers, or whether it is bought subject to approval? I know as a matter of fact that the risk is far too great for the contractors to buy cement approved or not approved. They always stipulate—at least, so I am informed by contractors who have worked under me—with the merchants that they only buy approved cement, and if the merchant delivers cement upon the works and it is eventually rejected he will not only have to take the cement back but to bear the expense of carting it there and back. As a consequence they have to pay a higher price for the cement. The contractors tell me that that is the cheapest way for them to do their business.
10201. So that it is of no advantage to the contractors to use condemned cement so far as they are personally concerned;—the risk is the risk of the importer or the manufacturer? Entirely.
10202. It is clearly stated in the specifications that after cement has been condemned it is not to remain on the works longer than twenty-four hours;—is that specification absolutely carried out? It is like a great many other conditions of that description imposed by the Department. It is put into operation if necessary—that is, if it is to the interest of the Department to put it into operation. There are a great many laws which are not put into operation to-day, although legislators have made them.
10203. A certain amount of judgment is used by the Department in carrying out these clauses? Yes. If we saw that a contractor desired to do what was right and reasonable, we should endeavour to meet him.
10204. You apply, not only to Carter, Gummow, & Co., but to any other contractors any fair condition;—you do not allow these concessions to Carter, Gummow, & Co. exclusively? It might be very unreasonable to put this clause into operation. For instance, the cement might be condemned on a Saturday and we could not expect the contractor to cart it away on the Sunday. Forty-eight hours' notice in that case would have to be given.
10205. But do you or do you not draw any distinction between different firms of contractors in making concessions? I have only one answer to give to that. I endeavour to administer the specification, whether to one man or to another, as evenly as possible.
10206. You use your judgment;—you act according to the circumstances of the case? Yes. With regard to cement remaining upon contracts, take the case in which John Try's cement had failed to pass the twenty-eight days' test. Supposing it had not been tested before, and had just been brought from Merrylands on to the sewerage works—if it suited the contractors to ask that it be allowed to remain a little time to mature, that would be a most reasonable request to make, and one which the Department would consider. If that were not done, in nine cases out of ten it would mean that colonial cement could not be used.
10207. Have you ever allowed any other contractors to have cement re-tested? Yes.
10208. So that this particular concession, or whatever you may choose to call it, has not been limited to Carter, Gummow, & Co.? I have no particular liking for Carter, Gummow, & Co.
10209. You do not give them any more concessions than you would give to any other firm? I believe I do not.
10210. I think you might say that you do not? You want me to say that I am an impartial judge—that I am not human nature.
10211. But are you particularly partial to the firm of Carter, Gummow, & Co.? If I know myself I certainly am not. What others might think of my action is another thing.
10212. In your own judgment and action are you impartial or not? I believe myself to be so.
10213. *Mr. Parkes.*] The items, in the list I hand you, you recognise as having been in connection with the Bondi contract? Yes; the items upon that slip are for material and the cartage of material between North Shore and Bondi.
10214. These are items, which you have pointed out, which were expended in connection with the Bondi works, and charged to Contract 79? Yes. [*Vide Appendix No. 39.*]
10215. As far as you know, that is a complete list? Yes; those are the only items charged in that contract for work done at Bondi and for material used there.

George Christie re-called and further examined—

- G. Christie. 10216. *Mr. Parkes.*] You have amended your memorandum in reference to certain claims included in payments on Contract 79, which were properly chargeable to the Bondi contract? Yes; it now reads as follows:—

MEMO. No. 8.

Re certain claims included in payments on Contract 79, which were properly chargeable to the Bondi Contract, &c. ON pages 321 and 322 of the Parliamentary Return there are lists of certain amounts claimed by Carter & Co., which are evidently not chargeable to Contract 79, excepting possibly in one or two instances; but which Mr. Boys, the resident engineer on Contract 79, was instructed by Mr. Davis (minute, 14th December, 1893), to include in the next progress return of that contract. There is a further minute as follows:—“The fares\* had better be ‘returned’ under the item of ‘dray, &c.’ in schedule.” Mr. Boys appears to have again asked for instructions on 19th December, 1893, and Mr. Davis to have confirmed his previous instructions on 20th December, 1893.

Thomas William Bryant recalled and further examined:—

- T. W. Bryant. 10217. *Mr. Parkes.*] Will you look at the document I now hand you in connection with the construction of a Monier culvert on the Main Western Road near Ormond-street;—will you explain the minutes upon that document as briefly as possible? Yes, it is a minute by Mr. W. A. Smith, recommending the expenditure of £123 10s. for the construction of the culvert. Mr. Hickson asked Mr. Smith to see him on the 25th July, 1894, and subsequently Mr. Hickson approved, when it was noted by the Accountant that funds were available, reference being at the same time made to paper 94-5580 as to royalty which was to be paid to Carter, Gummow, & Co. It was then asked whether the work was to be done by day-labour or by contract. Mr. Smith in reply to the query said that the work was to be carried out by day-labour. The papers then came round to Mr. Symonds. Mr. Smith, I think, must have been away, and it would be usual in such cases for me to send the papers to Mr. Symonds. I see a pencil note on the paper for Mr. Symonds to see to the matter, and Mr. Symonds has written, “Seen and noted.” The papers were

\* NOTE (on revision):—Printed in error “fines” on page 322 of Parliamentary return.—G.C.

were then brought back to the Records. The Record Clerk says that he received them from Mr. J. T. W. Bryant, Symonds, and Mr. Smith then recommends that the work should stand over until 1895.

10218. Do you know whether Mr. Symonds complained of the money being taken out of his Road Vote? 22 July, 1896.  
Yes; he came to Mr. Smith about it.

10219. Is that the reason why the Monier culvert was not constructed at Ormond-street? Yes; Mr. Smith called me in, and wanted to know why I had sent the papers to Mr. Symonds without authority. As a matter of fact, that was not the case, because I had authority to do so when Mr. Smith was away. He was annoyed, and said that he did not want Mr. Symonds, senr., to have anything to do with that work, and that it was work for Mr. Symonds, junr., to do. In the meantime Mr. Symonds and Mr. Smith had a discussion as to the taking of money from the Main Western Road Vote.

10220. If Mr. Symonds had raised no objection the work would have been done without ministerial approval, would it not? Yes.

10221. Will you explain how the vouchers are signed and countersigned before they go to the account proper to which they should go? Take voucher No. 115 for example. Mr. Symonds signs in the first instance, and the expenditure is approved by Mr. W. A. Smith.

10222. And so also with regard to voucher No. 516? That contains the same signatures.

10223. The same thing applies to all the vouchers from which you compiled your statement as to the cost of the Monier street-culvert at Strathfield? Yes. Wherever the culvert is not specifically mentioned on the vouchers we reject them.

10224. The whole of those vouchers bear the signatures of Mr. Symonds and Mr. W. A. Smith? Yes.

10225. There are also clearly marked upon the vouchers the material, the place to which it was sent, and other indications from which it can be gathered that the vouchers apply to the Monier culvert at Strathfield? Yes; and Mr. Smith approved of the payment in each case.

10226. Since Mr. Smith gave his evidence the other day you have again gone through these vouchers to see that they are all signed by him, and that the whole of the labour and material which they include was properly included in your total? Yes.

10227. Have you seen any reason to alter your evidence? No.

10228. The whole of these amounts must go to the general account in connection with the Monier culvert, you think? Yes.

10229. The whole of these vouchers would go to the Auditor-General as accounts in connection with this culvert? Yes; the vouchers speak for themselves. A large amount of money is appropriated annually in connection with the Main Western Road, and it was for Mr. Smith to say whether he considered that the charges in connection with this particular culvert should be made to that account. In this case the vouchers are specially marked in connection with the material and labour put into the culvert, and in each case the voucher is signed by Mr. Smith.

10230. You have looked over the papers in connection with the Callan Park grant? Yes.

10231. What was the actual amount expended there? I endeavoured to get the papers yesterday, but I could not get them. I should think the amount expended would not exceed £450.

10232. Then only about one half of the money which was voted was used? Yes. The balance must have been taken for other purposes. Otherwise where has the money gone to. I could not get at the particulars yesterday, because I could not get the books I wanted.

10233. What prevented you from getting the books? Yesterday evening, when I was in the strong room, there was an objection raised to my being there, although I had an officer of the Department with me. They said that until the Under Secretary gave the necessary permission they could not permit me to stay in the room.

10234. Was the room in confusion? Yes; it was in a disgraceful state. The whole of the books were on the floor, and the whole place was in darkness.

10235. *Mr. Norrie.*] With regard to vouchers which you say are all in connection with this culvert, will you look at voucher 201? Yes. It is headed, "Roads Department—Iron Cove Bridge," but that voucher was written by John Keep and Co., and not by the Department. Mr. Bramston, I see, was asked whether the amount was correct, and he said it was, and the amount was entered as having been used upon the culvert.

10236. Then take voucher 389 for five casks of cement, which is marked "Iron Cove Store"? Five casks of cement were taken straight on to the works, and other casks went to the Iron Cove Store, until the carter had time to bring them out. I know that it came out because Larkin loaded it up.

10237. Do you know that he did so? Yes, he told me so.

10238. Then take voucher 191—that is headed "New Zealand Timber Co."? Yes; but at the top of the voucher you will see "Culvert at Burwood, Main Western Road." The timber was made up at the Iron Cove Store as has already been explained.

10239. Do you know that of your own knowledge? Yes.

10240. Then as to voucher 208? That is a similar case. The Iron Cove Store is where the wood-work was prepared. Mr. Smith has signed the voucher as correct, and it is headed "Culvert at Burwood."

10241. Do you know how much timber was used in the construction of the culvert? No; that was no part of my business. My business was to see that the money was forthcoming.

10242. But your evidence is that this timber was used in the construction of a culvert? Mr. Larkin and Mr. Bramston would be the two officers who looked after that matter, but Mr. Smith by his signature distinctly says that the timber was used in the culvert. I presume he would not sign a document in which it is distinctly stated that the timber was so used unless he were convinced that that was the case.

10243. Look at voucher 323—you will see that Isles is paid for carting two kegs of powder and fuse to the Five Dock quarry—is that properly charged against the Monier culvert? You will find an item of £1 in that voucher for the carting of goods to the culvert. We took only £1 out of that voucher. The signatures of Mr. Symonds and Mr. Smith also appear upon it in endorsement of what I say.

10244. As to the Ormond-street culvert do you know the reason why it was not carried out? I know that Mr. Symonds and Mr. Smith had an argument. I remember Mr. Symonds saying that he could not possibly spare the money.

10245. It was not that they could not put in a Monier culvert in that position? No, as far as I can remember it was a simple question, of funds. Mr. Symonds objected, and in that case it went before Mr. Hickson to apply to the Minister for funds, but he apparently did not think that a prudent course.

- T. W. Bryant. 10246. Do you not know that the Commissioner for Roads, under the Main Roads Act, has the sole management of the funds for the roads? I remember being asked to see Mr. Carroll and to ascertain if it would not be possible to get some money advanced from the advance vote, and I recollect his saying that the vote was exhausted.
10247. You do not know, however, that the vote was exhausted at that particular time? No.
10248. *Mr. Gummow.*] Is there a voucher among those to which you have referred for £2 5s. royalty to Carter, Gummow and Co.? No. The papers attached to the Callan Park work show that a royalty was approved by Mr. Scarr.
10249. Is there a receipt for it? I only saw the papers. Whether the amount was paid or not, I do not know.
10250. *His Honor.*] You say you have gone through all these vouchers again? Yes.
10251. Can you discover any error of any kind in your calculation? No; they are correct. There is no getting away from Mr. Smith's certificate in each case. I see from the evening newspapers that he said that he had supervised the work. I know that he handed over the work to Mr. Symonds, senior, and Mr. Symonds, senior, paid the wages; and I have never known Mr. Symonds, senior, to sign a voucher until he was distinctly aware of the nature of the service which had been performed. If he signed these vouchers for wages in connection with the Monier culvert, you may be sure that he was in possession of facts which justified him in doing so. He must have been clearly satisfied that the work had been performed upon the culvert.
10252. With regard to Mr. Bramston's salary for supervision? I am positive that Mr. Symonds must have been satisfied that Mr. Bramston was there all the time. That would appear to be the case in these vouchers, which are also signed by Mr. W. A. Smith as being correct. As the work was one which Mr. Smith considered was being carried out economically, I do not think he would sign for any money unless he was satisfied that it was expended in connection with the work. The vouchers for June and July contain amounts for £15 12s. each for Mr. Bramston's wages or salary, and Mr. Smith certifies that the amount is correct.
10253. Mr. Smith made a deduction of a considerable number of days upon which he said Mr. Bramston was not employed upon this culvert? I should like to know how he arrived at the information.
10254. That is a matter which you do not understand;—you simply take the vouchers as they stand? Yes.
10255. *Mr. Norrie.*] Do you know whether Mr. Bramston did or did not at this period supervise several other works? I cannot say as to that, but Mr. Smith, by his signature, certifies that the voucher is correct.
10256. If Mr. Bramston had been employed upon several other works at the same time, would his salary be split up into several vouchers? That could be done.
10257. But is it the practice;—you had charge of the financial part of the works, you say, and I want you to tell us what was done? The practice would depend upon whether we had the money. In some cases where we have not the necessary money to finance a work the vouchers are split up and are charged to several votes.
10258. Who prepared these vouchers? Mr. Benson, of Parramatta.
10259. He is in the office? He would be going backwards and forwards. Mr. Symonds would be responsible for each amount.
10260. Is it not possible that Mr. Benson may, as a matter of convenience, knowing that Mr. Bramston was engaged upon other works in the district, have put the whole of the amounts into one voucher instead of making up vouchers for the number of days work in connection with eight, ten, or a dozen contracts;—is it not the practice to make up only one voucher;—has it not been done repeatedly in other cases? I could not say. I know that as far as Mr. Symonds is concerned, he never did so. He never put his name to a voucher in connection with any work unless he was satisfied that the claimant had performed the work.
10261. But you have done so, have you not? Under Mr. Smith's instructions.
10262. Mr. Smith was carrying out this work? No. Mr. Symonds, senior.
10263. I thought you said that Mr. W. A. Smith supervised Mr. Symonds, senior? That is as far as the district is concerned.
10264. Did Mr. Symonds, senior, pay daily visits to the work? He would be riding backwards and forwards, I suppose.
10265. He would know whether Mr. Bramston was supervising the work? He must have been satisfied that the work was performed by Mr. Bramston or he would not have signed the voucher. He has never been known by the Department to deviate from the actual facts in any case of the kind. He must have been in possession of the facts before he put his name to the voucher. Besides, Mr. Smith endorsed it as being correct.
10266. *Mr. Davis.*] Surely Mr. Smith, as the supervising engineer, would have some knowledge as to where Mr. Bramston was engaged from day to day? Sometimes Mr. Smith would be away at Gosford or Wollombi for a fortnight at a time.
10267. But he would not be away for two or three months? No.
10268. *His Honor.*] Sometimes, I suppose, Mr. Symonds would be up beyond Penrith in that part of his district? Yes; he would be going backwards and forwards on the road.
10269. Did the son act as *locum tenens* for his father? No; Mr. Smith had him in his office in Sydney.
10270. If Mr. Symonds, senior, were away upon another part of the road, who would be looking after this work? Mr. Symonds, junior.
10271. Would Mr. Symonds, senior, give notice that he would be away? Mr. Symonds, junior, would be living with him in Parramatta, and would always know his father's movements.
10272. *Mr. Davis.*] Is it not a fact that Mr. Symonds, junior, was not working immediately under Mr. Symonds, senior, and had nothing whatever to do with his father;—did he not, in point of fact, carry out this work immediately under Mr. Smith, without reference to his father? No. The vouchers show that Mr. Smith's instructions to Mr. Symonds, junior, were to write out the vouchers and take them to his father. He said that he would endorse them afterwards.
10273. But that does not refer to the work; it refers to the vouchers? I do not know what arrangement there may have been between Mr. Symonds, senior, and Mr. Symonds, junior. There may have been some verbal understanding; but we regarded Mr. Symonds, junior, as operating from our office for the time being.

10274. Immediately under Mr. Smith? I should say that in this work he did a portion under Mr. Smith and a portion under his father. T. W. Bryant.

10275. If Mr. Symonds, senior, said that he did not supervise this work himself, what would you say as to that? I could not speak definitely as to the supervision of the work. That would be dragging me out of the office. 22 July, 1896.

10276. Has not Mr. Symonds, senior, said in his evidence that he was at the works twice a week, and is not that rather different from what you thought to be the case? I thought he would be going backwards and forwards; I could not say that he would be always on the work. My work was in the office. I heard the arguments which took place as to this particular culvert when the men came there.

10277. I suppose the visits Mr. Symonds paid to the work would be casual visits upon his ordinary rounds;—there would be other matters which he would have to look after at the same time? Probably.

Joseph Davis recalled and further examined:—

10278. *Mr. Norrie.*] Will you tell His Honor the reason for the material, to the extent of £11 ls., going to Bondi? There was a culvert over the Old South Head Road which required to be repaired. I was instructed to do the necessary work by day labour. We had no plant, and I arranged with Carter, Gummow, & Co., who were doing work at North Shore, to lend us what we required in the way of plant. They were the nearest contractors to the culvert in question, and, when the plant was being carted across to the culvert, we got with it a small quantity of cement. The cartage charged for is principally the cartage of plant from North Shore to Bondi, and from Bondi back to the contractors' works at North Shore. That is the whole explanation of the matter. It was a convenience to get the plant from these contractors, and it was also a matter of convenience to get approved cement. J. Davis. 22 July, 1896.

10279. Would you vouch for the correctness of the inspector's returns of cement which Mr. Parkes has asked for in regard to Contracts 69, 79, and 79 A? I should say they would be only approximate, and for this reason: It is usual on contracts like 69, 79, and also 79 A, to some extent, where concrete and brickwork is being carried out, to have one principal inspector. The brickwork and concrete may be going on in five or six places at the same time; that is, on different parts of the contract; and the custom of the Department has been to station at these five or six places sub-inspectors or overseers. They would keep an account of the cement that is used, and hand it to the principal inspector in the evening. He then makes up the return, so that you could scarcely make one man responsible for it, although, as a matter of fact, one man makes it up. The man who attaches his name to the return is nominally responsible for it, but I should not like to make him responsible for the accuracy of it, and for that reason I should not like to say that in every case the return was accurate. I should prefer to call it an approximation.

10280. You have to depend to some extent upon your overseers? Precisely. We have to depend entirely upon them in this matter.

10281. *His Honor.*] You try to get reliable men for those positions? We believe we have reliable men. I do not believe they would make false returns. Everyone is liable to make mistakes. We find that even Mr. Christie is liable to do that.

FRIDAY, 24 JULY, 1896.

George McCredie recalled and further examined:—

10282. *Mr. Parkes.*] You have made a report in conjunction with Mr. Thompson concerning your tests as to the quantity of cement contained in concrete of various descriptions as provided by the specifications on Contracts 79, 79A, and 69? Yes; it is as follows:— G. McCredie. 24 July, 1896.

Varney Parkes, Esq., M.L.A., Public Works Inquiry Commission, Sydney.

Dear Sir,

250, Pitt-street, Sydney, 23 July, 1896.

Acting on your instructions, we have made tests as to the amount of cement required per cube yard of concrete, following the Sewerage Construction Department's specification as given in the printed papers.

In making the tests we used three boxes each, 4 ft. 6 in. by 4 ft. by 1 ft. 6 in. deep, holding, when full, 1 cube yard, and for the purpose of gauging a box 4 ft. by 12 in. by 12 in. The broken stone was first tested as to gauge, then roughly washed, as specified, and forked into the 4-ft. gauge-box, and from thence deposited on to a hardwood platform, then we added the proportionate quantities of sand and cement, and the whole was turned over twice dry and twice wet, and deposited in the boxes before mentioned.

We may state that these tests were made in the presence of Messrs. A. L. McCredie and Geo. Donald, in addition to ourselves, and every dimension and proportion were carefully checked by each.

The mixing was done by two expert labourers, the whole of the operations being carried out under our joint supervision.

*First—Sandstone Concrete.*—Proportions specified, 1 cement, 2 sand, 5 stone, 2-inch in gauge. For this test we used the following quantities:—Half a cubic yard of stone, 5·4 cubic feet of sand, and ·675 of a cask of cement. These quantities, when placed in the large box, made only half a cubic yard of concrete, showing the total disappearance of the cement and sand. Upon being subjected to a moderate ramming, as specified, this half a cubic yard sank half an inch, or a total actual shrinkage of one-eighteenth in bulk, thus showing that in concrete of these proportions the interstices must be considerable.

*Second—Blue-metal Concrete.*—Proportions specified, 1 cement, 2 sand, 4 stone, 1½ gauge. The quantities we used in making this test were as follows:—Half a cubic yard of stone, 6·75 cubic feet of sand, and ·843 of a cask of cement, which when being placed in the large box only filled it to a depth of nine inches, showing, as in the case of the sandstone concrete, that the sand and cement disappeared, and on being rammed moderately, as per specification, it further sank a quarter of an inch, thus resulting in a decrease in bulk of one thirty-sixth.

*Third—Special Bluestone Concrete.*—Proportions specified, 2 cement, 3 sand, 7 stone, ¾ inch metal. The quantities we used in making this test were as follows:—A quarter cubic yard of metal, 2·89 cubic feet of sand, and ·48 of a cask of cement. This was deposited in half the space of one of the above boxes, and upon being rammed, as specified, showed an increase in height of half an inch, equal to an increase in bulk of one-eighteenth, showing that in this class of concrete alone did the sand and cement add to the bulk of the metal.

We may add that every 9 inches in the height of the concrete was specified to be washed and grouted with a liquid grout of one of cement to two of sand, and this would absorb a considerable quantity of cement which we have not taken into consideration, nor the ½-inch cement collar-joints, which would also take a fair amount of cement.

We would point out that in the whole of the contracts which we have dealt with there is only 161 cubic yards of special bluestone concrete have been used, and our tests, therefore, would incline us to deduct sixteen casks from our former returns; but, on the other hand, a much larger number would have to be added for the shrinkage in the other concrete.

We are, &c.,

GEORGE MCCREDIE.  
W. THOMPSON.

G. McCredie. 10283. You have also a memorandum showing the advantage gained by the contractors, Messrs. Carter, Gummow, & Co, upon the rearrangement of their schedule prices after their tender had been signed and their Contract 79 had been entered upon—I refer to the rearrangement made at the request of the contractors and with the consent of the departmental officers? Yes; I have made a report in conjunction with Mr. Thompson, which is as follows:—

Varney Parkes, Esq., M.L.A., Public Works Inquiry Commission,—

Dear Sir,

250, Pitt-street, Sydney, 23 July, 1896.

We have carefully gone through the schedule and final voucher in connection with Contract No. 79, and have the honor to report as follows:—

*Item No. 1.*—In this item the schedule quantities give 800 cubic yards of "excavation in tunnel guttering and gadding," and the final voucher has 21·22 cubic yards, showing a deduction of 778·78 cubic yards, which latter quantity was allowed to be carried out as excavation with 4-inch powder, at a merely nominal reduction in cost of 3s. per cubic yard, as per schedule, whereas the proper difference in value would have been 17s. per cubic yard, thus the alteration benefited the contractors by 14s. per cubic yard, amounting to £545 2s. 11d.

Had the above-mentioned 778·78 cubic yards been carried out by guttering and gadding, we would point out that the contractor would have had a loss of 9s. per cubic yard, which would have amounted to £350 9s., based on the Department's estimate of 72s. per cubic yard.

*Item No. 5.*—The schedule quantities give 361 cubic yards of guttering and gadding in shafts, while the final return shows that excavation with 4-inch powder was substituted, which would give the contractor an increased profit of 5s. per cubic yard, amounting to £90 5s.

*Item No. 17.*—In this item there is an increase of 852·17 cubic yards of sandstone concrete in the final return over the quantity shown in the schedule, which would result in the contractor gaining a profit of 7s. 6d. per cubic yard, amounting to £319 11s. 3d., the Government estimate being 30s. per cubic yard.

*Items Nos. 10 to 15 (inclusive).*—For these items the contractor only allows £3 4s. 2d., while a fair cost would amount to £238 15s., and as they were not carried out, the contractor was saved a loss of £235 10s. 10d.

*Item No. 20.*—This item, 180 cubic yards of brickwork, the contract rate for which was 20s. per cubic yard, or £180, was omitted, whereas the Department's estimated value is 60s. per cubic yard, and which, if it had been carried out, would have resulted in a loss to the contractor of £360.

We may point out that in Item No. 4 the schedule quantities give 75 cubic yards excavation in road surfaces, whereas the quantity paid for was 541·77 cubic yards, and as the contractor's price was 78s. per cubic yard, against the Department's estimated value of 6s. per cubic yard, this increase gave the contractor an additional profit of £1,680 7s. 5d.

We are, &c.,

GEORGE M'CREDIE,  
W. THOMPSON.

William Thompson recalled and further examined:—

W. Thompson. 10284. *Mr. Parkes.*] You have heard the reports which Mr. M'Creddie has just read? Yes.  
10285. They are reports which you have made in conjunction with him, and you concur in them in every particular? Yes.

FRIDAY, 31 JULY, 1896.

William Scarlett Delisle Roberts recalled and further examined:—

W. S. D. Roberts. 10286. *Mr. Parkes.*] Will you refer to a test recorded in your cement test-book under date of 24th September, 1895? There are two tests of that date.  
10287. One is a test of cement for Contract No. 118? Yes; for Carter & Co.—500 casks.  
10288. There is also a test under date of 27th September, is there not? Yes; for sewerage Contract No. 118—Carter, Gummow, & Co., 2,000 casks.  
10289. Under date 21st November there is a further test for Contract 118? Yes; for Carter, Gummow, & Co.—1,200 casks.  
10290. The next test you come to is that of John Try's cement, which was in bags, and which was condemned? Yes; it was submitted in connection with Contract 118. The test is dated 5th December. 1,360 bags were tested for Carter, Gummow, & Co.  
10291. It did not pass the test? No.  
10292. And from that time out John Try's cement did not pass? I think that was the last.  
10293. Therefore there is no chance of there having been good cement of John Try's in bags on that contract? There may have been a good deal stored there before that.  
10294. Will you turn up your book and see if you can find any record of passed cement of John Try's in connection with that contract? I see there is a test dated 20th September, 1895; 700 bags were tested for Carter & Co. in connection with Contract 118. That evidently passed the test.  
10295. Will you pass to the next one? The next is a test of the 17th October.  
10296. How many bags would there be in that case? 1,360.  
10297. That was condemned? It was either condemned or tested again.  
10298. How many bags go to the cask? About three.  
10299. Then the 700 bags which were passed would equal 233 casks? Yes.  
10300. There can be no doubt from your book that the cement of John Try's upon Contract 118 from November up to January had not passed? There seems to be not much doubt about it.  
10301. When you were here on the last occasion you gave us particulars of some tests which had taken place in connection with the North Shore sand? Yes.  
10302. I think you said that the sand exceeded the standard adopted by the Department—do not the sheets I hand you represent your tests? They are evidently the tests.  
10303. Will you read the results, beginning with the first test? Yes. The coefficient for tensile strain in test No. 56 was 117·0, the standard being 100; the coefficient for crushing strain was 110·7, the standard again being 100; the loss of weight by washing was 2·8 per cent.; the weight per cubic foot was 106·1; the dosage was 3·2. The residue on a sieve of 400 meshes to the square inch was 11·72; and, on a sieve of 900 meshes per square inch, 16·41. The residue on a sieve of 2,400 meshes was 57·03; and there passed through the 2,400 sieve 14·84.  
10304. Only 14 per cent. passed through the 2,400 sieve? Yes.  
10305. Will you now read the second test? Yes. The test I have just read is that of a sample of sand obtained from crushed sandstone from rock on the property of the North Sydney Gas Company. The test I am now about to read is headed "Sample of sand obtained from quarry near Gas Works, North Sydney." The coefficient for tensile strain was 117·0; the coefficient for crushing strain was 113·0; the loss

loss of weight by washing was 5·3 per cent. There was not sufficient sand to permit of the weight per cubic foot and dosage being given. The residue on a sieve of 400 meshes was 15·22 per cent.; on a sieve of 900 meshes, 13·04; and on the 2,400-sieve, 57·61. There passed through the 2,400-sieve 14·13.

10306. Will you now read Mr. Hickson's minute on the back of the test you first read? Yes; it is as follows:—"On condition that the sand is sifted as done by Mr. Roberts, I recommend that the sand be allowed to be used."

10307. Sifted through what sort of a sieve? There is a note on the test to the effect that the co-efficient for tensile strain, 117·0, was arrived at by sifting the sand through a No. 12 sieve.

10308. That does not show an exceptionally good quality of sand? I do not think you will get a much better quality anywhere as far as these tests are concerned.

10309. What has been the result of your tests so far as the Nepean sand goes? I have not, the tests here, but I do not think they go so high.

10310. Had it not exceeded the standard to a greater extent than has this sand? I do not think the co-efficient for tensile strain has gone so high as 117·0. More cement would be required to fill up the interstitial spaces.

10311. Have you a record of your tests of passed Nepean sand? Yes.

10312. After you have tested cement, beside making a record in your test-book, you also issue a certificate such as that which I now hand you? Yes.

10313. It is first of all submitted to you by the engineer-in-charge, and it records the number of casks on the job? Yes; and gives other particulars.

10314. Every bit of cement which is tested is represented by a certificate such as that which you have in your hand? A certificate is always given.

10315. First of all it is noted by the engineer-in-charge of the work, then by the engineer-in-charge at the office, and then by the Engineer-in-Chief; is not that so? I know nothing, except that I give a copy of the certificate from my book. The matter goes out of my hands then.

10316. Is not what I say recorded upon the face of that document? After I sign these documents they are sent away and signed by the Engineer-in-Chief as passed or rejected.

10317. These documents record all the cement which goes on to a job? Yes.

10318. So that if the documents I hand you are the records in connection with Contracts 79, 79A, and 69, they would record all the cement which has been stored on those jobs? They should be records of all the cement.

10319. If they correspond with your test books they should be correct? They should be correct if they correspond with the books.

10320. *Mr. Davis.*] Referring to the tests you made of John Try's cement on September 24th, 1895, that cement appears to have passed the test? Yes.

10321. But you do not know when that cement was used? I have no knowledge whatever of what was done with the cement.

10322. It may have been used in the year 1896 for all you know? It may have been used anywhere.

10323. You may remember that at the time you made the sand test No. 56, which purports to be a test of crushed sandstone from rock on the property of the North Sydney Gas Company, I took exception to your treating the sand differently from the way in which it would be treated on the works? I recollect some conversation of that kind.

10324. Do you not think that that was probably the reason why I and not Mr. Hickson, as Mr. Parkes said, wrote the minute which you read just now? Yes.

10325. The sand had passed the test in the way you had treated it, and I recommended that if the sand was seived in that way it should be used? Yes.

10326. The same thing arose in connection with sand test No. 54, which purported to be a test of sand from the same position. I asked in my minute whether the sand was tested as it was received and you then wrote this minute: "This test was made in the old way—that is the crushing strength with the sand as received and the tensile strength sifted through the 400-seive. After this test all tensile tests will be with sand sifted through the 144-seive as agreed upon last week"? Yes.

10327. Then I wrote: "This being the case, another sample of sand had better be forwarded for testing";—can you explain why that was written? Yes; in order, I suppose, to conform to the new regulation.

10328. My object was to get the sand tested just as it would be used on the works? Yes.

10329. And not as it would be used by you in the cement-testing room? Quite so.

10330. *Mr. Parkes.*] The minute by Mr. Davis to this effect: "On condition that the sand is sifted, as done by Mr. Roberts, I recommend that the sand be allowed to be used,"—had the approval of Mr. Hickson? Yes.

10331. Therefore there was a departmental approval? Yes.

George M'Credie recalled and further examined:—

10332. *Mr. Parkes.*] Have you anything further you wish to say concerning the report you presented to the Commission on the 24th instant with regard to the cement tests, and also with regard to the advantages given to the contractors by the rearrangement of the schedule of Contract 79? Yes.

10333. In making out the calculation, which showed that an advantage of something like £3,500 had been given to the contractors by the rearrangement of their schedule, you took as your basis the departmental estimate? Yes.

10334. That is, you did not make a calculation from your knowledge of trade prices—you simply took the information which the Government themselves had afforded? Yes; we took the office estimate which appeared upon page 339 of the Parliamentary return. You handed to us Mr. Owen's evidence to guide us as to cost per yard of tunnelling, &c., and we found, on working it out, that it ran out at 39s., but we put it down at 46s. We allowed 46s. per cubic yard for excavation—that is, for tunnelling—guttering and gadding.

10335. You see no reason to alter your figures? No.

10336. You feel convinced that they are right? Yes; they are based upon the estimates of the Department. The report speaks for itself.

10337.

W. S. D.  
Roberts.

31 July, 1896.

G. M'Credie.

31 July, 1896.

G. McCredie. 10337. If you were an engineer drawing an equitable arrangement as between the Government and contractors this is what you would advocate? Yes.

31 July, 1896. 10338. You have prepared a further report concerning the cement which should have been used if the specification had been carried out even approximately in connection with Contracts 79, 79A, and 69? Yes. 10339. When you were here you only took the cement which appeared in the yard bulk, but there were certain other things, such as grouting, and also shrinkage, which you did not allow for? Yes. 10340. Will you tell the Commission what further light your investigations have thrown upon the matter? Yes; I have made a supplementary report, which I will now read:—

Varney Parkes, Esq., M.L.A., Public Works Inquiry Commission, Sydney,—

Dear Sir,

250, Pitt-street, Sydney, 30 July, 1896.

Following on our report of the 23rd instant, we have made further calculations of the quantities of cement required in connection with Contracts Nos. 69, 72, 77, 79, 79A, and 118, in order to allow for grouting and shrinkage in the concrete, and now have the honor to report as follows:—

First—*Grouting*:—Proportions specified, 1 cement to 2 sand. In testing the grout we used one-third of a cubic foot of cement and two-thirds of a cubic foot of sand, which proved to be sufficient for one cubic yard of cement.

This quantity is equal to one-twelfth of a cask of cement, but, even allowing that one-twenty-fourth of a cask, or one-half the quantity we used, would be sufficient, it would require 486 casks for grouting in Contracts Nos. 69, 79, and 79A, and 636 casks for the remaining contracts, in addition to the number of casks given in our returns of the 6th instant.

Second—*Sandstone Concrete*:—Our tests having shown a shrinkage of one-eighteenth, as previously reported in ours of the 23rd instant, it will necessitate our adding 274 casks to the number returned for Contracts Nos. 69, 79, and 79A, and 1,135 casks to the number for the other contracts.

Third—*Bluemetal Concrete*:—The shrinkage in this concrete being one-thirty-sixth, we have to add 367 casks to the number returned for Contracts Nos. 69, 79, and 79A, and 6 casks for the other contracts.

The following are the returns as corrected to allow for the shrinkage of concrete, grouting, &c.

Contracts Nos. 69, 79, and 79A:—

|   |               |
|---|---------------|
| Former return .....                           | 21,612 casks. |
| Add for grouting .....                        | 486 "         |
| Add for shrinkage in sandstone concrete ..... | 274 "         |
| Add for shrinkage in bluemetal concrete ..... | 367 "         |

22,739 "

Deduct for expansion in special bluestone concrete in Contract No. 79.....

17 "

Total number of casks .....

22,722 "

Contracts Nos. 72, 77, and 118:—

|   |          |
|---|----------|
| Former return .....                           | 23,616 " |
| Add for grouting .....                        | 636 "    |
| Add for shrinkage in sandstone concrete ..... | 1,135 "  |
| Add for shrinkage in bluemetal concrete ..... | 6 "      |

Total number of casks required .....

25,393 "

Contracts Nos. 69, 79, and 79A .....

22,722 "

Contracts Nos. 72, 77, and 118 .....

25,393 "

Total.....

48,115 "

Yours, &c.,

GEORGE MCCREDIE.  
W. THOMPSON.

10341. Your conclusions are drawn from practical tests made in a liberal fashion? Yes.

10342. You have not gone to any excessive length to make things eke out as much as you could? No; we have been liberal in every way.

10343. Your report is in accordance with what you consider the nature of the work in hand? It is.

10344. If properly carried out? Yes.

10345. What were the figures you gave as to the cement to be used in Contracts 79, 79A, and 69? The total is 22,722 casks.

10346. And that does not include what are called collar-joints? No; I did not take that into consideration.

10347. That would take a great deal more cement? A good deal.

10348. It did not include the surplus which would have to go in the way of packing owing to the irregularities of the rock? No.

10349. Nor did it include any waste arising from the rendering of the soffit of the arch of the tunnel? No.

10350. You have prepared a second report with regard to your experience as to the quantity of cement which a cask holds in relation to a cube foot? I have no report upon the matter, but I can give you the particulars.

10351. You have made tests? Yes.

10352. With what result? The tests were made with Goodlet and Smith's Rock Brand cement, a cask of which weighs 378 lb. net, and contains exactly 4 cubic feet of cement, as measured in our gauge-box.

10353. What does the imported cement measure? It measures a little more—about 4½ cubic feet.

10354. In the trade a cask of cement is generally taken to be equal to 4 feet? We generally take it at 4 feet. We were in the habit, at one time, of taking six casks of cement to a yard, but the specification of the Department shows 4 cubic feet to a cask.

10355. What has been your own experience? It goes about 4 cubic feet.

10356. That applies to every description of cement, whether of a fine or coarse texture? It is all about the same. There is not a great deal of difference. Sometimes it goes a third of a foot over and sometimes a sixth of a foot over.

10357. Does it ever exceed a third of a foot? I do not know. There is a good deal of difference in the weight and measurement of casks of cement—in the imported ones especially. We have worked entirely upon the specification. In Contracts Nos. 69, 79, and 79A, the weight required by the specification is 387 lb., and this weight must be made up by an increased quantity of the cement. Therefore, it would in the case of these contracts be necessary to add to every cask of Rock Brand cement one forty-second part of a cask to bring it up to the required weight. Presuming that full-weight casks were used, it would require 541 casks less of cement for these contracts, but with regard to the other contracts the cement is specified to weigh not less than 374 lb. per cask net, so that no alteration is necessary in the returns

returns previously sent in. The specification is most distinct as regards the weight of the cement, so that there can be no misunderstanding on the point. G. M'Creddie.

10358. With reference to the question of the shrinkage of cement, I asked you to go out and look at the condition of Contract 101, which is a concrete construction, and I should like to know the result of your investigation? I went out and had a look at the work on two occasions, and as far as I can see the work from the manner in which it is constructed will not stand. The structure from end to end is, I should say, in a state of collapse. There are cracks about every 13 or 14 feet. It is not in use, and as far as I can see is not likely to be used, unless something is done to it, involving the expenditure of a great deal of money. 31 July, 1896.

10359. Do you consider the cracks in the structure are of a serious nature? I do, certainly.

10360. Do you think they are capable of being repaired so that the structure would hold water? I think the best thing to do would be to take off the whole of the top structure down to the table and put in iron pipes. That is my opinion.

10361. By the table you mean the top of the arches? Yes. I do not think that any repairing would make a permanent job of it. Bolted iron plates might be put right along, but that would involve great expense.

10362. Is there any water running through the carrier? Very little water at the present time. Some water appears to have been running through, because the carriers are marked all the way along, showing where the water has been running.

10363. With regard to the porosity of cement—do you think that this structure tends to establish the fact that cement will hold water? My opinion is that it will not hold water. What I saw the other day confirms me in my belief that concrete and cement are not fit substances to carry sewerage matter.

10364. Is there any leakage from the carriers in Contracts 64 and 101? Yes. Nearly every pier is cracked in the middle. The water is running through from the springing of the arches right down the face of the piers. Upon the haunches all the way along there are signs of leakage.

10365. Is the leakage of an uniform nature over the soffit of the arch? Yes; it is pretty well over the soffit of the arch, coming down through the joint of the brickwork. The face of the brickwork is in fair order. The only places where the water is coming down is in the joints of the stone course on the top, where it comes against the brickwork. Down the haunches of the arches, below the brickwork, it seems to have been leaking pretty badly. Almost every pier along the centre shows either a crack or a sign of leakage such as you would see before a crack takes place.

10366. What would be the result of sewage matter running through the carriers—do you think it would saturate the work? Yes, I should think so.

10367. Would not that be a menace to health? I should say it certainly would.

10368. What is the length of the aqueduct in Contract No. 101? It is about 25 chains in length.

10369. What do you think would be the cost of repairing that length of aqueduct? It depends entirely upon how it is repaired. The best way to make a permanent job of it would be to take the whole of the top structure off and to run iron pipes along. You could not tell what it would cost unless you went into it very carefully. I should think it would take from £20,000 to £30,000 to make a good job of it.

10370. In the face of experience like this, do you not think it is a very grave thing for the Department to still proceed with these cement structures? Yes. I do not think it is a wise thing to have cement structures at all for sewerage works.

10371. Do you think the cement structure in Contract 77 will hold water? As I said when I gave my evidence before, I have not had any experience of Monier structures, but I do not think it will hold water. I think the Department will have trouble with that work similar to that which they have had in connection with Contract 101. I do not think it will serve the purpose.

10372. Do you think the iron in No. 77 will prevent the structure from cracking? My own opinion is that the thinness on the side of the carrier in Contract 77 is a source of very great weakness. I do not think the iron will prevent the structure from cracking.

10373. Would not the iron, being in 4-inch mesh-work, be likely to make the cracks more numerous? Experience only can show us that. My own opinion is that it would be a source of weakness to the structure. I think, considering the thinness of the side of the carrier, that, so far as the iron grid is concerned, it is more likely to crack with it than without it. Once the work begins to crack and open up, as cement generally does, the iron would receive the effect of the weather, and the damage would be very extensive then. What I have seen in connection with Contract 101 only bears out what men who have to do with the practical carrying out of this class of work have always said—that is, that concrete and cement always show cracks at distances of from 12 to 14 feet apart.

10374. Once cement or concrete cracks, is it, judging from your experience, possible to repair it? If you go out to Contract 101 you will see the results of repairing the cracks. In some cases there the cracks have been cut out to a width of about 3 inches, and have been filled in with pretty good cement—probably neat cement—but they are already opening again. It is almost impossible to get the old and new joints to come together and make a compact job.

10375. Running all along the aqueduct from end to end, about halfway down the work, there are cracks? Yes. The cracks run right along. When I first saw it I thought it was due to the water line—that it was probably the water level inside the carrier, and that the water had run out through the concrete. I was under the impression that the water had come out at the junction of the sandstone with the bluestone concrete, but after looking at the plan I find that the bluestone concrete is carried right up to the top. The sandstone concrete is merely over the crown.

10376. It is practically the springing of the arch? Yes. And you must remember that, according to the plan, there are at the side of the carriers 16 inches of solid material.

10377. Would you, as an engineer, venture upon a cement structure of this nature? Not above ground.

10378. Do you know of any other engineer in the city who would do so? I do not know whether the others are of the same opinion as myself? I am speaking now from my own experience.

10379. Have you noticed that other engineers and architects avoid cement structures? They do not generally go in for concrete and cement structures above ground.

10380. When using concrete even underground you always put T rails through it? Yes; when I have used concrete underground for foundations I have put old railway irons in and bolted them together at every junction.

10381.

- G. M'Credie. 10381. Is not that done because the concrete cracks even there? Yes; it is done to keep it from parting at certain points.
- 31 July, 1896. 10382-3. Speaking as an engineer of some experience, what is your opinion of the work you saw upon Contract No. 101? My opinion is that if the job is to be made a serviceable one the top would have to be cleared away. If you were to start repairing it you would have to be continually repairing it from end to end. I am quite satisfied that any practical man of experience would endorse that opinion.
10384. *Mr. Davis.*] I want you first of all to look at the report which you made to the Commission on the 24th July, with respect to the schedule and final vouchers in connection with Contract 79. Look at paragraph 1, item 1. You assume, I suppose, that the specification provides for 800 yards of excavation to be done by means of guttering and gadding? Yes. That is the quantity mentioned.
10385. Will you turn up the specification and show his Honor where 800 cubic yards are specified to be carried out by guttering and gadding? You will see from our report that we have gone carefully through the schedules and final vouchers.
10386. Then you do not say that this quantity is specified to be carried out? What I say is this—"We have taken the final voucher for Contract 79, and we were asked to compare the schedule quantities with it."
10387. Am I to assume that your report is based not upon the specification but on the final statement of the quantities compared with the schedule? Yes; that is distinctly stated in the report.
10388. Without reference to the specification at all? Without reference to the specification.
10389. You notice the printed words at the head of the quantities? Yes, "probable quantities."
10390. Will you also read the note at the head of the schedule? Yes; it says, "The quantities in this schedule are not guaranteed as correct, but are merely given for the guidance of intending contractors, this being a schedule of prices current."
10391. Would you understand, taking that note in conjunction with the heading "probable quantity," that the quantities were variable or not? I understand that these quantities are variable.
10392. You have assumed in your report that they are not variable? I have not assumed anything. I have simply carried out the instructions of Mr. Parkes to compare the schedule quantities and prices with the final voucher.
10393. You say in your report, "In this item the schedule quantities give 800 cubic yards of excavation in tunnel-guttering and gadding," and the final voucher has 21.22 cubic yards, showing a deduction of 778.78 cubic yards, which latter quantity was allowed to be carried out as excavation with 4-inch powder at a merely nominal reduction in cost of 3s. per cubic yard as per schedule? Yes, that is the schedule price.
10394. You say that the proper difference in value would have been 17s. per cubic yard—how do you arrive at that? In two ways. In your estimate you make the difference 17s.;—there is 55s. against the 4-in. powder, and 72s. against the first item.
10395. Does that refer to Contract 79? Yes; I take it from the papers that that is so.
10396. *His Honor.*] Having looked at the papers, you think you must have made a mistake in assuming that the prices appearing upon page 339 of the Parliamentary papers were the office estimates for Contract 79? I was under the impression that they were.
10397. But, having looked at the papers, you conclude that there is possibly a mistake? Yes, possibly.
10398. *Mr. Parkes.*] You would like to look further into the papers to make sure of the point? Yes.
10399. *His Honor.*] After looking at the portion of Contract 64 which you saw the other day, I suppose you did come to the conclusion that the dark stains along the face of the work upon Contract 101 were really due to the percolation, not of sewage from the carriers, but of water that had passed over the asphalt and through the joint between the asphalt and the line of cemented concrete on the top? My opinion is that if the asphalt coloured the leakage it would have coloured it from the top, but it is in a straight line right along some distance below.
10400. But, as far as the staining is concerned, comparing the two contracts, do you not think that the peculiar colour might be due to the percolation of water between the asphalt and the concrete? It may be so. The water would have to go down through the concrete to get out. What I wanted to say just now was this,—that if the water had gone over the edge you would have seen it from the edge downwards, but the discolouration appears about a couple of feet below the surface of the asphalt. This discolouration could not have been caused by sewage matter, because the carriers have not been in use. It is quite possible that the asphalt might have discoloured the water, but it would have to go down through the concrete in order to get out where the stains appear.
10401. *Mr. Davis.*] As to Contract 101—from what cause would you say the structure had been cracked? I could not see any settlement in the piers, and I take it that it would be from the expansion and contraction of the material. I believe good blue-metal concrete may have been used. The work appears on the surface to have been well carried out as regards the material, but it is certainly cracked along the arches right through. There was only one arch in which I noticed a settlement, and that was towards the end near the junction with 112.
10402. You think there has been a settlement there? Yes.
10403. Do you think the cracks are due not to inferior workmanship but simply to changes of temperature setting up expansion and contraction? I am not in a position to say whether the material in the job is good or not, but it appears on the surface to be good. I think the cracks are due to the expansion and contraction in the material itself.
10404. From your experience you must know how difficult it is to control that? I know how difficult it is to control any work like it.
10405. You question whether it was wise policy to put up a structure of that description at all? Yes; my own opinion is that it is not wise to build these structures of concrete.
10405. Have you examined the plans of No. 101? Yes.
10407. Did you notice that provision was made for covering up the sewer? Yes. I noticed that there is an embankment for covering up the sewer.
10408. Supposing the embankment were put along the sewer, what effect would it have upon the expansion and contraction of the concrete in the aqueduct—would it stop it or otherwise? It would have this effect, that you would not see the cracks.
10409. Did you not say that concrete below ground would not contract and expand? No; what I said was that we often put iron in it on account of its contracting and expanding.
10410. Below ground? Yes.
- 10411.

10411. Will you explain what causes concrete to expand and contract? As far as the material itself is concerned, heat and cold will generally cause expansion and contraction. The material always seems to contract and expand so as to cause cracks at distances of 10, 12, and 14, feet apart. Even in the best of concrete embankments you will see it. That is my experience. G. M'Creddie.  
31 July, 1896.

10412. Do you think that a concrete structure, covered up with a reasonable quantity of earth, would be likely to be affected by the changes of temperature that we get here in Sydney? You are assuming that the work would be covered up when it was built; but you must take this into consideration, that you may cover defective work up, and you will not be able to tell how it will act when it has been covered up once it has started to open out.

10413. I will put it in this way: would concrete expand and contract under earth? I could not tell you.

10414. Would it expand and contract to the same extent as if it were exposed? Not to the same extent, I should think.

10415. Would it expand or contract appreciably under earth? I do not think so, if it were covered up when the work was new, because we use concrete in the foundations of buildings, and have very little trouble with them. In very treacherous ground we put iron in it.

10416. You say that the only way to make Contract 101 a good job would be to take off the top portion of the aqueduct down to the level of the invert or table, and to put in pipes? Yes.

10417. What sort of pipes? Similar to those which have been used in a neighbouring contract.

10418. Did you see those pipes? Yes.

10419. What sort of pipes are they? I did not have a good look at them, but I should think that, if  $\frac{3}{4}$ -inch pipes, covered inside with a coating of cement, were used, they would last for many years.

10420. You think, I suppose, that the question of cost is an important element in deciding upon the kind of structure you are going to build? No doubt it is.

10421. Do you not think that in a structure of this description, even where the Government are concerned, the question of cost should be considered? Yes; but at the same time you have to consider durability.

10422. Supposing you get a structure which would give you the same results for 5s. that you could obtain in another structure costing 7s. 6d., which would you adopt? If they were equally substantial, I should adopt the cheaper one.

10423. With reference to the contents of a cask of cement, you said in giving evidence on 12th June before this Commission that you regarded six casks of cement to be equal to 1 cubic yard? Yes, we used always to calculate it in that way.

10424. How much would that be per cask—what would be the contents?  $4\frac{1}{2}$  feet.

10425. Making 27 cubic feet? Yes.

10426. It is not  $4\frac{1}{2}$ ? No. After giving that evidence, I drew attention to the fact that I had noticed in the specification that the contents of a cask were given at 4 feet.

10427. Were they specified to be 4 feet? They were said to be equal to 4 cubic feet.

10428. Let me refer you to page 344 of the Parliamentary Return:—"To facilitate the gauging of cement throughout the contract, cement casks will be taken as equal to holding 4 cubic feet; otherwise, the contractor to provide and make approved gauge-boxes, holding exactly 4 cubic feet, for measuring cement. Cement of a lighter weight than herein stipulated, but otherwise equal to the specified test, may be permitted to be used in the works, subject to the decision of the Engineer-in-Chief, and provided that the deficiency in weight is made up in quantity";—would you think that the portion relating to 4 cubic feet gives a specification to the effect that a cask of cement is to hold 4 cubic feet? Provided the weight is up to the standard.

10429. Is it not this—that if the contractor says, "I do not want to gauge the cements," the Department says, "If you do not, we will accept one cask of cement as 4 cubic feet"? Precisely.

10430. You based your report upon the assumption that the contractors would give a cask of cement equal to 4 cubic feet? No.

10431. Do we specify a cask of cement to be 4 cubic feet—is that so or not? You specify that a cask of cement will be taken as 4 cubic feet.

10432. Suppose a cask of cement contains  $4\frac{1}{2}$  cubic feet, more or less, and the contractor elects to gauge the cement instead of giving a cask of cement as being equal to 4 cubic feet, the contractor will make more than 4 cubic feet out of it? I have allowed for that. I have taken 500 odd casks. Besides, you have safeguarded yourselves by the provision in your specification as to weight.

10433. As to grouting, you gave in evidence that you had made an experiment as to the quantity of grouting required for a cubic yard of concrete; you say that you require a cubic foot of compo. made into grouting for that quantity of concrete; will you explain how you made the experiment? We used a third of a cubic foot of cement and two-thirds of a cubic foot of sand. We mixed it up and put it in a bucket and made it into a liquid, and we then poured it over 4 superficial yards of concrete. It turned out that that was just sufficient to do the work. It was equal to one-twelfth of a cask of cement. We allowed for this—that perhaps the contractor might not put in quite as much grouting, although we considered it a fair and reasonable quantity to put in. We cut it in halves and allowed one-twenty-fourth. We thought that would be a good safe margin.

10433 $\frac{1}{2}$ . First you put a layer of concrete, then you mixed up the grouting and poured it on the concrete? No; we had 9 inches of concrete, and we washed the surface of it, and we then grouted it as if we were going to put another layer on the top. We then measured it and gave one half of the quantity we used.

10434. Leaving out of question your opinion as to the meaning of the specification, and supposing that grouting were not to be done, would it be fair to compute the quantity of cement which would have to be used in the grouting, and to charge it against the contractors? I can only say this: if the grouting is not done the job is not a job.

10435. You say in effect that the grouting should have been done? Certainly. In all concrete work it should be done. We never put a layer on a dry joint under any circumstances. I would always grout it even in foundations.

10436. Suppose the concrete is not allowed to get hard—supposing it is quite green and sloppy—that it is as moist as compo.? Then you do not use your specifications. We must work upon something.

10437. Suppose the grouting were not used, would it be fair to charge it against the quantity of cement which should be used in the contract? Then, what you mean is, that the concrete is put in more than 9 inches deep at a time and is not rammed.

10438.

- G. M'Credie. 10438. *His Honor.*] Suppose the work follows on so quickly that, after the ramming of one layer of concrete, another layer is put on when the first layer is quite wet, when it is not set, or beginning to set, is there any necessity in common sense for the grouting—is there any use in or benefit from it? No; the concrete will be one body then.
10439. Even though the work may be done in layers? Yes; but it would be a most unusual way of doing it.
10440. *Mr. Davis.*] But there would be no necessity for grouting under those circumstances? No.
10441. And it would not be right to charge the cement for the grouting against the contract? No.
10442. You said you had had considerable experience in concrete work of this description where cement is used—would it be practicable to put in concrete in 9-inch layers in a tunnel, where most of this work has been carried out, and where the concrete is 5 inches thick? It depends entirely upon the position of the tunnel. It depends upon how you carry out the work. It may not be practicable to put the concrete 4 inches wide round the sides of a tunnel.
10443. What length of tunnel would you require to keep a moderate gang of men going, allowing every 9 inches to set before you put the next 9 inches in? If I were the contractor I would put it all in if I could manage it.
10444. Would it make the best job? It would make a solid job. But why is it supposed to be put in the way specified for that size of a tunnel?
10445. So that, if the Department, in its wisdom, thought that the best way to carry out the work, you would not take serious objections to it? I believe in this class of material being put in as quickly as possible.
10446. Let me come now to the collar-joints? I have not allowed anything for collar-joints, so that it is of no use to deal with them.
10447. You said on giving your evidence on a former occasion that you had made some experiments with brick-work, what was the thickness of the work? Nine inches, in an arch.
10448. Were the bricks laid in two rings? Yes.
10449. Was there any collar-joint between? Yes.
10450. So that in the experiment you made you included collar-joints? I do not call that a collar-joint; I call it a grouting. What I should call a collar-joint would be the joint above that before the concrete comes in.
10451. What does the specification say? It says:—"The brickwork required in lining tunnels, branch sewers, sewers in open trenches, and shafts, to consist of the materials and mortar described under clauses 13, 19, 20, and 21. All circular work and arches of shafts, or elsewhere, to be built of radiating bricks, unless otherwise directed. All bricks to be thoroughly soaked in clean fresh water for not less than five minutes immediately before being used. All work to be built with whole bricks, and all walls in English bond, with  $\frac{1}{4}$ -inch joints, in alternate courses of headers and stretchers, each brick to break joint with the one above and underneath, and to be set full and rubbed in cement mortar. Every course to be carefully and thoroughly grouted, and well wetted before the succeeding course is put on."
10452. What do you understand from that? That you call collar-joints the grouting between two rings of brick.
10453. Did you do that work? We did not put in so thick a joint as that.
10454. The thickness of your brickwork was 9 inches? Yes.
10455. What is the width of an ordinary brick? The size is 9 in. x 4 in. x 3 in.
10456. You say that your brickwork was 9 inches, add two bricks together—two 4 inches—and what would be the collar-joint? I do not see that that has anything at all to do with the matter. I have told you distinctly that I did not allow for any collar-joints in taking out the quantity of cement.
10457. But I want to show that according to your former evidence you did, and what is more, according to your evidence now, that you have allowed an inch? I have not said anything of the sort. I defy anyone to upset my test for brickwork. 5.5 of a cask of cement will do a yard of brickwork. I had a hard job to do the second yard with the quantity.
10458. But you say you have not allowed any cement for collar-joints? Not for what I call collar-joints. You will see another clause in the specification referring to the collar-joint between the concrete and the brickwork—where the concrete and the brickwork come together. That is what I call a collar-joint.
10459. The width of a brick you say is 4 inches, and the thickness of your brickwork was 9 inches, and you used two bricks? Yes.
10460. Then the remaining inch would be of compo? Yes. The second trial I made took nearly two of cement as against one and a half, so that I gave you a fair deal so far as that matter is concerned.
10461. Is the specification for Contract 79 the specification from which you have read as to the collar-joints? I do not see what collar-joints have to do with the matter, seeing that I have not included them.
10462. Will you look at page 282 of the Parliamentary return and tell me what the specification there refers to? To the southern outfall sewer at North Sydney.
10463. Will you read the part of the specification dealing with collar-joints? Yes; it is clause 110, page 287. I may mention that this is not the clause which I have had in view as referring to collar-joints, but it says:—"Where the brickwork consists of two or more rings, said rings to be built simultaneously, the lower ring to be always completed throughout  $4\frac{3}{4}$  inches in advance of the upper succeeding layer of each ring of brickwork, to be carefully and thoroughly wetted and grouted, and then covered with a coat of cement mortar, collar-joint,  $\frac{1}{2}$  inch thick, to ensure the thorough bonding of the joints and the different rings of brickwork."
10464. Would that collar-joint apply where there was single-ring work in the tunnel? No, there would not be a collar-joint there, only where it joins the rock-face or concrete.
10465. Suppose the brickwork in No. 79 were all single-ring work, would there be any collar-joint? There would be no collar-joint in the brickwork itself, but there is a part of the specification which says that where the brickwork goes against the concrete there is to be a collar-joint. If the collar-joint were not put in as against another ring of brickwork it would be put in between the brickwork and the concrete.
10466. But supposing no brickwork were built against the concrete there would be no collar-joint? No. The clause to which I have been referring is 112, and it says:—"Wherever concrete is to be built on to and against brickwork, or brickwork on to and against concrete, the latter in each case to be well wetted and grouted, and then to be covered with a coat of cement mortar, collar-joint,  $\frac{1}{2}$  inch thick, before
- the

the concrete or brickwork is built against it." I take that to mean that if there is only a single ring of brickwork the collar-joint would be between the concrete and the brickwork. G. M'Credie.

10467. Suppose the drawings show that there is no collar-joint whatever in the arch of the sewer? 31 July, 1896.

Then you would have to take the specification as against the drawing.

10468. Supposing no collar-joint were put in, would it be fair to include it in estimating the quantity of cement which would be used? I take it that the specification would be always taken as against the plan.

10469. But suppose the brickwork were all single ring and no brickwork were put against concrete, and that therefore no collar-joint would be used on the whole of the contract, would it be fair to compute the quantity of cement which would be used in a collar-joint and charge it against the contract? It would not be fair to charge it against a contract if it were not put in; but I suppose you understand how I worked out these quantities. I took the final voucher paid by the Treasury and made a comparison with the yards of stuff. I also made practical tests of the quantity of cement which would be used to carry out the specification, and made up my return accordingly. It is not for me to say whether the work was carried out by the contractors or not. It was my business to make up the return upon the basis I have named.

10470. You say you made experiments with brickwork? Yes.

10471. And you applied that experiment to what was done in these sewerage contracts? Yes.

10472. Now you tell us that your brickwork was 9 inches thick, and that in that brickwork you allowed an inch collar-joint? We used ordinary grouting; it would be about one-fourth inch thick. I could not say from memory what the exact thickness was in this case. I know that the most we could do was to make half a cask do a yard of brickwork.

10473. I wish now to take you to the second report you made to the Commission on the 23rd July. As to the gauging of concrete I suppose you used an ordinary fork? I used a 12-inch 10 pronged fork, the sort of fork you use upon Government work.

10474. There would be about an inch between the prongs? Yes.

10475. *His Honor.*] At the points? Yes; they run pretty well parallel.

10476. *Mr. Davis.*] You say you made an experiment in every respect in accordance with the Departmental specification? Yes.

10477. You were most particular as to that so that you might get a result upon which you could rely? Yes.

10478. Did you make any experiments with concrete before those referred to in your report of 23rd July? I have often made experiments with concrete. I may say that I consider the whole life of a professional man is an experiment as regards concrete.

10479. But did you make any experiments for the purposes of this inquiry? Only those referred to in my previous report, and I think those had reference to brickwork and rendering.

10480. You did not make any experiment as to concrete? Not specially. I think I said that the particulars I gave regarding concrete were taken from my general experience.

10481. Will you turn to your evidence of 8th July. You then gave the following evidence:—

7756. You used the same proportions as are contained in the Government specification—that is, you took a yard of brickwork at so much, the piping at so much, and the concrete at so much, making tests in each case? Yes.

7784. Now with regard to the bluestone concrete, how did you arrive at the quantity of cement in a cubic yard of bluestone concrete; what proportions are specified in the case of Contract 69? 4, 2, and 1. The cement and sand disappear in the metal. I found that there was 1'6875 casks of cement in a yard of concrete.

7788. Are you speaking now from the experiments you have made? From experiments I have made from time to time in connection with that class of work.

7790. Do you not think that the gauge of the stone has a great deal to do with it? I am speaking now of my experiments on different jobs. If you are referring to the experiment as regards this particular class of stuff, I think the gauge of the metal was  $1\frac{1}{2}$  inch.

How do you reconcile what you have just told us with your answers to these questions? I thought I made it perfectly clear, on 8th July, that I had not made any experiments with concrete—that is, any special experiments.

10482. I suppose the size of the stone would have something to do with the quantity of mortar absorbed, and which it would take to fill the voids? Yes.

10483. In other words, if the stone were of uniform size, say 2 inches cube, it would have more voids than stone which would run down from 2 inches to the size of a pea? Certainly; the tests show that.

10484. I do not know whether you noticed the evidence given by one of Mr. Parkes' witnesses in answer to question 2451. The witness said, "The metal was not the right sort of metal; it was too fine; it was more like sand; I think I can safely say that sometimes the bankers would measure over 20 feet, and a cask of cement is supposed to go to every banker." That might be a little exaggeration, but I suppose you would agree that the bulk made would depend upon the fineness or otherwise of the metal? Yes.

10485. Have you worked out the percentage of shrinkage, taking the dry material for your experiments? As against wet, do you mean?

10486. I mean as against concrete in position? No.

10487. Would you be surprised to find that it is 43 per cent.? I should not be surprised to find anything myself. I have not worked it out.

10488. Supposing authorities of standing give as their experience 25 per cent. in work under more favourable circumstances than that in sewerage works, what would you say? That has nothing to do with my tests. I have nothing to do with that.

10489. Would you say that your tests were reliable in the face of that? My tests are certainly reliable. I will stake my reputation on those tests. Disinterested persons besides myself witnessed them.

10490. What I mean is as to the application of your tests—your tests giving a shrinkage of 43 per cent., whereas undoubted authorities give as the shrinkage under more favourable circumstances than in sewerage works only 25 per cent.;—would you say in the face of that that your tests might be fairly applied to work in position? I certainly would. You will find that almost every authority differs, and I would take my own tests as against any authority. You must remember that putting the concrete into the box is a more severe test in this way—that in the box you make more bulk on account of the level filling

- G. M'Credie. filling and the level surface as against putting the concrete into an excavation where it would not be possible to make the surface as level as in a box.
- 31 July, 1896. 10491. Would you say that you could ram concrete horizontally to the same extent as you can ram it vertically. Let me put the case of a good, substantial pier, where the concrete is confined within a fairly smooth box, and another case where you have to pack the tunnel over brickwork, and where there are all kinds of little holes and curves cut out in the surface of the rock;—would you be able to pack over the arch of the tunnel as tightly as in the case of the pier? Of course not.
10492. Suppose you took 27 cubic feet of concrete on a mixing board, and first of all put it into the pier, you would expect to get 27 cubic feet of concrete? Yes; less the shrinkage.
10493. Putting the same quantity over the arch of the sewer, would you get more or less in measurement? It is a question as to how the excavation is taken out. I should take it that in a work such as that with which we are dealing in these contracts, where the Department pay for only the exact measurement, and where the tunnel was blasted from time to time, that it would take more than 27 feet of concrete to fill up a yard.
10494. Suppose the tunnel were measured accurately, would you make 27 cubic feet of measurement out of 27 feet of concrete as it lay on the board? Assuming that you do not ram every 9 inches on the side of the sewer, what you want me to say is that it is more difficult to get 27 feet in round the sewer. I should say that it would be, but I will not say that it would take more stuff.
10495. Did you use Molesworth and Hurst? No, I used no formulas; I relied upon my particular tests.
10496. Then what did you mean in reply to Question 7851-2-3? I had the references, but I never used them. I have "Molesworth" in my bag now as far as that is concerned.
10497. Will you show me the page of Molesworth to which you referred? At page 309 of Hurst you will find the following: "As a rule, 1 cubic yard of broken stone or clean shingle is required to make 1 cubic yard of concrete, but if the sand be increased beyond the above proportion the quantity of shingle required is diminished, although in a somewhat less ratio than the sand." I may mention that Mr. Parkes had been asking me questions about the disappearance of sand and cement in the interstices of metal.
10498. How many parts of stone or shingle have you in the case to which you have just referred? Six parts of clean shingle, 2 of sand, and 1 of cement.
10499. Would you suppose that 4 parts of stone would have as many voids as would 6? It depends upon the gauge.
10500. But taking the same gauge? You want to compare Hurst with the tests. I must object to comparing Hurst with our tests at all. It is outside of the question altogether, because ours were practical tests, fairly and legitimately made upon your specification.
- 10501-2. Sutcliffe, upon page 136 of his work "Concrete, its Nature and Uses," says, "The test No. 8 is one of a series given by Lieut.-Colonel Gillmore in his book on 'Limes, Hydraulic Cements, and Mortars.'" He succeeded in obtaining aggregates with a minimum percentage of voids; ordinary limestone was crushed by a Blake's stone-breaker into pieces of all sizes below 2 in. cubes, and into various shapes; and gravel was obtained from the seashore, consisting, after the sand had been screened out, of pieces varying "from the size of a pea to that of a hen's egg." He found that the least amount of voids occurred in those mixtures which contained 15 measures of gravel and from 11 to 15 measures of broken stone. The worst mixture (15 to 27) contained only 30 per cent. of voids. The best (15 to 13) contained 23 per cent. This is a vast improvement on the voids mentioned above for broken stone of nearly uniform size. Solid concrete made from the latter would be 20 to 30 per cent. weaker than that made from the former, while the cost of the two would be practically the same. Roughly speaking the bulk of Portland cement is, according to Mr. Sandeman, reduced 10 per cent., and of sand 20 per cent., by mixing with water, and the contraction in volume caused by mixing sand and cement together is about 5 per cent. According to Mr. Sandeman, a further contraction of 4 per cent. takes place during the setting of the mortar. From these data we may calculate that cement and sand, 1 to 1, will produce mortar about 76 per cent. of their volume; 1 to 2 about 74 per cent.; and 1 to 3 about 73 per cent. I want to ask you in the face of that whether you still say that 43 per cent. of void is applicable to the case in point? I will not say anything of the sort. I say that these tests are made entirely on the specification. I am not going to compare them with any authority.
10503. As to whether they apply or not you are not concerned? They do apply, because the specification states that the materials are to be used. As a practical man, I would insist upon the application of the conditions. What is the good of a specification if it is not carried out?
10504. Do you always work up to specification precisely? I endeavour to do it as far as I can, but I am not infallible.
10505. Here is another extract from a treatise on masonry construction, by Ira O. Baker, Professor of Civil Engineering in the University of Illinois. He gives the results of 10,000 yards of concrete used in New York; the shrinkage was 25 per cent. At page 111 he gives the analysis of the composition and cost of the concrete employed for laying the foundations of a sea-wall at Lovell's Island, Boston Harbour; in that case, also, the shrinkage is 25 per cent. The total materials are given as 1.27 cube yards, at a cost of 1 dollar 67 cents, and he gives the total cost of 1 cube yard of concrete in place as 2 dollars 11 cents; the proportions for the concrete were 1 of cement, 2 of sand, and 7 of gravel;—would you still say that your 23 per cent. shrinkage would have any application? What I say is that my tests are correct, and are made in accordance with the materials specified.
10506. Do you say that you mixed the concrete, in the experiments you made, in conformity with the specification? Yes.
10507. Will you turn up the specification and show me where it is specified that the metal shall be forked? It is not specified to be forked, but how would you specify it—would you say that it should be sieved?
10508. Did you sieve it? No; I forked it.
10509. What was the measurement of your fork? About an inch between the prongs.
10510. Will you take the specification and tell me what the mesh of the screen is? It is a small mesh screen. Perhaps I had better tell you what we did. The metal was broken to the gauge specified. It was then put into a barrow, washed, and turned out on to the board, and mixed first with the sand on top and then with the cement on the top of that.

10511. Will you tell His Honor what the mesh of the screen is according to the specification? Clause 26 says:—"Sandstone concrete, where ordered to be used in these works, to be composed of one part of Portland cement, two parts of sand, and five parts of sandstone (as specified under clause 16) metal, free from dirt, quarry refuse, sieved (as specified in clause 18), washed, and of a size to pass with its largest dimensions through a ring of 2 inches in diameter. All materials to be mixed in the same manner as hereinafter specified for concrete." If you turn to clause 18 you will find the following:—"Broken stone for bluestone concrete to be of basalt or other similar hard stone of approved quality; to be broken by hand or crushing machine, of a size to pass freely with its largest dimensions through a ring of 1½ inch in diameter; the whole of the metal to be free from dirt, quarry refuse, &c.; to be screened through a sieve of meshes ½ inch apart, and then to be washed with fresh water until approved, before it shall be deemed fit and suitable for these works."
10512. You did not screen the metal? No; as I have said, we forked it, and then washed it in a barrow to see that there was no dirt or anything of that kind in it.
10513. *His Honor.*] When you say you forked it do you mean that you took it on a fork from one position to another? Yes.
10514. So that a great deal of the small stuff less than 1 inch in diameter would drop through? Some of it would drop through. Some of the stone used was less than the full dimensions.
10515. But your forking would reject a great deal of the very small stuff? Yes. Of course when dross and rubbish are put in they take the place of cement and sand, and the concrete is not so good.
10516. *Mr. Davis.*] If the metal were put over a screen with ¼th mesh what would pass through the screen? There should not be any small stuff, any dust, or dirt left in the stone.
10517. Would anything more than dust go through? Very little more than dust.
10518. So that the specification provides that anything between 2 inches in the case of sandstone and 1½ inch in the case of bluestone down to a pea may be used in the concrete? No; I would not say that. It is specified to be broken to 1½-inch gauge.
10519. *His Honor.*] You mean that that is to be the maximum? Yes. Some of the stone is to be broken to 2 inches, some to 1½ inch, and then there is the ¾-inch screenings. If you are going to mix the lot together what is the use of having them specified in this way. If a man gets a job to break metal to 1½-inch gauge, he is supposed to break it to that gauge and not to fill it up with a lot of small stuff.
10520. *Mr. Davis.*] You admit that the specification reads rather differently from that? That is the way I should read it.
10521. But the specification under review is a different thing? I do not admit that at all. You specified for the stone to be broken to a certain gauge.
10522. The specification speaks for itself? Yes.
10523. What was the size of the box you used for gauging the mixture? 4 feet by 12 inches by 12 inches.
10524. How did you gauge the ½ cubic yard of sandstone? I mixed 13½ cubic feet of 2-inch stuff.
10525. How did you gauge it? I put it into the barrow, washed it, and forked it into the box.
10526. How did you measure the balance? It was measured exactly in the 4-foot box.
10527. Is that the way stone is usually measured for large contract works? The proportions would be just the same as though you were using double the size of box.
10528. But is it usual upon large contract works for a man to stand by with a rule and measure to an eighth of an inch the height of the stone? I do not think it is usual, but we had to make a test, and I am here prepared to swear that we made it, and that it was not scamped in any way whatever.
10529. And you wish us to take that test by itself without reference to the way in which sewerage works are carried out? I take the test simply as it was carried out.
10530. Without reference to the sewerage works? It had reference to the sewerage works, because it was based on the specification.
10531. I suppose you measured the sand in the same way? Yes.
10532. How did you measure the cement? We took a cask of cement to be 4 feet; we measured and weighed the cask so that there might be no mistake about it.
10533. You used a fork for the bluestone? Yes; we forked it out of the barrow on to the board.
10534. What size of stone did you use for the special concrete? ¾-in. screenings.
10535. Is that what is specified? It does not appear to be named in the specification.
10536. Did you, in making your experiment for special bluestone concrete, use the size of stone specified? We took it at ¾-in. instead of 1½-in., as specified in Contract No. 77.
10537. You did not comply with the specification in that respect? No; we took ¾-in. in the case of the 7, 3, and 2; but there is not very much of that work.

James Symonds recalled and further examined:—

10538. *Mr. Parkes.*] Since you gave evidence here before, Mr. W. A. Smith has stated that the vouchers to which you referred as showing the cost of the Monier culvert at Strathfield are incorrectly given;—you have made investigations which satisfy you as to the correctness of the figures you formerly gave? Yes; not so much to show the correctness of my figures as the incorrectness of Mr. Smith's figures.
10539. *His Honor.*] What course have you taken in making the investigations? I have dealt with Mr. Smith's objections *seriatim*.
10540. *Mr. Parkes.*] The vouchers you used on the last occasion were signed by yourself and countersigned by Mr. Smith? They were signed by myself, and initialled by Mr. Smith to certify that they are correct. As regards voucher 389, Mr. Smith is quite in error in stating that fourteen casks of cement charged were not used, the fact being that none or but very little was left over, as can be shown by the fact that a fresh supply was needed and obtained for the next work. The men when they left this work went to put in another small culvert, and in order to do the work necessary—that is, in making an inlet which required only two casks of cement—we had to get a fresh supply. As to voucher 275, Mr. Smith objects to the payment of the amount of £25 16s. to Mr. Bramston on the ground that he was not actually engaged upon the work. I say that he had very little else to attend to while this work was in progress, and that the whole of his two months' pay was rightly charged to this work. I defy Mr. Smith to

James  
Symonds.  
31 July, 1896.

J. Symonds. to point out any definite work of any consequence which he had to do at that particular time in addition to this work. The deduction wrongly claimed by Mr. Smith amounts to £25 16s. As to voucher 414, 31 July, 1896. Mr. Smith in his evidence says that the culvert was completed and open for traffic subsequent to 2nd August, but there are five days or four working days for which he does not account, and the wages of the five men for that time would amount to £7 4s.

10541. *His Honor.*] That would leave a deduction of only £2 16s. 11d. instead of £10 0s. 11d.? Yes.

10542. *Mr. Parkes.*] What is the next item? That is voucher 201. The bolts referred to in that voucher were not used in the actual construction of the culvert, but they were used for bolting the centering together, so that there is really very little difference. As to voucher 327, the whole of the amount was for the repair of tools used upon the work. I allowed an amount of 11s. 9d. for the blacksmith, but Mr. Smith says that 8s. 3d. of this amount is for sharpening road-picks, &c. The whole of these tools were used upon the work of the culvert and that work only. The men upon the road keep their own tools, and therefore that would not interfere with this item.

10543. *His Honor.*] The expenditure would be for the sharpening of picks used for the excavation for the piers and the trenching? Yes.

10544. *Mr. Parkes.*] What is the next item? Vouchers 467, 468, 469. They are Water and Sewerage Board's charges for the removal of the main, and were consequent upon this unnecessarily large culvert being put in. Then as to the question of wages upon voucher 189, Mr. Smith says that Isles did all the carting for the culvert. Isles did not do all the carting for the culvert but merely the cartage of plant to the work. W. Thompson, the road carter, did most of it, such as the carting of gravel and sand from the railway, the metal to make good the roadway, the spoil from the excavation, and the removal of plant, &c. Mr. Smith in what he says as to this item shows that he did not know as much about the matter as I did myself.

10545. *His Honor.*] What carting did Isles do? The only carting he did was to take the plant out to the work. No record was kept, but the whole of the carting done by Thompson would probably amount to £6, that is allowing twelve days for one man with a horse and cart. That I did not bring into my account before.

10546. What is the next item? Vouchers 190, 224, 270, 363, 414. Approximately the whole of these wages had to do directly or indirectly with the construction of this culvert, and consequently are a correct charge against it. The division of time I look upon as fictitious,—that is to say, the old rotten brick structure was scarcely any hindrance to excavating the trench for the new one. The cutting of the outlet drain is also mentioned, whereas this item of work was done prior to the work of the culvert being commenced. I have a distinct recollection of sending two men to cut this drain. I was asked to send men to clear out the drain in order to get a proper level. That was done before the culvert was touched.

10547. *His Honor.*] In what account does the cutting of the outlet drain appear? It formed part of the maintenance of the road. I distinctly remember sending two men to do the work; Mr. Smith puts it down here as an excuse. He says that the two men were partly engaged upon that work while the culvert was in construction, whereas it was done before the culvert was commenced. As to voucher 220, the item there has to do with the preparing of the centering for the culvert. Although I did not certify to that voucher I know that all the man did was to prepare the centering for this culvert. It was prepared at Iron Cove and carted out. Mr. Smith's statement as to the man Davis or Davidson is incomprehensible. The man's time, forty-nine and a-half days, I believe to be correct. He was on the work until nearly the finish, and certainly did not go to the gas works bridge until September. These deductions of £48 2s., as represented by the above items, are fictitious. There is altogether a sum of £109 15s. 5d. which must be added to Mr. Smith's total of £109 18s. 9d.

10548. *Mr. Parkes.*] Do you solemnly declare that of your own knowledge that is the cost of the culvert? It is not the total cost of the culvert, because there are other items which have not been included.

10549. But all the expenditure you have given was in connection with the culvert? I do not say that it was all expenditure upon the actual walls of the culvert, but it was all upon work incidental to it.

10550. When you were last here some reference was made to moneys which had been taken from the Main Southern and Western Road accounts and used on this Monier culvert and for other purposes for which it was not intended. You said then that you could not call to mind any instances in which that had been done, but you have since found evidence in support of your statement? I have no recollection of any other amounts beyond those I have given being expended upon this culvert, but I have found vouchers showing that money has been paid for certain objects when it was voted for totally different objects.

10551. Will you give us some instances? Yes. I have a list of vouchers paid from the Parramatta district votes for wages and other matters not applying to the district. Take voucher 475 in 1892. Brown and others were working in the Sydney district, but the amount was charged to the Main Windsor Road to the extent of £42 13s. 6d. The men were not within 20 miles of the road.

10552. What was the particular work upon which the men were engaged? Brown and Byrnes were working near Sydney—between Ashfield and Sydney I think. I do not know where the others were working.

10553. What are the other cases? There is voucher 498, also for the year 1892. It is an amount of £2 to Mr. W. A. Smith for work presumed to be done and expenses presumed to have been incurred for supervision in the Parramatta district, whereas his voucher states that on May 13th the expenses were incurred in going to Hornsby and Galston, in a different district. The amount was nevertheless charged to the Parramatta district. Then there is voucher 925. The amount is £55 11s. 6d. for Wells and others. They were working in the Metropolitan district, and the amount was charged to the Main Southern Road. The next voucher is No. 18, in the year 1893, and it is for an amount of £39 5s. 9d. for Mr. W. A. Smith, extra travelling allowance while in charge of the Metropolitan Division. I have not put it in my list. It is certified to as extra travelling allowance, and although it did not apply to my district it is charged to the Main Southern Road.

10554. *Mr. Parkes.*] Is there any minute upon that voucher? Yes; there is a minute from the Examiner of Accounts to Mr. W. A. Smith as to authority. Mr. Smith says, "See Commissioner's minute of 5/2/92 on papers 91-9,336 herewith attached. The conditions under which the Commissioner wrote this minute are unaltered." The Commissioner's minute is not here. Mr. Hickson wrote the following minute: "Mr. Smith, with reference to our conversation this morning." He afterwards wrote another minute in which he said, "As Mr. Smith had to keep (owing to the extensive district under his charge, from the Hawkesbury to National Park, and as far as Penrith) an expensive equipment and establishment his allowance was fixed at the highest rate, viz., £175 per annum." 10555.

10555. Was that amount paid out of the Main Southern Road? Yes. The other items are vouchers— J. Symonds.  
430 in the year 1893, representing £5 for Mr. W. A. Smith, of which only £1 applies to the Parramatta District; voucher 277, a payment to W. Larkin of £18 15s., and charged to the Main Southern Road, 31 July, 1896.  
although he was foreman in Sydney; voucher 418, a payment of £32 10s. to Larkin and another, also charged to the Main Southern Road; voucher 518, a payment of £13 to T. Wells, also charged against the Main Southern Road; voucher 551, a payment to Mr. W. A. Smith, £6 18s. 8d., being charged to the district, and only one item applying; voucher 298, a payment to Mr. W. A. Smith, £12 0s. 11d., and one item only applying; and voucher 419, also a payment to Mr. W. A. Smith, £9 14s. 5d., being charged, and only one item applying. I have taken these items as being among the most conspicuous. There are various others which I have not taken, and about which there might be some quibbling as to their being partly chargeable to the district.
10556. As to Mr. Bramston, Mr. Smith says that he worked upon this culvert only for a few days;—what do you know of him and his payments? I should not have returned him as working upon the culvert if he were not there.
10557. It was you who made out his vouchers? They were made out in my office, and I signed them as being fairly chargeable against the work.
10558. Can you positively declare that Mr. Bramston worked at this culvert during the time to which you have certified? For the greater part of the time.
10559. Was he away from the work for any time? He might have been away for half a day. He might have gone once or twice a week as far as the Gas Works Bridge at Parramatta; some painting was going on there and he had to go occasionally to look at it.
10560. But his constant work was in the supervision of this culvert? Yes; Mr. Smith distinctly said that he wanted Mr. Bramston to be there.
10561. *His Honor.*] You have not analysed the accounts and made an estimate to institute an exact comparison between the cost of the Monier arch work and the cost of either brick arch work or a buckle-plate covering in substitution for it? No; I have not gone into that matter. The work was undertaken upon false premises. It was stated to be 50 per cent. cheaper and it proved to be 100 per cent. dearer.
10562. *Mr. Davis.*] Mr. W. A. Smith had charge of the Parramatta district as District Engineer? Yes.
10563. Would it not be a legitimate thing to pay from the Parramatta district vote part of his expenses? Yes; I have left out the items having to do with travelling expenses in that district.
10564. As to the work being performed in other districts outside of the Parramatta district, and paid from the Parramatta district vote, I suppose the work was faithfully performed—there is no question about that? My point is that it was against the Audit Act, and Mr. Smith must have known it.
10565. But there is no question about the work having been performed? I do not know; probably the men were working in Sydney district.
10566. You have no reason to suppose that they were not working? No; but they were not working in the district to which their wages were charged.
10567. As to the Monier culvert, your son had charge of it under Mr. Smith? Yes, he attended there every day.
10568. He worked immediately under Mr. Smith? Yes.
10569. That being so you had nothing whatever to do with the work except to pass the vouchers through your accounts? There were various things to be done; for instance, there was the carting. I distinctly remember telling a carter to go to the culvert and do anything that was required.
10570. But you left the details of the work to your son? Yes, and to Mr. Bramston.
10571. And they worked in conjunction with Mr. Smith? Yes; but it does not follow that I knew nothing about it.
10572. So that Mr. Smith would be likely also to know something about it? Yes, of course.
10573. *His Honor.*] Mr. Bramston was an Inspector employed generally by the Department? Yes, for inspecting such jobs as this.
10574. *Mr. Davis.*] Was his employment continuous? It was continuous at that time. As an Inspector for the Metropolitan District he would supervise small jobs. He would be on the job to see to the men's time.
10575. *His Honor.*] Without being permanently engaged, he was employed as continuously as if he were? No not continuously, because as happened shortly afterwards there was no work and he was discharged. As long as there was work going on he was kept on.
10576. He might be told to go on to more work at the time that this particular culvert was in construction? Yes.
10577. If there were two works within a distance of 1 or 2 miles of each other going on at the same time he would be employed upon both works as an inspector? Possibly, if they were not important works.
10578. Culverts, and works of that kind? Yes.
10579. *Mr. Parkes.*] Did that happen in this instance? There was only the other work which I have mentioned—that is, the painting of the Parramatta Bridge. He used to go there occasionally to look at that work. There would be no reason for him to be there specially, because the work was near my office, and I used to supervise it myself. This culvert was his special work at the time.
10580. I suppose there can be no doubt that the Monier arch was cheaper than a brick arch over the culvert, taking the arch alone? I cannot see any reason for saying that it was cheaper. It was certainly dearer from the way in which it was carried out.
10581. Have you taken out the quantities to see;—have you separated the vouchers for the Monier work itself? You cannot get at it from the vouchers or anything in my office. I remember my son giving me a slip of paper at the conclusion of the work, from which it was shown that the arch had cost so much money. That is the only way I got at the cost.
10582. Did he say that the Monier arch cost more than a brick arch would have cost? I do not think we discussed the matter.

John Carter recalled and further examined :—

J. Carter. 10583. *His Honor.*] I believe you wish to make a statement? Yes. I was asked the other day a question in connection with my financial dealings with Mr. Weedon. I was asked if I did not give him a promissory-note. On being asked that question, I at first thought I had done so. I remember that the question had been discussed and that a promissory-note had been written. I afterwards found that it had not been handed over to Mr. Weedon. That statement has not been corrected by any other evidence I have since given. I had to appeal to Mr. Weedon before I could be quite sure of the circumstances. The number of the question to which I refer is 7629.

10584. *Mr. Parkes.*] You say that you did not give Mr. Weedon a promissory-note? No.

Joseph Davis recalled and further examined :—

J. Davis. 10585. *Mr. Parkes.*] Will you read Mr. Hickson's minute upon the document which I now hand you, in connection with the sureties for Mr. Ahearne's contract? Yes. He says,—“I recommend that Mr. Ahearne be asked if Mr. M'Ardle has property to the value of the penal sum required in the Colony. If not, he should be asked to give the name of someone who has.”

10586. Mr. M'Ardle was proposed as personal security for Mr. Ahearne's job? Yes, in conjunction with Mr. Henry Hudson, of Darling Point.

10587. Is it not the practice of the Government to take sureties only from those who have landed property in the Colony? I do not think so.

10588. Is it not the only tangible security they can have? I think the Department would take a man like Mr. Henry Hudson without going into the thing at all. He is known to be a stable man. In this instance, Mr. M'Ardle was an unknown man.

10589. Mr. Hickson asked if he had landed property in the Colony? Yes. He evidently had some doubt in his mind.

10590. Will you read the declaration recently made by Mr. Gillan in Adelaide, which I now hand you? Yes. It is as follows :—

IN THE MATTER OF THE PUBLIC WORKS INQUIRY COMMISSION.

I, JAMES GILLAN, of Clarendon, in the province of South Australia, contractor, do solemnly and sincerely declare as follows :—

1. All the property now beneficially held by me is of the value of not less than £6,000, as I verily believe, and consists of the items following, that is to say :—

|  | Approximately. |
|--|----------------|
| In the Bank of New Zealand at Adelaide.....  | £550 0 0       |
| In the Bank of New Zealand at Sydney .....   | 115 0 0        |
| Bank fixed deposit receipts and interest .....   | 1,015 0 0      |
| Personal effects in South Australia, including furniture, piano, horse, harness, and sundries—market value ..... | 300 0 0        |
| Six shares in Adelaide prospecting syndicate—market value .....  | 60 0 0         |
| Shares in Town and Country Building Society, Sydney—market value .....   | 50 0 0         |
| Money due me by Carter, Gummow, & Co., for money lent.....   | 1,000 0 0      |
| My interest as partner of Carter, Gummow, & Co., in the surplus assets of that firm .....                        | 3,100 0 0      |
|  | £6,190 0 0     |

2. My personal liabilities, exclusive of my liability (if any) under the bond for £6,000 executed in or about the month of May, 1895, do not exceed £20 to the best of my knowledge, information, and belief.

3. There are no mortgages or bills of sale on any of my said property.

And I make this solemn declaration conscientiously believing the same to be true, and by virtue of the provisions of an Act made and passed in the sixth year of the reign of His Majesty King William the Fourth, intituled “An Act to Repeal an Act of the present Session of Parliament, intituled ‘An Act for the more effectual Abolition of Oaths and Affirmations taken and made in various Departments of the State, and to substitute Declarations in lieu thereof and for the more entire suppression of Voluntary and Extra-Judicial Oaths and Affidavits’ and to make other provisions for the abolition of unnecessary Oaths.”

JAMES GILLAN.

Declared at Adelaide the 17th day of July, 1896, before me,—

WM. HENDERSON,  
Notary Public.

10591. You see from that declaration that Mr. Gillan had no landed property at that time in this Colony ;—is not that so? It does not appear from the declaration that he had.

10592. Is there any fixed security named in the declaration ;—is there any item which is not a movable security? I should say that landed property, seeing that it could be sold, would be almost as movable a security, from one point of view, as a great many of these items.

10593. All the moneys referred to could be drawn out of the bank at a moment's notice? Yes, and landed property could be sold.

10594. You notice that he mentions £3,100 as representing his interest in Carter, Gummow, & Co.'s business? Yes.

10595. Then there can be no doubt as to Mr. Gillan being a partner in the firm of Carter, Gummow, & Co.? He says that on 17th July, 1896, he was a partner.

10596. He mentioned that his interest in the firm of Carter, Gummow, & Co. in respect of contracts now going on amounted to £3,100? Yes.

10597. Do you think he was a proper surety to take for Contract 77 in connection with the substitution of the Monier design? I can give you my opinion for what it is worth.

10598. Would you consider him a proper surety? I should say that he was a stable man.

10599. But, having regard to his interest in the firm, and seeing that he had no landed property in the Colony, where is the security? If the Department had found Mr. Gillan's name at the foot of the tender as a partner of the firm of Carter, Gummow, & Co., which was not the case, and if Carter, Gummow, & Co. had asked the Department to take Mr. Gillan as a surety, they would have refused him point blank.

10600. Did they not know well that Mr. Gillan was a member of the firm of Carter, Gummow, & Co.? They knew that he had been associated with the firm for some years—at one time with Mr. Gummow, and more recently with Mr. Carter, in various jobs. At the same time the Department had to do what any other reasonable person would do in the circumstances; they saw at the foot of the tender the names of Messrs. Carter, Snodgrass, and Gummow. It did not appear that a Mr. Gillan was, as you suggest, a member of the firm.

10601.

10601. Did the Department make the slightest effort to find out whether Mr. Gillan was connected with the firm or not? I cannot say. It was no part of my duty. J. Davis.  
 10602. Did you hear of anyone else making inquiry in that direction? It was no part of my duty whatever. 31 July, 1896.  
 10603. *Mr. Norrie.*] Will you look at Mr. M'Ardle's address given in Mr. Ahearne's letter? Yes. Brisbane is given in the first instance. That is scratched out and Sydney is put in. I should imagine that seeing that Mr. M'Ardle was a Brisbane man Mr. Hickson would very properly write the minute to which Mr. Parkes has referred, not knowing anything about him.

*MONDAY, 3 AUGUST, 1896.*

William Henry Warren recalled, and further examined:—

10604. *His Honor.*] You now have ready the report you were asked to make to the Commission as to the value of the aqueduct in the original plan of Contract 77, and also in the substituted Monier plan? Yes. I met Mr. M'Creddie, Mr. Thompson, and Mr. Davis, and we agreed as to the quantities. I have a list signed by those three gentlemen giving the quantities in each case, and upon those quantities I have based an estimate. My first estimate deals with the Monier plan, and in that case the total is £15,565 6s. 5½d.; the value of the Departmental design I make £15,789 10s. 6d. That estimate was based upon the prices in the schedule less the 28½ per cent. My third estimate is based upon the same quantities, but I put in the prices myself, and I make the total £17,660. W. H. Warren.  
3 Aug., 1896.  
 10605. That is for the whole contract? Yes. I may mention that in each case I have added to the value of the aqueduct work £6,362 2s., in accordance with the estimates given to me by Mr. Davis, and to which Mr. Thompson and Mr. M'Creddie agreed. That amount represents the quantities common to both designs, exclusive of the aqueducts.  
 10606. Will you first give us the details of your estimate in the case of the Monier plan? Yes. My report concerning both designs is as follows:—

ESTIMATE of the total cost of the Aqueducts and Tunnels in the Contract.

| Quantity.         | Description.   | Rate.                   | £       | s. | d. | £     | s. | d. |
|-------------------|--|-------------------------|---------|----|----|-------|----|----|
| 1,533 cub. yds... | Material above skewbacks in Monier system                  | @ £3 19s. 6½d. cub. yd. | 6,098   | 15 | 8  |       |    |    |
| 18.2 tons .....   | of ironwork .....  | @ £14 per ton .....     | 254     | 16 | 0  |       |    |    |
| 140 .....         | Expansion joints, at 2½ cwt. each = 15.75 tons.....        | @ £11 10s. per ton ...  | 181     | 2  | 6  |       |    |    |
| 10,625 .....      | Squads of rendering, 1 to 1 .....                          | @ ls. 9½d. ....         | 951     | 16 | 5½ |       |    |    |
|                   |  |                         |         |    |    | 7,486 | 10 | 7½ |
| 158½ cub. yds.    | Bluestone concrete .....                                   | @ £2 10s. cub. yd. ...  | 396     | 13 | 4  |       |    |    |
| 1,350 ,, ..       | Sandstone concrete.....                                    | @ £1 8s. ,, ...         | 1,890   | 0  | 0  |       |    |    |
| 1,016 sq. yds.    | Rendering, 2 to 1 .....                                    | @ 2s. 3d. sq. yd. ....  | 114     | 6  | 0  |       |    |    |
|                   |  |                         | 2,400   | 19 | 4  |       |    |    |
|                   | Less 28½ per cent. ....                                    |                         | 684     | 5  | 6  |       |    |    |
|                   | Add cost of the remainder of contract in tunnels, &c. .... |                         |         |    |    | 1,716 | 13 | 10 |
|                   |  |                         |         |    |    | 6,362 | 2  | 0  |
|                   | Total cost of contract .....                               |                         | £15,565 | 6  | 5½ |       |    |    |

SUMMARY.

ESTIMATED Cost of Monier Arch structure complete, per cubic yard.

|  |    |    |    |   |
|--|----|----|----|---|
| Compo. and concrete in arch and carrier .....                              | £  | 1  | 11 | 6 |
| Labour in do. ....   | 0  | 17 | 2½ |   |
| Supervision .....  | 0  | 5  | 0  |   |
| Grillage.....  | 0  | 5  | 6  |   |
| Plant .....  | 0  | 2  | 5  |   |
| Timber .....   | 0  | 7  | 6½ |   |
|  | £3 | 9  | 2½ |   |
| Add 15 per cent. profit, royalty, and risk, &c., including guarantee ..... | 0  | 10 | 4½ |   |
|  | £3 | 19 | 6¾ |   |

TIMBER in Centering and Boxing.

|   |       |             |
|---|-------|-------------|
| Timber in ribs.....   | 280   | cub. ft.    |

W. H.  
Warren.

3 Aug., 1896.

10607. *Mr. Davis.*] With reference to the 15 per cent. allowed for profit, risk, and royalty, what would you say is the usual percentage with which the contractor would be satisfied, as far as profit is concerned? I think 10 per cent. might be considered a fair thing.

10608. As to risk, I may inform you that it has been stated in evidence that the Department has entered into an agreement with Carter, Gummow, & Co., that it will pay 15 per cent. royalty upon any Monier arch the Department may construct;—with that fact in your mind, what would you say with regard to royalty. You have allowed 15 per cent. for profit, risk, and royalty—what would be a fair thing to allow for royalty? I have practically given nothing for the royalty. I have taken it that, this being the first occasion that a work of this kind has been constructed, the patentee should be prepared to make some sacrifice.

10609. You did not allow anything for royalty then? Of course, I knew there must be a royalty, and I knew there would be a risk. I knew that the contractors had to give a guarantee. I also considered the question of profit: and I have taken 15 per cent. as against these three items. Of course, if you are to add 10 per cent. for profit to 15 per cent. for royalty the amount would have to be 25 per cent., and that would include nothing for risk.

10610. As to the question of risk it has been stated in evidence that the bond into which Carter, Gummow, & Co. entered with the Department provided for a three years guarantee. You have not reckoned royalty at all. You have allowed 10 per cent. for profit and risk, deducting the profit. Do you think there is sufficient margin left to cover the risk. There is a three years guarantee of £12,000 a year? Of course, that is a big sum, 5 per cent. would give you £600 a year for three years. That would make £1,800 for the term. As regards these matters, I am, of course, open to correction. I have cut down the amount under this heading. Of course, under the circumstances you name, the contractors would be entitled to something more.

10611. It is usual to pay for risk? Yes.

10612. Supposing some one took the risk of a structure, which in this country might be regarded to some extent as novel, I suppose the risk would be worth something? Undoubtedly.

10613. And you have allowed only £380? I have only allowed that for everything.

10614. So that if more than that amount were allowed you do not think it would be out of the way? No; I do not.

10615. Coming now to the £6,362 2s., the estimate according to the schedule rate for the portions of the contract not included in the aqueduct. On 22nd June Mr. Thompson, in giving evidence as to the cost of the contract according to his estimate, handed in a document headed "Contract No. 77. Memo. of quantities outside of aqueducts—Departmental—including footings to the same not previously measured." He says, "I have checked the various items in the Government schedule, and I have so closely agreed with them as to adopt them here." What is the total amount? £6,362 2s.

10616. So that that is slightly in excess of the total which you have attached to your estimates? Yes.

10617. Might not that be accounted for by the note at the heading, where Mr. Thompson said, "Quantities outside of the aqueducts—Departmental—including footings, &c."? That would account for it probably. The sum would be about £300.

10618. You have had some experience as to what mixtures of concrete will make when deposited in the work, compared with quantities of the material measured separately on a concrete board? Yes.

10619. Would you say that the size of the stone had anything to do with the bulking of the concrete? Yes; it has a great deal to do with it.

10620. Furthermore, would you say that taking stone broken with a hammer—that is, knapped—and stone broken with a Blake's crusher, there would be any difference in the bulking? Yes; it would affect the quantity of small stuff, which would fill up the interstitial spaces.

10621. Would you say this—that it would depend entirely upon the size of the stone first of all, and secondly upon the proportion of small stone in any given size, as to what quantity there would be in the concrete in position? Yes; it depends upon that undoubtedly. The concrete is simply united by the cement mortar which fills up the interstitial spaces. The smaller stone would do that to some extent, and would therefore leave smaller interstitial spaces to be filled up with the cement mortar.

10622. Supposing you take stone of a 2-inch gauge and you mix a batch of concrete with stone approximately all that gauge, and suppose you have another batch of concrete mixed with stone varying from a 2-inch gauge down to the size of a pea, would the second batch make more in the work than the first? If you use small stuff to fill up the interstitial spaces it will go further. You will get a greater number of cubic feet.

10623. In other words, it amounts to this—that when you have all the voids filled with the compo. the balance of the compo. goes to bulk in the concrete? Yes.

10624. And the greater the aggregate used in proportion to the cement and the sand the less would be the bulk of the concrete in position? Yes.

10625. I have here a book by Mr. G. L. Sutcliffe, Associate of the Royal Institute of British Architects, upon "Concrete, its Nature and Uses." He says:—

The test No. 8 is one of a series given by Lieut.-Colonel Gillmore in his book on "Limes, Hydraulic Cements, and Mortars." He succeeded in obtaining aggregates with a minimum percentage of voids; ordinary limestone was crushed by a Blake's stone-breaker into pieces of all sizes below 2-inch cubes, and into various shapes; and gravel was obtained from the seashore, consisting, after the sand had been screened out, of pieces varying "from the size of a pea to that of a hen's egg." He found that the least amount of voids occurred in those mixtures which contained 15 measures of gravel and from 11 to 15 measures of broken stone. The worst mixture (15 to 27) contained only 30 per cent. of voids. The best (15 to 13) contained 23 per cent. This is a vast improvement on the voids mentioned above for broken stone of nearly uniform size. Solid concrete made from the latter would be 20 to 30 per cent. weaker than that made from the former, while the cost of the two would be practically the same. Roughly speaking the bulk of Portland cement is, according to Mr. Sandeman, reduced 10 per cent., and of sand 20 per cent., by mixing with water, and the contraction in volume caused by mixing sand and cement together is about 5 per cent. According to Mr. Sandeman, a further contraction of 4 per cent. takes place during the setting of the mortar. From these data we may calculate that cement and sand, 1 to 1, will produce mortar about 76 per cent. of their volume; 1 to 2 about 74 per cent., and 1 to 3 about 73 per cent.

Assuming that to be a correct statement, would you say that concrete made with an aggregate varying from 2 inches to a pea would be the better concrete? Yes.

10626. As to your experience, does it confirm that statement? Undoubtedly.

10627. So that if the stone used in this work has been broken with a Blake stone-breaker, and has varied from the size of a pea to 2 inches in the case of the sandstone concrete, and from the size of a pea to 1½ inch

W. H.  
Warren.

3 Aug., 1896.

inch in the case of the bluestone concrete, you would approve of it? Yes. I say that, in view of the results of the testing of over 1,000 pieces of concrete. My test-book, which is in the hands of the Commission, will show the mixtures I have used. I think you will find in the book similar mixtures to those which you have described. No doubt that is the best way to make concrete.

10628. It is desirable to reduce the voids as far as possible? That is the way to get the strongest concrete for the least money.

10629. It would tell in the bulking also; would it not? Yes; it would make the bulk come out better.

10630. I have here another authority upon masonry construction, by Ira O. Baker, Professor of Civil Engineering, University of Illinois. He mentions the composition of concrete used in Boston Harbour—cement, sand, and gravel. The total materials used to a cubic yard of concrete amount to what? 1·27 cubic yards—0·83 bushels of cement,  $\frac{1}{4}$  cubic yard of sand, and 9-10ths of a cubic yard of gravel, at a total cost of 2 dol. 11 cents per cubic yard in place.

10631. The total quantity of the materials was 1·27 cubic yards? Yes.

10632. Baker gives another case of 10,000 cubic yards of concrete, as laid for the foundations of a blast furnace plant near Troy, N.Y., in 1886;—what quantities of material were used in that case? 1·23 bushels of cement, 0·10 cubic yard of sand, 0·36 cubic yard of gravel, 0·74 cubic yard of broken stone, making a total of 1·28 cubic yards. I notice that gravel and broken stone are mixed in that case. The total cost per cubic yard of the concrete in place was 3 dollars 52 cents as against 2 dollars 11 cents in the other case. These facts are taken from the Transactions of the American Society of Civil Engineers.

10633. *His Honor.*] It all comes to this,—that if you can so arrange your size of stone as to fill up all the interstices, and have no voids at all—making the body as dense as possible when the concrete is set—you make the best concrete? Yes.

10634. And if you find an increase in the bulk of the stuff after finally mixing or setting, it is to be presumed that the voids are all filled, and that the body is dense? Yes.

10635. It is good concrete then? Yes.

10636. If you find no increase in size you do not know whether the body is compact or not? Quite so.

10637. You cannot say how far it is wanting in compactness? It might be just short.

10638. It might be a good deal short for aught you know? Yes.

10639. And as regards filling up your interstices with stone, so long as the cement passes right through the whole body fairly and equally, and mixes with it, it is just as good a material as if the interstices had been actually filled up with cement? Yes; as long as each stone is covered with cement mortar. That is the point. Here, again, the adhesion of the cement to the material comes in and governs the matter. It is not the tensile strength of the cement.

10640. The object would be to get such a mixture of stone as would make the interstitial spaces an absolute minimum so long as there was sufficient room for a bonding quantity of cement to run right through it? Yes; that would be a perfect concrete. Of course the interstitial spaces vary slightly. The best thing is to try the materials at hand, and ascertain how you can best use them. That is always done.

10641. It is not good policy, then, in any relation to confine yourself to a single size of stone? No, certainly not. Then you use the maximum quantity of mortar, you get a weaker material, and it costs more money.

10642. You waste the cement without getting any advantage? Yes.

10643. *Mr. Parkes.*] In giving your evidence upon July 17th, you quoted from a number of authorities as to the strains upon brick arches, stone arches, and the Monier and other patents? Yes.

10644. Had you any means of finding out whether the material used in the arches to which you referred—taking the bricks for instance—was as good as that used here? They would be pretty much the same class of bricks.

10645. Have you seen the bricks? I saw a lot of brickwork and a lot of concrete work in Austria.

10646. Did you see these particular tests made? No; but it is stated that the materials were of the best description.

10647. You cannot guarantee the material in the same way that you could do in this Colony? No; it would probably not be as good as you would have here.

10648. Then so far as the quotations you made from various publications are concerned, they would have very little effect upon the case with which we are dealing? On the contrary, they would have a very great effect, because even assuming that the bricks in the arches were a little better or a little worse the result depends much more upon the cement mortar. That is one reason why a brick arch is less strong than a concrete arch. In a concrete arch you get over the joints. The results I gave are substantially correct. We should get similar results here if we repeated the experiments.

10649. Are not these tests made by those who are specially interested in the systems in connection with which they were made? No. In this case the experiments were made by a committee appointed by the Austrian Government—by several professors of engineering in universities, and by a number of leading architects and engineers. Of course the persons immediately interested would be certain to be represented—that is the case in all such tests.

10650. Do you know this of your own knowledge? Well, it is quoted in several books of the Proceedings of the Austrian Society.

10651. Have you the papers in your possession? I could obtain possession of them.

10652. Will you produce them? I will endeavour to do so.

10653. You yourself have made no tests of the Monier system other than those you made of the plates sent to you by Mr. Davis? No.

10654. Have you submitted your estimates to the Department before producing them to the Commission? No.

10655. Had you any conversation with Mr. Davis, or with any officer of the Department, between the time at which you agreed with Mr. Thompson and Mr. McCredie as to the quantities and the time of your coming here? No; I cannot remember that I saw Mr. Davis. I remember asking him about the 15 per cent. royalty, but I think Mr. Thompson was present at that time.

10656. When you gave evidence on a former occasion, you put down for the compo. which goes into the arches £1 7s. 6d. for material and 7s. 6d. for the iron mesh, making a total of £1 15s.? I think those are my figures, but I have not the memorandum by me now.

10657.

- W. H. Warren.  
3 Aug., 1896.
10657. You put down labour at £1? Yes; I remember that item particularly.
10658. Does it remain at £1 in the report which you have made to-day? I made my estimate of £1 without taking anything like the trouble I have since taken. I have since been to the work three times. I have made measurements, and I am thoroughly satisfied as to the estimate which I now give.
10659. Do you think the work would cost £1 a yard;—do you not say in your report to-day that it will cost only 17s. 6d.? Yes; I think those are the figures.
10660. How many yards are there in each of the arches—there are about 25, are there not? I have not taken out the quantities in that way.
10661. Take an arch 78 feet long, 7 feet 6 inches in width, and 14 inches in depth—what would be the approximate measurement in yards? Say 24 cubic yards.
10662. Then, according to the estimate you have given to-day, it would take forty-one men to put the arch in? I saw fourteen men working at the time I was there.
10663. But were forty-one men working upon the arch? Not upon the arch I saw.
10664. You have mentioned in your report to-day twelve men? Ten men would be working at the spandrell.
10665. If ten men were working at an average of 5s. for two days, that would give £5 for the arch;—could not those ten men do the whole work? There were fourteen men engaged in putting the concrete into the arch. I have given only ten men, I think.
10666. Were all the fourteen men working upon the arch? Yes. Some were mixing the concrete, some were screening, others were wheeling it in barrows, others were receiving the contents of the barrows and so on.
10667. We will take fourteen as the average;—supposing you take £7 for the fourteen men, what would that run out to? That would be a little over 5s. a yard.
10668. Is not that a fair price for this work? You have not taken in the timbering and several other things.
10669. Is not 5s. a fair allowance for the work of putting in the arch;—supposing there were 14 men, could those men not put up the timbering and the ironwork on another day? I do not think so.
10670. Your average, according to the figures you present to-day, is 17s. 6d. per yard, including everything? Yes.
10671. Do you not think that is an excessive price? I do not, indeed.
10672. It would take, on the average, forty-one men to do the work, bit by bit, day by day, to make up your estimate of 17s. 6d. The men would be falling over one another? They are not all on the arch. Some would be on the platform, some would be working in the blacksmith's shop cutting up the iron, others would be engaged in putting the iron together.
10673. There would have to be forty-one men constantly employed upon the work to make up your estimate of 17s. 6d.; but you say that you saw only fourteen? There were fourteen doing the piece of work I saw. They were engaged upon the arch; but I suppose other men would be engaged in putting the iron together and making preparations for the next arch. It does not follow that all the men employed would be actually engaged in putting in the one arch which I saw being put in.
10674. But what would the other men be doing? They would be engaged in various other kinds of work which would have to be taken into account in making an estimate of the cost of the work as a whole. I take it, for instance, that the grid would be made by one set of men, and that another set of men would be engaged upon the compo.
10675. But you have said that the arch is all made in the one day? As regards the compo.
10676. Then the fourteen men who would be engaged putting in the compo. at a cost of 5s. would be idle while the arch work was coming on unless they were doing the ironwork. You have said that forty-one men were engaged? I did not say that.
10677. You will find that if you work out your 17s. 6d. it will mean forty-one men—do you not think the better plan would be to look at the contractors' papers and see what they actually paid;—would not that be the best method of arriving at the total? I suppose it would be.
10678. Did you watch the men working at any other time than the one day you have mentioned? I went down there three days. On one day they were not working.
10679. You have not seen the work in connection with one of these arches go right through—you have not seen the labour actually employed upon it? I have not seen all the work of course, but I saw how the work would be done. I saw that it was necessary, for instance, to make a grid, quite apart from the other work, and to bind it and shape it. That would be done the day before it was put into position, I presume.
10680. The work you saw done there on the contract on Thursday afternoon last was being done on a special occasion? Well, it was raining hard. I do not know that there was anything special about the occasion apart from that.
10681. How was the material put in—were the fourteen men you saw sitting on the arch? No. The men were on the scaffolding.
10682. Doing what? Putting in the material.
10683. They were all about the arch? Yes.
10684. With what were they putting in the material—with teaspoons? They were putting it on in the ordinary way. The barrow-loads were emptied, and the material was then spread out and rammed in.
10685. Rammed in with what? Rammers.
10686. Did it take fourteen men to put in with rammers the barrow-tippings of material? I saw fourteen men there at the work.
10687. How long were you on the works;—were you there an entire day? I was there about an hour.
10688. And fourteen men were then engaged upon the work? Yes.
10689. As to the timbering—you put down 10s. 6d. a yard for timbering;—do you still adhere to that, or have you altered the whole of your evidence? I have not altered any.
10690. Then you adhere to the 10s. 6d. you formerly gave for timbering? That estimate was made up from my own idea of the work, but I have since measured it up.
10691. How many centres were being used at a time? Four centres.
10692. Evidence has been given that only two centres are used at a time, and even supposing four centres are being used now, your estimate of 10s. 6d. is spread over the whole material, is it not;—is the timber left

W. H.  
Warren.

3 Aug., 1896.

left in the whole of the four bays as the work goes on;—when they are making an arch would they have left the timber in all the other bays, or would it have been taken down? There were four centres standing there.

10693. But they are re-using the timber;—there is no doubt about that? They would require four centres for the aqueducts.

10694. How many were up when you were there? There were four about altogether.

10695. You mean fixed in position over the arch? In some cases they were ready for the building of the arch.

10696. How many were actually fixed in their places when you were there? Two were actually in use.

10697. The two centerings being actually in use in two arches, but you have taken 10s. 6d. per yard over the whole material? Yes; there were four centres, as I have explained.

10698. But you have taken 10s. 6d. for each yard of material? 7s. 6d.

10699. According to your former estimate it was 10s. 6d., but, taking it at 7s. 6d., what is your total? There are 732 cubic feet and 7,517 superficial feet in one centering. I have multiplied that by 4, and the total cost comes out at £561 8s.

10700. £234 for the timber in each bay, is it not? £140. I have estimated it for four.

10701. But only two of them, you say, were in place? I am supposing that four centres would be used.

10702. But there are only two in use? There are only two in use at present.

10703. That would be £234 for each bay? The two would come to £280.

10704. You have allowed £561 8s. for the timber? Yes.

10705. And there are only two bays being used? Yes; but they will have to leave those centerings in when they proceed with other arches.

10706. Why did they not leave them in before;—they are not in the work now, according to your own evidence? Two are under the arches; the other two are on the ground; but they are all practically in use.

10707. Two are in readiness for two more arches? Yes.

10708. But not in place? No. They are not turning more than two at the present time.

10709. And you make your estimate for timber over £500? Certainly.

10710. How much per 100 is that? 13s. per 100 superficial and 2s. 6d. for the cubic foot.

10711. You have charged as if it were the best of timber put in position? Goodlet & Smith's list, I suppose, would be a check.

10712. But is the timber left in position;—is it not used again? It is used in the centerings.

10713. As a matter of fact, have you not put in an excessive price? It is a good price, but it is not an excessive price.

10714. At all events, you have reduced your 10s. 6d. to 7s. 6d.? I do not think you ought to put it in that way. Since I gave my former evidence I have taken out quantities. On the former occasion I gave merely a rough estimate. This is a more exact estimate.

10715. Coming to the question of supervision, you have allowed, in your former evidence, 8s.;—what additional plant is there? There are two galvanised sheds and an office.

10716. Is the Government supposed to pay for those? Someone has to pay for them.

10717. Do not the contractors remove those buildings? Yes, but the wear comes to something, I suppose.

10718. What is the total you have put down for plant and supervision? There are two sheds and one office. I have put in tools and barrows, just as I have put in risk and guarantee, because I knew that these things would come in. I have given a lump sum of £150.

10719. What have you put in for supervision? I have assumed that the work would last twelve months, and I have allowed £375 for supervision.

10720. If the Government keep two or three inspectors upon the work, where is the necessity for your allowance for supervision? The contractor would supervise the work, I presume, on his own account. He would probably be there himself, and I suppose he would not work for nothing.

10721. But is the contractor paying at the rate of £375 a year for supervision? I estimated that to be the value of the work.

10722. But does he pay a foreman that amount—has he an inspector to whom he pays that amount? They ought to have.

10723. But have they? Yes; I suppose they have. I cannot swear that they have. Probably one of the contractors is supervising the work himself.

10724. What about the 10 per cent. profit—is not that additional £375 an altogether fallacious item? Not at all. Supposing one of the contractors does the work himself. It is worth so much, and any profit they get is additional. The contractors may have to borrow money from the bank. They may be running the contract in that way. I do not know.

10725. Is it an item which is put in the schedule? How could it be? I have endeavoured to estimate the work in this way: I have considered what it would be likely to cost me if I had to carry it out. I have considered what would be a fair price for the work.

10726-7. But is there a clause for supervision in the estimate of the departmental design? No; there are simply schedule prices.

10728. You have not put any fancy touches upon the departmental design;—what have you allowed in the case of the departmental design for material and plant? I did precisely as I was instructed—I took the schedule prices as I had them.

10729. But have you added the things I have just mentioned on to your estimate in the case of the departmental plan? I have used exactly the same schedule in the case of the departmental plan.

10730. Will you read your details and show me where you have added these things to the items in the departmental plan? I have taken the schedule.

10731. Let us have your detailed estimate in the case of the departmental plan;—did you put in the boxing in that case? No; because it is easy to arrive at a simple thing like that. I have to give the market price. I have not to use my own judgment. It was not a complex thing like the Monier arch, where I had to go through it bit by bit and see exactly what there was in the work.

10732. You have not made your two estimates, then, on the same basis? On precisely the same basis. I have shown you exactly how I have arrived at the prices. You have the whole of the details. It is easy to arrive at the value in the case of the departmental design, but in the case of the Monier plan you cannot say at once that it will cost so much per cubic yard. You have to work it out and discover what there is in it.

10733.

- W. H. Warren.  
3 Aug., 1896.
10733. But it is a mere matter of material and labour in both cases, is it not? Yes; but in the one case we are familiar with the items, and there is no necessity to analyse the details to the same extent.
10734. When you were last under examination I asked you in regard to the elasticity of cement work, whether when the cement was over twelve months old there was any elasticity in it, and you said there certainly was. I afterwards asked you whether you could tell us of any space of concrete or cement work which had stood without cracking, and you referred to the southern section of the sewerage works as a case in point; have you seen that work lately? I saw it several years ago.
10735. To what work are you now referring? I am referring to the sewer which leads on to the sewage farm. It has been in use for some years.
10736. You are referring I presume to the sewer built by Mr. Bennett; but have you seen the outfall sewer going on to the sewage farm near Arncliffe? No. I saw those works some years ago, but a good deal has been done there since then.
10737. What is the length of the sewer Mr. Bennett built? I cannot say now. I was familiar with it at the time.
10738. Is there any great distance of aqueduct? It is not an aqueduct excepting towards the end.
10739. It is what is called an open sewer? No; there is some arching.
10740. But it is all under ground? Some is above ground.
10741. You have not lately seen the work which has been done in Contracts Nos. 101 and 112? No.
10742. I may tell you that the work upon Contract No. 101 is cracked from end to end? I should say then that there had been bad work.
10743. Does it not come from the shrinkage? I would not say that. I should say that it evidently came from bad work or bad material. Because a concrete sewer is cracked it does not follow that the concrete is a bad material for sewerage construction. It would show that in the instance to which you refer the necessary precautions were not taken. It is very unfortunate that there should have been bad work or bad material, but that does not warrant you in saying that concrete should be condemned as a material for such purposes. The suitability of concrete as a material for arches, sewers, and foundations, and for all the purposes for which it has been used, is established. It is used more than any other material for that kind of work.
10744. *His Honor.*] The question is whether either blue-metal or sandstone concrete, exposed to the weather, does not expand and contract very appreciably with changes of temperature—I believe it has been proved that it does expand and contract at about the same rate as does iron? Concrete does not expand and contract quite so much as does iron, but compo. would expand about the same as iron. Brickwork and stonework do not expand quite as much. The expansion of stone is about one-half that of iron.
10745. It has been found, by experiment, has it not, that iron, bedded in concrete and heated up to a high temperature, will not break away from the concrete in which it is bedded? That has been proved by Bauschinger, at Munich. It has been proved by getting up a furnace heat and then putting a shower bath on to the material.
10746. That being the case, a long length of concrete, having no opportunity to contract without cracking, would be likely to crack;—if, for instance, it were built in the summer, it would be likely to crack by contraction some time in the following winter? Yes; assuming that the elasticity of the compo. were not sufficient to withstand the stress that would be developed during the changes of temperature. Concrete, however, is an elastic material, and so is compo. There is no doubt whatever about that.
10747. *Mr. Parkes.*] Does compo. expand after it has been twelve months in position? If you mean that it will expand with heat and contract with cold, yes, certainly.
10748. Then it would crack? Not necessarily; it may be elastic.
10749. Supposing it were tied at both ends? Then it will develop stresses. Look, for instance, at an iron arch, which is rigid between the abutments; it contracts and expands; it will rise at the crown, but in doing so it will put an enormous stress on all the other parts of the arch amounting to 3 tons to the square inch.
10750. That is only a short length? There is one case of a work of that kind 840 feet long.
10751. That would have a roller bed? The same principle applies; it will expand under heat, and you say that it must break.
10752. You must give room for contraction and expansion in all iron construction, must you not? Nothing is absolutely rigid.
10753. You spoke on a former occasion of the porosity of cement—the sewer to which I have referred shows a uniform leakage through the cement and concrete? If there is a leakage, the work has not been properly rendered. I may mention that in Queensland Mr. Stanley has for many years used concrete in the arches of railway bridges and tunnels. Concrete has recently been adopted here in railway tunnels.
10754. As to the risk in the case of Contract No. 77, do you think it a fair thing that the Government should be called upon to pay for the risk in connection with the substituted plan? That is included in my item of 15 per cent. I had to make an estimate in connection with the entire work; but I am not an expert in every department. I have divided up my estimate so that you might have an opportunity to check and examine it.
10755. As to the making of concrete—you have given evidence to the effect that small stones may be put in as long as they fill up the interstices and there is sufficient cement in between them; but, as a matter of fact, when the specification sets forth that so much stone, so much sand, and so much cement, shall be used, ought it not to be carried out—for instance, the proportions are given as 7, 3, and 2; 4, 2, and 1; and 5, 2, and 1? Those proportions should be put in, unless the engineer makes an alteration.
10756. The substitution of the small stone tends to eliminate the cement? No, not exactly that. It means that you use less cement-mortar, because you do not require as much.
10757. You have not made any particular test yourself, with a view to carry out the specification of the Government, in connection with these contracts? I have mixed a good deal of concrete in the proportions you have named.
10758. But have you made any tests with the concrete provided in these specifications? I think so. I think I could find a number of tests which would compare with the 7, 3, and 2, to which you have referred.
10759. But have you specially made any tests in accordance with these specifications? I have not had the specifications before me; but I think I could find in my test-book twenty or thirty tests which would correspond exactly with these proportions.
- 10760.

W. H.  
Warren.

3 Aug., 1896.

10760. Would you so make your concrete that the sifting would be done through a  $\frac{1}{2}$ -inch sieve? No.
10761. You would not make concrete in that way? No.
10762. *His Honor.*] The question is this—Is it a proper thing, if the specification provides some maximum for metal, to propose that the metal for concrete, exclusive of the question of maximum and for the sake of getting rid of the small stuff, shall be screened through screens of an  $\frac{1}{8}$ -inch gauge;—does that sufficiently get rid of the small stuff that ought to be got rid of in what is called the stone, considered distinctly from the sand? The usual thing to do is to use a sieve to get rid of the smallest of the stuff in your stone. The size of the stone would vary from the size of the sieve up to the maximum size. I see no objection to that. It is commonly done.
10763. *Mr. Parkes.*] But how would you get rid of the smaller stuff? Sometimes one does not want to get rid of it.
10764. Ought not the stone to be forked? Not necessarily. You often do more harm than good by taking the fine stuff out.
10765. Would you put in the small pieces forming the residue from the  $\frac{1}{8}$ -inch sieve? I should not object to it myself; it would not affect the strength of the concrete.
10766. What I mean is this—if an  $\frac{1}{8}$ -inch sieve were used, you would not object to the use of anything which would not go through the sieve? Quite so.
10767. But what about the sand? You would have to put in less sand if you worked to the specification. Of course, if you deviated from the specification very much, in regard to the quantity of small stuff put in, some allowance would have to be made when you were putting in the sand. The putting in of the small stone would not do any harm. A great deal would depend upon the interstitial spaces which would have to be filled up.
10768. You would not put in the full quantity of 2 to 1 of sand? The quantity of sand would depend upon the quantity of small stuff put in.
10769. Have you seen the Monier work which is being done in connection with Contract 112? No; I have heard that some work of that kind is going on, but I have never been upon the work myself.
10770. *Mr. Davis.*] In connection with Contract 77 you have allowed £375 for supervision? Yes.
10771. Suppose that instead of extending over twelve months the contract extended over eighteen months? Then the supervision would be worth more. I took it at twelve months. It is one of those items which men will estimate differently.
10772. Suppose it has been given in evidence that not only has one of the contractors themselves been supervising the work, but that, for a portion of the time at least, they have employed an engineer? I think that would show that the supervision had actually cost more than I have put down for it.
10773. Referring to the bulking of concrete, Mr. McCreddie when being examined gave the following evidence:—

Will you tell His Honor what the mesh of the screen is according to the specification? Clause 26 says:—“Sandstone concrete, where ordered to be used in these works, to be composed of one part of Portland cement, two parts of sand, and five parts of sandstone (as specified under clause 16) metal, free from dirt, quarry refuse, sieved (as specified in clause 18), washed, and of a size to pass with its largest dimensions through a ring of 2 inches in diameter. All materials to be mixed in the same manner as hereinafter specified for concrete.” If you turn to clause 18 you will find the following:—“Broken stone for bluestone concrete to be of basalt or other similar hard stone of approved quality; to be broken by hand or crushing machine, of a size to pass freely with its largest dimensions through a ring of  $1\frac{1}{2}$  inches in diameter; the whole of the metal to be free from dirt, quarry refuse, &c.; to be screened through a sieve of meshes  $\frac{1}{8}$  inch apart, and then to be washed with fresh water until approved, before it shall be deemed fit and suitable for these works.”

Supposing the metal has a maximum size in the case of bluestone of  $1\frac{1}{2}$  inches, and in the case of sandstone of 2 inches, and that in order to eliminate the sand and very small particles of stone the material is passed over a sieve or screen having a mesh of an eighth of an inch, do you think that would comply with what I have read to you? Not strictly, perhaps, with what you have read, but it is the usual practice to make concrete in that way.

10774. Would that not make the best description of concrete? Undoubtedly.
10775. Is it not a fact that, in order to get the concrete as impervious as possible, where there is a big head of water, it is usual to put in shivers in addition to the small stone which is found in the broken stone itself? Yes. In the case of bluestone with shivers, one cask of cement, three of sand, and six of stone will make about 33 feet of concrete. There would be a good proportion of shivers; the 2 inches in one of the cases you have referred to would be the maximum. You would then have the stones going down to about an  $\frac{1}{8}$  inch in size. In my cement room I have drawers full of different sized material which I mix in making concretes.
10776. Would it be exactly fair to take one experiment, or even a dozen experiments, to arrive at even an approximate conclusion as to what concrete would make in position? It is very difficult indeed to say. You have to vary it. You should try the particular material at hand to see what it will do. You cannot say absolutely beforehand what it will do unless you have made an experiment with something very similar.
10777. The size of the stone from the crusher will vary every day, and therefore the bulking will vary? Yes, of course; the proportion of material which you call shivers, which would be with the stone, would vary.
10778. *His Honor.*] I suppose the machine would break into sand, as a general rule, any single small particle which did not retain its soundness as a single stone. Take small stones which have been nearly broken up, and which are ready to go to pieces easily; would those particles go into sand before the screening took place, or would they, as a rule, remain small pieces of stone on their own account? I do not think so; some of them would be smashed.
10779. If you prepared the stone for concrete by screening it through a  $\frac{1}{8}$ -inch screen, would the quantity which did not pass through the screen if the screening were properly done consist pretty universally, however small they might be, of sound pieces of stone? Yes, I think so.
10780. Not many pieces on the point of disintegration? No.
10781. You think the pieces on the point of disintegration would be disintegrated by the action of the screening? Yes.
10782. So it would come to this—that the concrete made of this material would be concrete consisting of bits of the original rock, the sand, and the cement, and its hardness would depend upon the hardness of the particles of the original rock, however small? Yes.

- W. H. Warren.  
3 Aug., 1896.
10783. The smallness of the particles would not weaken the strength of the whole result? No.
10784. The only effect would be that the body of stone would absorb less sand and less cement, or less compo., made of sand and cement? Yes; and, if you tested it, as I have done frequently, you would find that you often get better results with these smaller particles than without them. You get better results, because you get a more compact concrete.
10785. *Mr. Davis.*] As to the sand which is being used in Contract 77, you have been upon the ground, you say? Yes.
10786. Did you examine the sand which was being used? Yes; I took some away. As I have already explained, I went down to the works once, when there was no one there at all. I was at both White's Creek and Johnstone's Creek, and I took pieces of stone here and there in my endeavour to discover the nature of the material they were using. I have found it fairly good sand compared with some standard crushed stone sand at the University. I did not test it with cement, but I tried to find out the quantity of dirt in it, and I found that it came out just about the same as some good crushed sandstone of which I had samples.
10787. *Mr. Parkes.*] Is not concrete generally forked so as to get out the small material? I have seen it done, but as a rule an ordinary shovel is used.
10788. The general way of getting the gauge of concrete is to pass it through a  $\frac{3}{4}$ -inch sieve is it not? There are several sieves—a  $\frac{3}{4}$ -inch sieve would be rather a large sieve. The sieve used would depend upon the material with which you are dealing. It would depend upon whether you wanted to get anything into the concrete smaller than the mesh of the particular sieve.
10789. Cement is the strongest portion of the concrete is it not? It depends upon the adhesion of the cement to the sandstone or bluestone.
10790. But the cement and sand when combined are the strongest portion are they not? Up to a certain time they are; but sometimes you get pieces which break right through the mass of stone itself—that is to say the stone itself will break in two. More generally the cement pulls away from the stone.
10791. *His Honor.*] Which is the harder—ordinary Kiama basalt or compo.? Of course if you test basalt in that way the compo. will always pull away from the basalt. You will never break the stone in that case.
10792. The basalt is the harder material, both for tensile and crushing strength? Yes. I do not remember a case in which I have broken a piece of bluestone in a test.
10793. *Mr. Davis.*] Do you know the crushing strength of good Pymont sandstone? 5,000 lb. to the square inch.
10794. What is the crushing strength of compo, at say one month? 1,500 lb.
10795. So that the stone would be the stronger? If you take old concrete where the cement has had time to harden thoroughly—say concrete two years' old—and put it into the machine sometimes you get the stone broken in two, but it sometimes happens that you do not put the best Pymont stone into concrete. You may come across a piece which is not strong, and that, of course, will fracture across.

Joseph Davis recalled and further examined:—

- J. Davis.  
3 Aug., 1896.
10796. *Mr. Parkes.*] Will you read clauses 93 to 102, dealing with cement work, in the specification of Contract 79A? Yes.

*Concrete Works.*

93. The concrete to be used in foundations of sewer, and in arching and building round stoneware pipes, packing over brick arch in tunnels, where ordered, and in sumps, to be of sandstone concrete of the quality specified in clause 26. The concrete to be used for all other works in sewers, junctions, chambers, shafts, manholes, &c., unless where otherwise directed, to be bluestone concrete of the quality specified in clause 24.

94. The contractor to find, provide, and make at his own cost, all concrete boxes, centres, staging, shoring, planking, &c., of the exact forms, shapes, curves, &c., required, in a proper, secure, and substantial, manner, due allowance being made for  $\frac{5}{8}$  inch thick cement facing over all internal exposed surfaces of concrete work; and great care being taken that all centering and concrete boxes can easily be withdrawn, except where otherwise directed. The designs for centering, concrete boxes, &c., are to be approved by, and to the entire satisfaction of, the Engineer. After completion of any portion of the concrete or brickwork, the concrete boxes and the centering, as the case may be, shall not be removed until the Engineer or his Superintending Officer has given written permission to that effect.

95. The concrete, after it has been approved of, to be conveyed to the work as may be directed, and as shall be approved of, and tipped into same and upon the surface of each layer from a height not exceeding 18 inches. Commencing at each part of the work at lowest level of excavation, the concrete to be brought up in horizontal and even layers, and on lines of sewer, branch and pipe sewers, junctions, gas-check and shaft chambers, inspecting chambers, &c., unless where otherwise directed, in even layers parallel with specified longitudinal gradients of works; each layer, when spread, to be 9 inches thick throughout before ramming, and, after spreading, to be quickly and evenly rammed all over until approved of, and then allowed time to set before the succeeding layer is put on.

96. After the concrete has been carried up to the level of springing, all concrete arches to be commenced at both walls or abutments simultaneously, and carried on towards centre line in radiating parallel strips, spread 9 inches thick, of the whole width of arch, or in lengths as specified in clause 107, as shall be directed at the time, and rammed as before described, and, where the arch is thicker than 9 inches, the lower layer to be always completed throughout, 12 inches in advance of the upper succeeding layer, and then allowed time to set and harden before the succeeding layer is put on.

97. After completion of the brick closing-arch, all bluestone concrete work above springing of same, at sides of arch, in manhole chambers, gas-check chambers, shafts, &c., to be carried up in the same manner as specified in clause 95, and of exact dimensions, curves, and thicknesses, &c., as shown on drawings.

98. No portion of the concrete work described in the previous clauses (unless otherwise directed in writing) to be covered up with earth or brickwork until it has been examined and approved of by the Engineer. Any leakage that may appear in each layer to be carefully attended to and be made good and repaired at the time, as shall be approved, before each succeeding layer is put on.

99. All end faces of layers of concrete to be stepped back at each respective length of sewer or other work, as shall be directed: to be carefully washed clean with fresh water, and then to be grouted, prior to each layer of the adjoining length being commenced and joined on to the same.

100. After the lower layer has set to the satisfaction of the Engineer, its top surface to be carefully washed until approved, and then to be grouted all over, prior to each succeeding layer of concrete being put on.

101. In the event of any stoppage occurring to the work, from whatever cause, or in anticipation of rainfall, the contractor, before temporarily stopping work, shall finish it off at whatever level the work may be raised at the time, by thoroughly grouting the whole of the surface with cement grout.

102. In all cases where a layer at mid-day or at evening is left incomplete, the said layer shall not be continued after any stoppage until the surface of the lower and the end of the upper layer have been washed clean and then grouted with cement grout.

10797. This specification will be the same in all contracts? Not necessarily.

10798. It is the same in Contracts 79 and 79A? Yes.

10799.

J. Davis.

3 Aug., 1896.

10799. Taking the constructional clauses as to building layer by layer—is it not your custom first of all to put 9 inches upon the floor of the excavated tunnel from one shaft to another? No.
10800. Ought not that to be done according to the specification? I do not think so.
10801. Then what is the use of these details as to construction in the specification? There are qualifying clauses all through. They occur again and again. For instance, you will frequently see the words “unless where otherwise directed.” Not only so, but it is known in the Department that in works of this description the engineer must necessarily have certain discretionary power. The clauses are there to be put into operation supposing they apply and it is advisable to put them into operation.
10802. Are they not put into operation in the case of some contractors? I am not aware that one contractor is treated differently from another. The officers of the Department are instructed to administer the specification intelligently—in a fair and reasonable way.
10803. Do not you yourself insist upon having your concrete forked with a ten-pronged fork? No.
10804. Have you not given orders to contractors to do that? I have frequently said this—that I would not allow sand to go in with the stone. The specification does not admit of objection to anything beyond actual sand. As to my asking the contractors to fork, I have no power to do it. It has frequently happened that the contractor has asked permission to fork, and in some cases he has been allowed to do it. They had generally screened the portion of the metal containing the smaller particles, say up to three-quarters of an inch, the sand only being rejected.
10805. *His Honor.*] When you say that contractors have asked leave to fork, do you mean forking in substitution for screening? Yes; it has happened frequently. It is to save the contractors putting over the screen the whole of the metal. Say the forking has raised 90 per cent., and 10 per cent. has been left behind. This has been passed over the screen to eliminate the sand, and the small stuff which has been retained by the screen has been used in the concrete. In the case of 118, and also 77, where the sandstone was crushed on the ground, a revolving screen was used, so that there was no forking in that case.
10806. Where would the revolving screen be? At the mouth of the crusher. It would probably be a quarter-inch mesh.
10807. *Mr. Parkes.*] Would it not be a half-inch? No; but I should say that in a revolving screen, to get out the sand, you would have to have a larger mesh than an eighth-inch. The object of the screening is to eliminate the sand. If the sand goes in it weakens the concrete.
10808. In one clause of your specification you say that the stone is to pass through a ring of 2 inches;—is not the intention of that clause that that shall be the average size? No; the reading of that clause, since I have been in the Sewerage Department, has been that the largest size of the stone must not be more than 2 inches, and, to ascertain that, the words “2-inch ring” are used. It may be flakey—only a quarter of an inch thick—but it must not be, from angle to angle or end to end, more than 2 inches or  $1\frac{1}{2}$  inch, as the case may be.
10809. In building the invert to the sewer, before you put your centers in you put in some concrete? As I explained previously, the practice has been in the case of these tunnels to put in, at about every 5 feet probably, a couple of shovelful of concrete, heaped up together, so that you would have a surface on the top of the pat 6 x 6 or 6 x 9. Some of the pats are 4 x 4. These pats are allowed to set, and the centering then goes in. No concrete is put into the tunnel before the centering goes in, with that exception. The centering is built with the sewer. It is not a complete centre. The ribs are bolted to cross-pieces, and lagging is put on to the ribs. The centering is constructed as the sewer is constructed—that is, as the concrete goes into position.
10810. *His Honor.*] The lagging does not go in on the centering? As the concrete is brought up on each side the lagging goes into position.
10811. *Mr. Parkes.*] Why do you make a specification such as this;—why do you go into such detail if you do not intend to carry it out? We not only intend to carry it out, but we have carried it out.
10812. Supposing the contractor does a certain quantity, as you say—supposing the entire invert is carried on for 100 feet or 200 feet—and that he then stops and recommences the work the next day, he recommences with an upright joint? They do the sewer up to the springing as far as they can in one day. It may be 2 or 3 chains, according to the thickness of the concrete. Then they stop, and the work is stepped.
10813. But they have an upright joint? It is stepped in accordance with the specification, and then, before the work is recommenced on the next day, it is grouted.
10814. How much concrete work would they do in a day in an invert? I can tell you how much a gang of concretors will do, but how far the concrete will go depends upon the thickness of the concrete and the size of the sewer.
10815. How much would a gang do? They would probably put in from 12 to 15 cubic yards a day.
10816. But how many running feet? About a chain, I think. It would depend upon the size of the sewer.
10817. There would be a joint at about every chain then? Yes; the joints would vary with the size of the sewer, and a number of other things would have to be considered.
10818. In your concrete work you provide for all the centering and boxing, and everything of that sort, do you not? We provide for everything which is requisite to carry out the work.
10819. Supervision and everything? Yes; by inference.
10820. You put nothing in for contractor's profit? We do not put it in; and if the contractor does not put it in we do not object. We leave that to him.
10821. The bluestone concrete runs at about 50s. in the case of Contract 79A? Yes.
10822. That includes everything? Yes.
10823. In the case of Contract 79 the price is also 50s.? Yes.
10824. In the case of Contract No. 69 the bluestone concrete is put down at 43s., is it not? Yes.
10825. And the special bluestone concrete, including ironwork and everything, in the case of Contract No. 112 is put down at £2 15s.? I could not say at this moment; but as to Contracts 79A and 79, where the price of bluestone concrete is 50s., and Contract 69, where the price is 43s. the two works are different. There is a different size of sewer; it is considerably larger in the case of Contract 69. The work in that contract in connection with concrete would be less than in the case of 79A, and so the price is less.
10826. The price of 50s. is your own estimate? Yes.

- J. Davis. 10827. Take the cement at 12s.—that would leave 38s. for the metal and sand—how do you make up the total? You are assuming, first of all, what is scarcely the fact, and that is, that a cask of cement will only make a yard of concrete.
- 3 Aug., 1896. 10828. But you say so, do you not? I do not say anything about it.
10829. Your statement is that a cask of cement will make only a yard;—that is your own evidence? I have simply quoted from the authorities.
10830. That being so, it leaves 38s. for the sand and stone;—how do you make up that amount? I suppose you are assuming that it takes a cask of cement to make a cubic yard of bluestone concrete.
10831. I am taking a barrel of cement at 12s., and that leaves 38s. to be made up of the other material. I want to know how you make up the amount;—what, for instance, is the value of the 16 feet of metal? I should say it would cost from 11s. to 12s. a ton delivered on the works.
10832. What is the worth of the 16 feet? Well, the metal costs from 11s. to 12s. per ton.
10833. What is the worth of the 8 feet of sand? It would be worth, say, 7s. 6d. a yard.
10834. There would be a third of a yard of sand; therefore you are taking 38s. to represent sand and bluestone metal which would be worth about 15s.? I said that the stone would come to from 11s. to 12s. per ton.
10835. Would the 16 feet of metal take a ton? No.
10836. How do you make up the 38s.? You will have to add 12s. for the cement.
10837. I have already allowed for the cement. I suppose the labour would not cost 25s.? No; it would not be worth that.
10838. It would be worth 5s. according to Professor Warren, but it would be worth about 3s. as a matter of fact. I should like to know how you make up the balance? You have set me a task which amounts to justifying some one else. If you ask me to give you an estimate of the value of bluestone concrete I will do so.
10839. Do you not by your specification intend that the metal shall be broken to an average of 1½-inch gauge? Most decidedly not. I would never object to metal on account of its fineness as long as there is no sand or dirt in it.
10840. The cement is the most valuable material in the composition. It is worth four times as much as the other component parts and more. I would like to know how you make up your estimate? It is made up in the usual way. You get, approximately, at the material that will be used. You then estimate the amount of labour. Then there is the centering, plant, risk, profit, and supervision.
10841. But all these things will not make up the 38s.;—as a matter of fact, do you not always calculate in the Department that one and three-quarters of a cask of cement will go to each yard of concrete? I should say that if anyone had made an estimate of that description, it would be ridiculous. It would be much better for you to ask me what I estimate.
10842. What is the regulation estimate? There is no regulation.
10843. What do you estimate? My estimate would vary with the size of the stone.
10844. What do you estimate, according to your own gauge;—what is your own estimate, taking the bluestone concrete for instance? It would vary in relation to the position of the concrete.
10845. Take an ordinary yard? As I say, the estimate would vary with the position in which the concrete is put. Supposing you were putting in the concrete horizontally, then in all probability a cask would make more in measurement than if you were putting it in between the four boards of a pier.
10846. How much would it make if the concrete were put in horizontally? I should expect it to make probably 23 feet.
10847. How much would it make if the concrete were put in in the ordinary way in which it is put into the invert of a sewer—take sandstone concrete for example? I shall have to preface my answer with the explanation that it would depend, first of all, upon the size of the stone and then upon the position in which the concrete would be put in.
10848. But take your own specification? I have the sewerage specification in my mind. Take a mixing of sandstone concrete composed of 5, 2, and 1. The cask of cement, we will assume, to be 4½, the sand 8½, and the stone 21½. Those materials added together give 34½, that is before they are wet.
10849. You had not allowed for disappearance? I am coming to that. That concrete would make in some cases 27 feet, in others 28 feet, in others 29 feet, and in others over 30 feet.
10850. Would it vary like that? Yes.
10851. Is not that a sort of fancy work? No; it is what you might reasonably expect.
10852. Then what is the good of your having gauges or anything of that sort if you do not stick to them? We do stick to them.
10853. Will you read clause 107 of the specification to Contract 79? Yes; it is as follows:—
107. The concrete and brickwork of sewer in tunnel to be commenced, in accordance with clause 79, in the different lengths of tunnels, and to be carried on in each from each end simultaneously, in not less than three continuous lengths of 16 ft. 6 in. each—that is to say, when the arching of the first 16 ft. 6 in. commences the next 16 ft. 6 in. length must be in progress from height of invert up to the springing of arch, the third 16 ft. 6 in. length must be in progress between floor of tunnel and level of invert of sewer, and in the fourth 16 ft. 6 in. length the excavation and timbering of tunnel must at this time be completed and ready to receive concrete foundation of sewer.
10854. Is that ever carried out? It has been in some cases, but not frequently.
10855. With reference to the shrinkage of the concrete in Contract 101, why did you specify in that contract for an iron grid? There is in one of the general clauses provision made for bond rods.
10856. The same as Mr. M'Sweney is using in Contract 112? No; not like that work.
10857. His specification is identical, is it not? No; it is a different specification altogether.
10858. Does not this particular clause read in the same way? I do not think so. In the specification of Contract 112 there is detailed provision made for these bond rods, which is not made in connection with Contract 101.
10859. Why were not those clauses inserted in the case of No. 101? I cannot say at this moment, but if you will defer your question I will endeavour to answer it.
10860. I was going to ask you whether it was in your mind that it would have prevented the cement from cracking? I do not think it would. I have a strong opinion as to the cracks in that sewer, and indeed with reference to the cracks in concrete work as a whole. I do not think bond rods would have prevented the contraction. I think it might have broken the bond rods.
10861. You think that all concrete will shrink? I do.
- 10862.

10862. Do you think that the contraction of the concrete will break the bond rods in the case of the Monier contract? Provision is made in the Monier system for expansion and contraction. J. Davis.
10863. How is it made? In the case of the Monier system the elasticity of the arch is considerably more than would be the case with concrete. Aug., 1896.
10864. What about the carrier? And in the carrier also, seeing that it is so thin and is composed of 10 per cent. of iron or thereabouts, it would be much more elastic than an ordinary concrete structure.
10865. There must be a resistance in the iron to the shrinkage of the concrete? The iron and concrete will expand and contract in about the same ratio.
10866. How would the concrete come to fracture the iron—to tear it asunder? I suppose the iron would not be able to accommodate itself to the temperature. A tensile strain would be set up, and that would probably break small rods.
10867. What extra provision is made in the case of the Monier system for expansion and contraction? There are cross-cuts in the carrier over the piers of the arch.
10868. What are those cross-cuts? They are intended to provide for contraction and expansion. The theory is that when the structure contracts the crown of the arch will be slightly lower, and that when it expands it will rise again.
10869. Will not that open the aqueduct? It might have done so. The structure might not have been sufficiently elastic, but, in addition to the elasticity of the structure, provision is made in the cross-cuts of which I am speaking.
10870. But will the expansion and contraction not open the carrier? It could not possibly do that because of the cross-cuts of which I have spoken.
10871. With what are they filled? Mastic.
10872. Everything depends upon those mastic joints? For watertightness at those points.
10873. What would be the difference between the cost of an iron pipe run across instead of a concrete carrier? I could not say off-hand what the difference in cost would be, but I can tell you what was done before the structure was decided upon. An estimate was made for iron pipes at Mr. Hickson's request—that is, a single iron pipe. That was done some years ago when Mr. Bagge was in charge of the office, and it showed that iron pipes would be more costly than a brick and concrete structure.
10874. Very much more costly? Certainly more costly, but I could not say precisely what the difference in cost would be.
10875. Could you obtain that estimate? If it is to be found. I will certainly look for it, but the estimate was made some years ago.
10876. Was it shown that the iron pipes would be 10 per cent. more costly? I should say so, certainly.
10877. Would the difference be more than 10 per cent.? I could not say. If you made an estimate to-day the result might be different. Of course the price of iron would vary.
10878. Iron is cheap just now? Yes, it is low just now.
10879. An estimate could be made now I suppose applying to last year—that is, showing what it would have cost last year to take an iron pipe across these aqueducts. A comparison could be made between the cost of an iron pipe and the cost of the Monier carrier? Yes, certainly. I may mention that when the aqueduct at Johnstone's Creek and also at White's Creek was taken into consideration, Mr. Hickson had prepared a comparative estimate showing what the sewer would cost carried out with brick and concrete, and also with a pipe on piers, and the conclusion arrived at was that the brick and concrete work would be the cheaper. The original design was then made, but it was a little too costly for Mr. Hickson's ideas.
10880. *His Honor.*] That was the expensive design which was cut down to the departmental design for Contract 77, leaving out the top railings and several other things? Yes.
10881. *Mr. Parkes.*] Could you produce the estimate of which you have spoken? I will endeavour to find it.

William Thompson recalled and further examined:—

10882. *Mr. Parkes.*] You have made out with Mr. M'Credie an estimate of the quantity of cement which would be required in a given quantity of concrete as shown by some tests, have you not? Yes. W. Thompson.
10883. Will you describe to His Honor how you mixed the concrete? I think it is described pretty fully in our report. We first had the stone gauged to the right size. Then we washed it by placing it in a barrow half full of water, and it was roughly washed. We then took it from the barrow, and forked it out on to the platform. It was then put into the gauge box to get the right proportions. We used a 4-ft. gauge box to determine the proportions of stone, sand, and cement, and laid one upon the top of the other as specified. The materials were then thoroughly mixed and put in a gauge box of one yard capacity. Aug., 1896.
10884. Why did you fork it? For the convenience of handling it.
10885. Do you know if forking is the method generally adopted under Government inspectors? Yes.
10886. How do you know that? From my experience. I know that forking is the usual method of handling ballast. We lost nothing to speak of by the forking, in putting the stone from the barrow into the gauge box.
10887. Was there not any residue? Very little, except dirt and rubbish.
10888. How many prongs were there in the fork? I think six, but I could not be sure upon that point.
10889. Did you ever hear of concrete being made out of material which was screened over a  $\frac{3}{4}$ -inch screen? I think in this case 2-inch stone was specified, and I take that to mean that the stone is to be as near to 2 inches as you can get it.
10890. That is the object of the specification as to gauge? Yes; I think so.
10891. If you had put in all the residue—that is, all the small stone—you would have greatly increased the bulk of the concrete? Not greatly; there was a great deal of inch stone put in. It was not by any means all 2-inch. It would range from an inch upwards.
10892. Suppose there were a specification signed for concrete of 3, 2, and 1, you would not expect to find the metal of all sizes up to a certain gauge to the exclusion of cement? In mixing those proportions if you took three boxes of ballast you would have to take one box of cement.
10893. Therefore in the gauge box there could be no escape as regards the quantity of cement? No; not in the gauging.
10894. Supposing the small stones were put in they would only crowd out of the gauge box, to a certain extent, other stones;—supposing the stone were a  $\frac{1}{2}$ -inch instead of an inch there would be a greater number

W.  
Thompson.  
3 Aug., 1896.

- number of interstices to fill up, would there not? The smaller stone would help to fill the interstices. Our three-quarter stone ran from an eighth-inch to three-quarters, but it only increased the bulk one eighteenth.
10895. Unless the stone were of a very flat or flaggy nature there would not be a great deal of difference in the consumption of cement? Not a great deal.
10896. You feel certain, from your own experience, as to the nature of the concrete the Government had been in the habit of putting in, that your tests are reliable? Yes; so far as the tests are concerned, we followed the specification literally.
10897. Did you make any inquiries as to the way the Government have carried out their concrete work? No; not in the sewerage works. We simply followed the specification.
10898. Did you not receive any information upon that point? Mr. M'Credie may have done so, but I am not aware of it.
10899. Have you much knowledge of sewerage construction? No.
10900. Is there any other subject upon which you are in a position to make a report? Yes; we have dealt with the question of grouting.
10901. In what way is the grouting specified? Each layer of concrete is supposed to dry, and it is then washed and grouted.
10902. How many layers did you calculate? Layers of 9 inches.
10903. How many layers did you calculate? It would depend upon the depth of concrete. We took it as a 9-inch. We got a bed 9 inches thick in the yard box and then grouted it.
10904. If the concrete were not carried out in layers, as provided by the specification, and were stepped at every chain, and had then to be re-started, it would consume a lot of cement, would it not? Yes.
10905. *Mr. Davis.*] The stone that you used for your experiments was knapped stone? Yes.
10906. The knapping would produce more cubical stone than a machine, would it not? I dare say it would.
10907. You say you used a six-pronged fork? I cannot swear as to that.
10908. What space would there be between the prongs? I dare say from three quarters of an inch to an inch. It certainly would not be more than an inch.
10909. You say you adhered rigidly to the specification? Yes, to the very letter of it.
10910. Did you find in the specification anything about the stone being forked? A fork is used by the contractors for handling stone.
10911. But did you find anything about a fork in the specification? I do not think the specification mentions forking.
10912. Yet you say you kept rigidly to the specification? We used the fork for convenience sake.
10913. Where it was convenient to depart from the specification you did so? Yes; but we had no ulterior motive.
10914. When you found you could get through your work more quickly, you departed from the specification? It is the custom to use a fork when you are mixing ballast. If you use a shovel you pick up a lot of dirt and filth.
10915. Do you know what the specification says as to the elimination of dust and sand from the stone which is used for concrete—is a fork mentioned? I have not seen it.
10916. What does the specification say? It mentions screening, I think.
10917. Will you say why you did not screen the metal rather than fork it? There was no particular reason. Forking is a convenient method of handling the ballast; that is all.
10918. You have spoken a good deal of your experience of concrete work;—will you tell His Honor what experience you have had in putting concrete in position? I have supervised the erection of several houses, but I have not said much about experience.
10919. In concrete? Only the footings; there has been the usual run of footings.
10920. Beyond that have you had any experience? No.
10921. Would you like to pit your experience, gained from work of that description, against the experience of others who have carried out thousands of yards of concrete? I have no great experience of that kind, but I know that these tests were made.
10922. I am speaking about your experience;—would you like to pit your experience against the experience of those who have carried out thousands of yards of concrete in work similar to that under consideration? Not in the matter of experience.
10923. Would it not be more likely that they would know what concrete would probably make in work under certain conditions than you would know? In the matter of experience I dare say it would be so.
10924. As to the grouting, how did you arrive at the conclusions mentioned in your report? We took a third of a foot of cement and two-thirds of sand and mixed it into a liquid.
10925. That would make how much? A foot.
10926. A cubic foot? Yes.
10927. What quantity of water did you put to those quantities? Enough to make it liquid.
10928. Do you know how much? I think a big bucket.
10929. Another cubic foot of water, do you think? More than that, perhaps.
10930. A foot and a half? I should think so, though I am by no means sure on this point.
10931. Then you would have 2½ feet;—what did you do with that 2½ feet of grouting? We used one of the ordinary zinc buckets; but it would not contain 2½ feet. We mixed the material into a liquid, and then placed it over the concrete, brushing it into any interstices or depressions.
10932. On to what did you put this grouting? On to 4 yards of surface.
10933. Four square yards of surface? Yes; the box was 4 ft. x 4 ft. 6 in. There were two of those boxes, making 4 yards altogether.
10934. And you say you put 2½ cubic feet of grouting on to 4 square yards? Yes.
10935. What was the thickness of the grouting when it was put on to the 4 square yards of concrete? The grouting we put on would not go more than the eighth of an inch. It would be a little thicker in some parts than in others though.
10936. Supposing the concrete work had not been grouted, as you seem to have assumed it was every 9 inches, do you think it would be a fair thing to charge against the contract the quantity of cement which should be used according to your estimate? Of course, if it were not used it would not be there; but the work was specified to be grouted.
10937. How much did you reckon for a cask of cement? We ran it out into a 4-foot box.
10938. And that was the quantity you reckoned? Yes.

10939. From your experience in the use of cement, what would you say that a cask of cement would measure, taking one cask with another? Some of the English cement will run  $4\frac{1}{2}$  feet when loose. Goodlet and Smith's rock cement just filled a 4-foot box.

10940. That cement has not been made very long? A few years, I think. I do not know when the works were started.

10941. Would you be surprised to learn that the works had not been erected more than eighteen months? I do not know the exact period, but I do not think they have been in existence more than a couple of years.

10942. In the second paragraph of your joint report, you refer to the departmental estimates;—to what estimates do you refer? To the estimates on page 339 of the Parliamentary return. We took that more as a comparison between the cost of guttering and gadding and blasting, as estimated by the Department.

10943. Supposing it to be the fact that the estimate you quoted refers to Contract 79A, and not to Contract 79, then what you say right through your report would scarcely be applicable;—you would not suppose that the Government would use the same figures in every contract? No, probably not.

10944. This estimate, as you see, refers to Contract 79A, and not to Contract 79? Yes. We only adopted it to make the comparison to which I have referred.

10945. Then you would say that it would not apply? Not beyond that comparison.

10946. But your comparison would not be a fair one? Yes; in that respect it would. We took the Government estimate for blasting and their estimate for guttering and gadding. We took 17s. as the difference between the two.

10947. *His Honor.*] If both prices were ratably higher the difference would be greater; if they were ratably lower the difference would be smaller? Yes.

10948. *Mr. Carter.*] Do you consider that irregular-sized stone will make the best concrete? Yes; I dare say it would make better concrete—at any rate in the bluestone.

10949. *His Honor.*] Irregular sized stone? Yes; but when we saw that 2 inches was specified, we assumed that the stone was to be as near 2 inches as we could get it.

10950. But as regards the strength of the concrete it would improve it to put in various sizes of stone under the maximum? Yes; I should think so.

WEDNESDAY, 5 AUGUST, 1896.

Joseph Davis recalled and further examined.

10951. *Mr. Parkes.*] Will you read the supplementary specification of Contract 77, which appears upon page 247 of the Parliamentary return? Yes. It is as follows:—

The structure above the level of the skewbacks of main arches to be constructed, as shown on drawing which accompanies the contractor's tender, of cement mortar (except the cement facing) composed of one part of cement to three parts of sand and wrought-iron rods on the "Monier system."

The foundations of piers are to be in conformity with the drawings attached to the contract, except as regards the extra size necessitated by the larger pier shown on the contractor's plan, and are to be to the satisfaction of the Engineer.

Should the piers be required to be put down to a greater depth than shown on the drawings, or a greater number of them require piling than shown, the work is to be executed as ordered without extra payment being made.

The piers are to be built with sandstone concrete of the quality specified, and faced with cement mortar composed of one part of cement and two parts of sand.

The cement facing of the structure, above the level of the springing of main arches, is to be composed of one part of cement and one part of sand.

The works generally are to be carried out in accordance with the specification, schedule to specification, and the plans therein referred to, save and except such structural parts as are to be carried out under the "Monier system," or necessarily enlarged to meet the requirements of the contractor's plan, and within the time set out in the general conditions.

10952. How is it that your vouchers show payments for two to one mortar? None of that work was done, I think, so it is not paid for.

10953. There is no specification for the five, three, and two, special bluestone concrete? No; not attached to the contract.

10954. It was optional to substitute it for the compo.? When the portion of the carrier nearest the Glebe was about to be commenced the contractors put in two lengths of the carrier, one composed of three to one compo. and the other of five of bluestone, three of sand, and two of cement. Two lengths of the same carrier were put in in that way. They were tested by Mr. Darley, and he came to the conclusion that the bluestone was the better construction, the more stable structure, and he decided, as the contractors were willing to substitute the bluestone concrete, to allow that to be done.

10955. They substituted it at the price of the compo.? They did so, although it cost more.

10956. Still, that is their agreement with you? Yes; it is all covered by the lump sum of £15,500.

10957. Therefore in the valuation it ought to be taken as compo.? It is a lump sum tender. Professor Warren in his estimate took into consideration the fact that the contractors were using this composition of five, three, and two, in the carrier.

10958. Will you continue reading the specification? Yes.

The contractors shall continue to maintain the said works at their own cost after the period of maintenance set forth in the general conditions, for a further period of three years computed from such date, to the satisfaction of the Engineer, whose decision shall be final and conclusive upon all points concerning workmanship and materials, and the permanency and durability of the said works: and the contractor shall enter into a bond to Her Majesty the Queen in the penal sum of £12,000, and find two sufficient sureties to enter into separate bonds in the penal sum of £6,000 each, to secure the removal of so much of the said works as shall have been constructed on the "Monier system," if the Engineer shall be dissatisfied with the same at any time during the said periods of maintenance, and to re-erect and construct the said works at their own cost and expense in accordance in all things with the specification, schedule to specification, and plans therein referred to, within thirty-nine weeks from the date of being called upon so to do.

10959. Those sureties were supposed under that undertaking to be men independent of the contractors? They were supposed to be men who were independent of the contract.

10960. But independent of the contractors? I would not say that they were, because, as a matter of fact, it is generally known in the office that these men have for years been mixed up together in one way or another. Some part of the firm would be tendering at one time and some part at another time.

10961. But would you take as sureties men who were interested in the firm? Mr. Gillan and Mr. Forrest were taken in this instance, but I would not say that they were interested in this contract. It was not known that they were interested in this contract.

10962.

W.  
Thompson.  
3 Aug., 1896.

J. Davis.  
5 Aug., 1896.

- J. Davis.  
5 Aug., 1896.
10962. Does not the specification you have read state that the sureties should be independent of the contractors—that they should not be allied with the contractors? It says that two sufficient sureties are to enter into separate bonds in the penal sum of £6,000. It all depends upon what is the meaning of the word “sufficient.” The Department judged that Mr. Gillan and Mr. Forrest were “sufficient” sureties.
10963. Has it not been the general practice of the Government in taking sureties to insist upon their being persons with fixed securities? The Department has taken every care to ascertain that the personal sureties they have taken have been men reputed to be worth powder and shot. [*Vide Appendix No. 9.*]
10964. Is it not the general practice to take men of fixed property? I would not say that. I would say that they should be men at any rate worth as much as, or more than, the amount of the bond they enter into.
10965. Would you not read the undertaking to mean, so far as Mr. Carter is concerned, that if the Government would take the patent they would give a disinterested guarantee to remove the work in three years if it were not suitable;—that the contractors undertook to enter into a penal bond of £12,000 and to provide two sufficient bondsmen of £6,000 each to replace the structure if any defects were discovered, or if it were found not to be stable? Really the Government have a guarantee of £24,000—£12,000 as far as Carter, Gummow, and Snodgrass are concerned, and if they failed there would be £12,000 in respect of Mr. Gillan and Mr. Forrest.
10966. Really the Department would only have £12,000 guaranteed if Carter & Co. failed? I did not put it in that way. I said they had a guarantee of £12,000 as far as Messrs. Carter, Gummow, and Snodgrass, were concerned, and another £12,000 in respect of Mr. Gillan and Mr. Forrest.
10967. You mean that they had a promise of that amount—they had no cash bond? No cash security.
10968. But when you take bondsmen’s names you want to know whether they have some cash on which you can lay your hands, or the equivalent of cash in property? As far as Messrs. Carter, Gummow, and Snodgrass, were concerned, we had a fixed deposit; as far as Messrs. Forrest and Gillan were concerned, we had a statutory declaration that they were worth the amount named.
10969. The concrete which was specified to be used in the original structure round the carrier would be seven, three, and two? Yes.
10970. In making up a schedule, the contractors generally take off a certain percentage from each item in the schedule, and see what they can make out in a lump sum? I cannot say what they do. One contractor would do one thing and another contractor another.
10971. But all the items of the schedule compiled by the Department would not bear a uniform relation? They should do so. At the same time, the officers of the Department are not perfect, and the prices given might not bear the same relation to each other. At any rate, there might be room for difference of opinion. The contractors might consider that they were not in proportion.
10972. What is the price of Bautel’s and Bakewell’s best double-pressed bricks? It depends upon the place to which they have to be delivered; but, taking one contract with another, I suppose they would be worth from 60s. to 70s. a thousand. They used to be worth 90s. or even more than that a thousand.
10973. Are they not worth about 80s. a thousand? They used to be, but I do not think that is the price now. The last time I inquired they were 70s., but whether they have gone up lately or not I do not know.
10974. How long ago would it be since you inquired? Some months. I believe that the man who was instrumental in bringing down the price has given up making bricks, and possibly the other makers may have taken advantage of that.
10975. The average price would be, say, 70s.? I should say something like that; but it would depend upon the distance at which the bricks had to be delivered. I may mention that in the case of the Marrickville contract the brickyard was on the ground. There was really no delivery.
10976. Coming now to the matter of stone—what is the price of the best dressed stone per foot? The rough Pymont bottom-block stone would be worth about 27s. a cubic yard delivered. Then there is the dressing, and it stands to reason that the price for dressing would depend upon the amount of work upon the stone.
10977. But what is approximately the market price per cubic foot? I should say it would be about 3s. if there were an ordinary amount of dressing on the stone. It is generally dressed at the works.
10978. But what is the price of the stone at the quarry? The best bottom-block would be about 1s. a foot.
10979. The very best? Yes.
10980. Are you not making a mistake there? I do not think so.
10981. Suppose you were going to erect a large building, could you get the best bottom block stone at 1s. a foot? I should say that that would be a fair price.
10982. Do you know the price? I do.
10983. Whose figures are you quoting? I am quoting from my own experience—from my own knowledge of Sydney sandstone.
10984. Are you referring to the best Pymont stone? The stone I speak of would be equal to the Pymont stone. It is obtained at Waverley.
10985. But what about the Pymont stone? It is possible that Mr. Saunders has a higher estimate in connection with his own quarry. He might possibly try to get a little more for the stone.
10986. You put the labour and stonework, associated, at 3s. 6d. a foot run;—is that a fair price? I should say that it was a little high. The Department, in the general conditions, provide that the ashlar work is to be measured from outside edge to outside edge, that is, the stone that is cut away is paid for. The contractor in fixing the rate would take that into consideration, I should imagine. If this stone were paid for nett measurement after it had been chiselled it would be put at a higher price.
10987. But the contractors pay for it at the quarry in bulk? Yes.
10988. *Mr. Norrie.*] At the time the supplementary specification was drawn, do you know whether it was anticipated that Mr. Gillan and Mr. Forrest would be the sureties named by Carter, Gummow, & Co.? No.
10989. Was it known that they might name these two gentlemen? No; the specification was drawn quite independently of them. As far as my recollection serves me, and I think the papers show it, the question of personal sureties came up afterwards. When the supplementary specification had been drawn, Messrs. Carter, Gummow, & Co. wrote.
10990. *Mr. Parkes.*] But the supplementary specification was drawn by the contractors? No; by myself in conjunction with Mr. Norrie. [*Vide Appendix No. 1.*]
10991. But it was sent in by the contractors? No; it was drawn by myself in conjunction with Mr. Norrie, altogether independently of the contractors. I drafted the specification with my own hand.

10992. And the other specification was incorporated in it? It was incorporated in the bond.
10993. But with the original specification? The draft specification is given on page 207. Messrs. Carter, Gummow, & Co., wrote upon 4th April, after it had been drawn, objecting to stringent clauses. What they submitted was their tender with the plan which is before the Commission and that only. When their lump sum tender was accepted the question of the supplementary specification arose and I drafted it myself in conjunction with Mr. Norrie.
10994. But the letter of Carter, Gummow, & Co. is not a protest against the specification. It is only a suggestion that the Department should dispense with the bondsmen? It is a protest against that part of the supplementary specification dealing with the question of bondsmen. [*Vide Appendix No. 9.*]
10995. It is hardly a protest. It is asking you to do what you did ultimately? No; and I can only repeat what I have already said. We knew absolutely nothing to guide us in coming to the conclusion that Mr. Gillan and Mr. Forrest were members of the firm for this contract. On the contrary if we turned to the tender we found that the gentlemen composing the firm were Mr. Carter, Mr. Gummow, and Mr. Snodgrass, so far as that particular job was concerned.
10996. Had Mr. Gillan and Mr. Forrest ever done work for you themselves outside of Mr. Gummow or Mr. Carter? Certainly; both of them—both Mr. Gillan and Mr. Forrest. [*Vide Appendix No. 25.*]
10997. On what occasions? Mr. Forrest in conjunction with Mr. Snodgrass; Mr. Gillan in conjunction with Mr. Snodgrass; and Mr. Gillan in conjunction with Mr. Gummow.
10998. But they had been associated with Mr. Gummow? They were mixed up for years in some way, which I do not profess to understand.
10999. Knowing that, would it not have been well to inquire whether Mr. Gillan and Mr. Forrest were members of the firm? It was no part of my province. I do not see how I could answer the question.
11000. *Mr. Norrie.*] You would not think the Department would be justified in refusing to accept as a surety a person known to be worth a large sum of money in bank or other stock because he had not real estate? I should say not. In the case before us, every means seems to have been taken to satisfy the officer responsible that these men were stable men, and were worth the amount of the personal surety into which they entered with the Government.
11001. Would you like to enter into a bond of that kind without having a *quid pro quo*? I should say not.
11002. *Mr. Carter.*] The guarantee of £12,000 of Messrs. Carter, Gummow, & Co. would be sufficient to cover the whole cost of the superstructure, independently of the sureties, if it had had to be removed? More than sufficient. The superstructure, according to the estimate of Professor Warren, would cost about £7,500. We had a personal guarantee for £12,000 in addition to the fixed deposit of £775.

J. Davis.

5 Aug., 1896.

William Henry Warren recalled and further examined:—

11003. *His Honor.*] I notice that the price of timber is given in your estimate as follows:—732 cubic feet at 2s. 6d. per cubic foot, and 7,513 superficial feet at 13s. per hundred. I have been unable to reconcile these two prices? I have taken 13s. per hundred superficial feet because I thought it a fair thing, and so far as the cubic feet are concerned, I think 2s. 6d. is a fair price for good timber.
11004. But how is it that the cubic foot measurement comes out at nearly double the superficial measurement, not only in your estimate but in the specification;—why should timber, measured in one way, be so different in price from timber, in which there is more work, measured in another way? I think that you will find that Goodlet and Smith's price-list shows the same thing. I have often had to order timber from them. It is possible that I may have paid a little more than would be paid by the contractors, but I think I have given the prices in Goodlet and Smith's list.
11005. But can you explain how it is that the prices run so differently? Well, you could use the superficial feet over again. It does not look to me like new timber, although I dare say it was new when it was first put in. I cannot explain why there should be the difference you mention. I do not know that I ever thought of it before. I have simply taken the facts.
11006. *Mr. Parkes.*] You know that the trade never sell small scantling, such as 6 x 4½, 12 x 4½ or 8 x 4½, by the cubic foot? Perhaps not, but I have always been accustomed to estimate cubic feet of timber. All bridge work is done in that way. I remember the prices better, taken by the cubic foot.
11007. But if you take the cube out, ought you not to base the price on the superficial value;—why do you add on 100 per cent.? It is possible that I may have taken the timber too low at 13s. per hundred.
11008. But ought not the value given to be the price at which the trade sell the timber? If I have given any price which is not in accordance with market rates it is wrong, of course.
11009. Did you measure up the scantling yourself? I did not measure it all. I measured one span, and I assumed that the others would be the same.
11010. Did you not notice that in the main principle you got one piece of timber, 12 x 6, made up of fitches bolted together? But it comes out at the same cubic measurement.
11011. But you have taken it at 2s. 6d. per cubic foot;—why did you not take it at the superficial measurement, seeing that it was bought at that measurement? It is my way of taking such measurements. Bridge braces are measured in the same way. I measured the timber in just the same way that I should measure bridge trusses. I saw that there were two or three pieces together, but I took them in one item.
11012. Where did you get the price of 2s. 6d. per foot? I knew that the timber would be worth about that.
11013. But it is not worth that;—the price is more than 100 per cent. in excess? Of course if Goodlet and Smith's list shows a reduced price, I must accept it.
11014. I am taking trade prices—the prices of all the merchants;—as a matter of fact, I believe Mr. Carter bought his timber from Guy, and Guy's price is 9s. 6d., not 13s. per 100 superficial feet? I was not aware of that. [*Vide Appendix No. 41.*]
11015. There are various kinds of timber used, 12 x 4½, 6 x 4½, 4 x 4½, but you have put it all down at 12 x 6? It works out at the same cubical contents. I measured one span, and I took them all to be alike.
11016. If they are irregular, your calculations would be thrown out? I felt that it was extra work for me to measure the trestles at all, and I thought that if I took a measurement in order to get at the price of one trestle, it would be sufficient.
11017. *His Honor.*] Which one, as a matter of fact, did you measure? I measured the second from this end, the one over the stream.

W. H. Warren.

5 Aug., 1896.

11018.

- W. H. Warren.  
5 Aug., 1896.
11018. *Mr. Parkes.*] Did you work out the average of what you call the lagging on the top of these principles? Yes.
11019. How did you arrive at the 9 feet of width? It is 9 feet.
11020. But it is irregular—the timber runs all sorts of length? That which I measured was 9 feet.
11021. But the timber is irregular—there are ends sticking out? A little; but it is about 9 feet.
11022. How did you get the average? I simply looked along the work. I measured the projections; that is how I got it.
11023. Supposing the average accurately taken were found to be 8 feet, that would alter your calculations? It would alter it to the extent of one-ninth on that item.
11024. Here is a mistake you have made against yourself; the side boxing is 83 feet; you will find there is an average of 2 feet by  $1\frac{1}{2}$  inch; that will make your calculation a little greater;—but, as regards the fitches, of course they should be measured by the superficial area, instead of the cube? I would not press anything like that, of course. I did not take out the quantities as if I were going to build; I simply wished to arrive at a price. I did not measure up the timber in the way in which I should have done if I had been ordering timber. I simply wanted to get an idea of the quantity of timber and the price.
11025. The six ribs you have given in your estimate should be twelve, should they not? Yes.
11026. And the next item should be six ribs of lagging to each small arch? Yes.
11027. You have 500 superficial feet in that item? Yes.
11028. But there would be really 750 superficial feet, so that there would be a little extra? I am prepared to accept any correction, so far as those details are concerned.
11029. The boxing of the small piers, if you measure it according to dimensions and take it superficially, would be 495 feet instead of 750 feet;—I suppose you will accept that correction? I took the measurement from the size of the piers which are already there. I had not seen the boxing. I had to take what I thought to be a sufficient quantity of timber for the construction.
11030. Did you take the measurement off the plan as well as off the actual timber? I did the best I could between the two.
11031. As to the item of timbering the sides of the main carrier, did you take a very accurate measurement of that? It is on a par with all the timber measurement.
11032. I think you will find there is a little error there, and that it is 170 feet too much? When I measured the timber there was no work going on there at all, and I had to fill in the quantity which I thought would be necessary to carry out the work.
11033. *His Honor.*] You got on to the top of the arch, I suppose? Yes.
11034. *Mr. Parkes.*] How did you arrive at the 30 superficial feet per foot run in what might be called the invert mould—in what you call the lagging;—could you tell me whether, as a matter of fact, it is not 15 feet? I have not the details with me now, but I will accept it at 15 feet if you say that that is so. I have taken it as 2 inches thick.
11035. As a matter of fact, it is only  $1\frac{1}{2}$  inch thick;—did you know that? No; I took it at 2 inches.
11036. Did you measure it with a rule? No; the timber was not there, but I knew, of course, that it was necessary.
11037. If it is  $1\frac{1}{2}$  inch thick, instead of 2 inches thick, that would make a considerable difference in your measurement? It would be a quarter off.
11038. As to the scaffolding, you have taken all the scaffolding;—how did you get at that—did you measure it all? I think I may have underdone the scaffolding; it was not all there at the time when I took the measurements. I saw afterwards certain planks which I had omitted.
11039. Only 75 per cent. of the scaffolding goes to the principal part;—now as to the scaffolding for the piers? I took the scaffolding I saw, and I added what I thought necessary. I assumed that it had nothing to do with the piers. The scaffolding necessary to put the concrete in the piers was estimated at £1 8s. That is one reason why I did not knock off anything from the £1 8s. when I took my own prices.
11040. Are you sure that 260 cubic feet of scaffolding would go to the Monier part of the work? Yes; I measured it and worked it out. Of course, I did not measure the timber as though I was going to order it.
11041. You enlarged the quantity, did you not? I do not think so.
11042. What is the size of the scaffolding? There are two uprights with the horizontals and bracings.
11043. What were the dimensions of the timber? I do not remember.
11044. Have you any record of the dimensions? Not with me.
11045. Do you think 8 x 8 and 8 x 4 would be about the dimensions? I think I have 12 one way in my dimensions, but I am not sure.
11046. If the timber were 8 x 8 and 8 x 4, there would be an error in your calculation? I have not my details with me now, and I cannot be certain whether I took the timber at 8 x 8 or not.
11047. If it were so, there would be an error in your calculation? I cannot tell; I have not worked it out. Scaffolding is a small item, and I did not bother very much about it.
11048. Supposing you took the trade prices of the day and ran the quantity out, not as you have done, by the cube, but by the superficial foot, and supposing all your figures were correct, your cubic measurement and superficial measurement put together would make 163 squares? Possibly.
11049. Will you accept that measurement; I have worked it out very carefully? I have no doubt it is right.
11050. Where did you get your price of 13s. per hundred superficial feet? I assumed that the price would be about 13s.
11051. You did not take it from a trade list? No. I have often ordered timber, but I order it generally by the cubic foot.
11052. Have you not charged too much for the small scantlings? I have ordered 8 x 8, 12 x 12, and 10 x 10 hardwood and Oregon timber. The price I have allowed is founded upon the price I generally pay.
11053. It must have been a very small portion of timber? I should not order large quantities for my ordinary testing.
11054. Take the price at your own—13s.—the cost of the timber in four sets of arches would be considerably reduced? I should be surprised to find that it was. Of course, I may have overmeasured it.
11055. I mean taking the timber by the superficial foot, instead of the cube foot? Of course, because the price per cube foot is dearer than the price per superficial measurement.

W. H.  
Warren.  
5 Aug., 1896.

11056. *Mr. Davis.*] In your estimate of 2s. 6d. what have you included—where have you got the iron-work used in the construction of the centres? I have taken it all in in the price I have given. I took a sketch of the bolts, and I took the pitch of them, and they, of course, are included.

11057. In fixing the price at 2s. 6d., did you not take that into consideration? I did.

11058. Is it not invariably the case in measuring centerings, or rough bridge work, to take the cubic contents of the work as it stands, including the ironwork? Undoubtedly. As I said before, I measured the work as I should measure bridge work, where we do not go in for superficial measurement as would be done in the case of architecture.

11059. *Mr. Parkes.*] Coming to the labour in the girders, you have multiplied each into your sum total as if a new set of timber were required for every arch? I took the cost of labour for the completion of one arch.

11060. But you have forgotten that the same set of material would be shifted from arch to arch? It can be removed from one arch to another, certainly.

11061. That would be merely the labour of removal, but you have estimated the labour of fixing the centering, and putting it together in connection with each arch;—that, surely, is an error? I have taken it in this calculation as if the centering had to be erected for each span.

11062. As if it were pulled down and had to be erected again? Yes.

11063. So that if that did not happen there would be an error in your calculation? Yes, to that extent.

11064. *His Honor.*] Did you take each item distinctly—that is, the complete making of a centre, the laying of it out, the measuring, and everything? No; I merely allowed for the building of it together. The labour for making and fixing the centres is distributed over the arches, but after the centres are once made I can see that they could be removed without so much being taken down as I have assumed to be necessary.

11065. *Mr. Parkes.*] The same thing would apply to the boxing, the invert boxing, and also the centres for the small arches; once they have been made they can be shifted from one position to another? There is really nothing in the centering for the small arches; that would not make any difference; my price would come out right for that.

11066. They did not put in new centres for every one of the little arches, did they? I do not think I have taken the centres per arch.

11067. You have multiplied them, and have put them into your addition;—the labour you put in is for the entire work is it not? Yes.

11068. Very well, then, you have multiplied that into the arches; that is evidently an error? I do not quite see that it is so.

11069. You have given the total of labour for each arch, and you have made a sum total for the arches? Yes.

11070. You have taken the seventeen arches, and have multiplied them by your entire labour, therefore you have included in it all the labour that was used in making the centerings, as well as the labour used in removing them; you have put down £7 for the removal of the timber, and you have even included that? Yes.

11071. As a matter of fact, all the labour in the centerings, with the exception of four, should have been eliminated; the only other items left in would be the removal and re-erection of the centerings? There would be a good deal in connection with re-erection.

11072. You have put down an amount for removal and re-erection, and it would have been all right to multiply that by seventeen, but as regards the labour used in the construction of the centerings, you should have multiplied by only four; you see that an accidental error has crept in there? Yes, apparently.

11073. You have allowed an item of £150 for cost of plant, consisting of two sheds, one office, tools, barrows, &c.; do not the sheds and also the tools and barrows remain the property of the contractors? I should like to say a word or two about that matter. I am not an expert in the valuation of property. His Honor would probably value it better than I could do. The thing stands as I have it in my estimate, and, of course, it is of no use to press it if you object to the valuation. The sheds and office on the ground can be valued by someone who is accustomed to value those things. If I were buying them, I should certainly get some one to value them for me.

11074. When the contract is finished the contractors remove the sheds, the barrows, and the tools? I had better make this explanation. I assumed that the contractors would not estimate, in making up their contract, what they would be able to do with these things afterwards. They might not have an opportunity to bring them in again. This might be their last contract.

11075. There is also an item of £25 for 2,000 feet of water-pipe at 3d.; when the contract is completed that still remains the property of the contractors? Yes; but it will have to be taken to pieces and carted about, and the probability is that it would not be of very much use.

11076. But the contractors would dispose of this material if they did not shift it; ought there not to be some contra allowed for the price they would receive for it? I thought I put the price sufficiently low to allow for that.

11077. Then take the matter of supervision—you have allowed 5 per cent., or £375? Yes; the 5 per cent. was just a guide.

11078. You are putting it in the total of £1,176 12s. apparently, but you had previously included it in the price of the compo.? That makes a very slight difference; this is only a rough estimate, of course. I had hardly any other way open to me of making the estimate unless I spent a good deal of time upon it. It is only approximate.

11079. Have you not by these various means built up in rather an extravagant way the cost of this Monier construction? My estimate may vary from your estimate. It may appear high, but, of course, I cannot help that. I have not intentionally made it high.

11080. Although your supervision is put down at 5 per cent., it really goes into the contractors' profit? If you subtract it from the other items there you will find that it comes out at about 5 per cent.

11081. But supervision is put down in the price of labour at 10s.? That is a foreman's wages. You cannot call that supervision. It is not the supervision such as the contractors would have to pay for. The supervision I refer to would be that of the contractors' engineer, or that of the contractor himself. I suppose he would expect to be paid some salary.

11082. But you have also given them profit and risk? That is not included in his actual professional labour.

11083.

W. H.  
Warren.

5 Aug., 1896.

11083. Where did you get your item of wages, 7s. 6d., and in one case 10s.? I know that I always had to pay 7s. 6d. for a man. This is not such easy straightforward work that you could expect to get it done much cheaper.
11084. Suppose the contractors' pay-sheets show that they have been paying 7s. and 6s., and that they have had a foreman at 8s., that would reduce your calculation? Of course the pay-sheets would be a better guide to the cost of labour than would my estimate. I had not the advantage of the pay-sheets when I was making my calculation.
11085. That would lower your estimate? It would lower it to that extent, but it would be far better for the contractors themselves to answer questions of this character.
11086. In your item for timber you first of all take the building of seventeen spans at a certain price, and you distribute it over the entire quantity per yard of material. Coming to the forty-two small arches, are those forty-two arches outside that? Yes.
11087. You have put down £3 10s. for the putting in of that timber—is not that excessive? It is these arches that have brought down my second price as compared with my original price. Putting it all in like that reduces the cost per cubic yard.
11088. But do you say that it costs £3 10s. to set out three pieces of timber for one of these little arches? That is the total cost for the arch.
11089. Contractors do not waste money as a rule. The contractors would make a few centerings for these small arches, and those centerings would be re-used. That item therefore disappears? They would have to leave some of the centerings in for a considerable time.
11090. But only about twelve of them? They cannot strike the centres at once.
11091. But you have allowed an amount as if they built a new centre for every arch from end to end of the structure, leaving the centerings in or throwing them aside? I do not think they have done that, but, on the other hand, they could not build an arch and then knock out the centering at once and proceed to build another arch. They would have to leave in some of the centerings.
11092. But you do not say that they make a new centering for every arch? Possibly not, but at the same time you must allow for the centerings being in a fairly long time.
11093. Suppose as a matter of fact the contractors have been using twelve sets of centerings for these small arches? I should expect to see more used.
11094. Did you see more on the works? No; I had to arrive at the quantity myself.
11095. You saw some there? Yes; some were in use.
11096. Did you see any on the ground? No; I did not look for any.
11097. Supposing they were using 12 centerings, that would materially alter your calculations? Yes.
11098. As to your 574 lineal feet of carrier beyond the main arches at 5s. a foot, how do you arrive at that value—is it guesswork? Not exactly guesswork.
11099. But you have taken it roughly? Yes; it was not an important item.
11100. Suppose it turned out that in guessing at this amount you had gone considerably higher than the facts justify, that would make another difference in your calculation? I think you will find that my estimate is not far wrong.
11101. Suppose the contractors are using about 80 feet of this timber-work, and that when that much had been used it could be re-used? Some of it I have no doubt would be used again. I have taken it at 5s. a foot.
11102. But it ought not to be re-charged again and again, ought it? It ought not to be charged again if it is re-used.
11103. As a matter of fact the only charge which could be made in connection with it would be for fixing it? You have to consider the timber.
11104. I am dealing now with the labour. The labour would be not for putting the thing together again, but for shifting it from one place to another? When you have the thing fixed for a certain length of course you could shift it from that length to another, and that might cost from 4s. to 5s. a foot, perhaps more.
11105. Per lineal foot? Yes.
11106. As to the amount of £11 10s., the cost of the grills in the arches and carriers, where do you get that from? I am accustomed to estimates for ironwork.
11107. That is your own estimate? Yes.
11108. If you were told that the ironfounders of the city had made the material at £8 10s., what would you say? I should say that they were making it much cheaper than the price to which I have been accustomed.
11109. Iron is especially cheap just now? That may be so, but the price you name would be very cheap indeed. I think £11 10s. per ton is a very fair price.
11110. You did not proceed upon the basis of what the merchants would supply the iron for? No. I had to base prices upon the cost of the work at the time the contract was let, and I know that £11 10s. was the price at that time. That would be before I went to England.
11111. Did you make any inquiries of the ironfounders to ascertain what they would supply the iron for? I am always making estimates for ironwork, and I do not require to ask anyone.
11112. You did not ask anyone what it would cost? No. Even if I thought the price were different now, that would not alter the estimate I have given.
11113. Where did you get your price of 7s. 6d. per cubic yard for sand? I think that is about the price that is charged. That is the price you will pay for good sand.
11114. For Nepean sand? Yes.
11115. Do you know what the price of sand is as it comes out of the crusher? No; I should have to ask about that.
11116. If you discovered that it will cost 4s. a cubic yard, that would materially alter your calculation? Obviously.
11117. How did you come to fix the cost of a cask of cement at 11s. 6d.? I think I was paying more than 11s. 6d. at the time this contract was let. I think you will find that that is a fair price.
11118. You paid 11s. 6d., I suppose, buying the cement by the single cask? They always let me have it pretty cheaply for the tests which I have to make; I never pay too much for it.
11119. Suppose cement were actually sold at 9s. 6d., and that it cost 10s. a cask delivered on the ground? Then I should say they got it cheaply.

W. H.  
Warren.

5 Aug., 1896.

11120. But that would materially alter your total? Yes.
11121. How many cubic yards are there in each of these compo. arches? 23·6 yards.
11122. Then you will be altogether out in your cubic contents when you put them down at 383 cubic yards? I am not responsible for that. These are the figures which were given to me. Mr. Davis, Mr. Thompson, Mr. M'Creddie, and I met and agreed to take these quantities.
11123. If it works out at 424 cubic yards of compo., that will reduce the cubic yards of concrete? Yes.
11124. And it will make some difference in your calculation when it is worked out? Yes; it would increase the item for compo.
11125. And decrease the item for special concrete? Yes.
11126. Coming to the Departmental estimate for Contract 77—that is, the schedule prices—you could not afford to take 28½ per cent. off the £2 10s. for brickwork? I do not think so; I think that is proved by my own estimate.
11127. But you could not take the 28½ per cent. off the price in the Departmental schedule? I had to do it; I was instructed to do it.
11128. If you took it off, that would make the cost of the brickwork £34 6s.;—could it be carried out for that? I think it would be too low, and I think I proved that by taking the full price, £2 10s., in my own estimate.
11129. The material alone would exceed £34 6s.? Yes, if good bricks were used.
11130. So that you cannot take off the 28½ per cent. if you are to give the full value? No.
11131. Then as to the the 12,190 cubic feet of freestone ashlar at 3s. 6d.? I have taken that at 3s.
11132. If you took 28½ per cent. off that amount it would make it 2s. 7d. per foot; the work could not be carried out for that, could it—that is the material and labour would exceed that cost by a long way? It is a cheap price of course.
11133. Therefore is it not a fact that if you separate the material in the aqueduct from the rest of Contract No. 77, you find that the prices have been placed so low that the 28½ per cent. would really come off the tunnel work? I had nothing to do with the tunnel work. I had the quantities and prices given me and I took them as correct.
11134. You could not very well arrive at a price by taking 28½ per cent. off every item uniformly? I have not done so. My own estimate proves that.
11135. But taking the Departmental estimate there can be no doubt that the prices would be far too low if 28½ per cent. were taken off? In some of the items the price would be too low I think.
11136. Having regard to all the matters which require alteration in your report, do you not think it would be better for you to rearrange it upon the evidence you have given and then resubmit it to His Honor in its rearranged form—is it not apparent to you that with the alterations you will have to make you will reduce the total of £6,098 15s. 8d. by many hundreds of pounds—in fact nearly £1,000? If I were to make a fresh estimate based upon my evidence, it would be equally open to question. It would be much better for you to get some one else to make an estimate and allow mine to stand.
11137. Would it not be well for you to make the corrections you have admitted to be necessary? I should be glad to do that of course, if you wished it.
11138. *His Honor.*] What you think is this, that a man like Mr. M'Creddie, who is constantly engaged in this actual work of measuring and valuing, and dealing with works actually in existence, is more likely to be correct than you are? On current prices, certainly.
11139. Do you think you could make your estimate so accurate as to be really reliable without going into the market and finding out all sorts of things? I could revise it to some extent, as I said before, but it is quite possible that, on consideration, I might not get it down low enough for Mr. Parkes.
11140. I cannot exactly understand what the 140 expansion joints which are given consist of? That was the number given to me. They are put in to provide for the rise and fall of the arches.
11141. But how does the number 140 come in, seeing that there are only seventeen arches? I have simply given the number which was given to me.
11142. *Mr. Davis.*] As to the measurement of the timber—did you intend your measurement to be anything more than an approximation? No; I should never think of measuring timber work in a case of this kind as if I were going to order the timber for the work.
11143. You regard it simply as an approximate measurement, to give you an idea in a general way of the quantity of timbering in the centering, the lagging, and the scaffolding? Certainly.
11144. Will you look at the item of 732 cubic feet at 2s. 6d. per cubic foot;—did you in that 2s. 6d. include the ironwork and bolts? Yes.
11145. Where did you include the labour for actually making the centering in the first instance;—did you include it in the 2s. 6d., or, taking the 7,517 cubic feet at 13s. per hundred, did you include any labour in that? No. I have taken the 2s. 6d. to include the price of the timber and of all the material which you would use in making the centering. It would include the cutting into lengths. The timber has to be cut into lengths. It would not come out to quite the right length when delivered, and it would have to be fitted.
11146. If the 2s. 6d. a cubic foot in the one case, and the 13s. per hundred in the other case, is a little higher than the price at which you could purchase timber, then, seeing that you have included in those prices the labour of cutting up the timber and the ironwork used in connection with it, the price would not be surprising? I fancy the price might be a little above what you would find in a trade list, and for the reasons you have named.
11147. With regard to the cubic measurement for the centering, is it not the usual practice to measure it up by the cubic foot, even supposing the timber itself might be purchased by superficial measurement? Yes.
11148. *His Honor.*] Did it strike you when you were taking some of the timber out by cubic measurement and some out by superficial measurement to make a comparison between the 2s. 6d. per cubic foot and the 13s. a square? No, I looked at the matter in a different way. The superficial measurement has little labour attached to it; there is nothing in it—practically no labour at all as compared with setting the struts and boring the holes for the bolts in connection with the other timber. I measured it just as I should measure a timber bridge. Of course, it would be much cheaper than in the case of an ordinary bridge, and looking at the matter from that point of view, I purposely took a lower price.
11149. *Mr. Davis.*] Let me refer you to the item of erecting the scaffolding, the headings, and the timber work;—you have given the labour for one span of about 82 feet from centre to centre at £33 10s.? Yes.

W. H.  
Warren.  
5 Aug., 1896.

11150. And then in another place you have multiplied that by 17? Yes.
11151. What did you intend that to be—is it the making of the four centres, or is it the work in connection with erecting and removing the centering? It is making and fixing the spandrel piers and arch centering and boxing, making and fixing centres to main arch, lagging, and side-boxing, removing the timbering, and erecting and removing scaffolding. I have not included the joiner's work in that.
11152. You mean that it is erecting? It is erecting in the true sense of the word, taking the pieces of the arch and building them together.
11153. It has nothing to do with the making of the centering? No.
11154. It has to do with the erecting? Yes; we will assume that the centering is ready to be fitted, then you have to bolt it and fit it together—it is the labour for that.
11155. Going back to the item of 2s. 6d. per cubic foot and 13s. a hundred, that would include all the joiner's work, as well as the ironwork, in connection with the preparation of the centering and boxing? Yes, but not the building together. I did not think of that when the matter was mentioned to me just now, but that is undoubtedly the case.
11156. Look at the items under "Cost of Labour on the Monier System;" first of all, you have the building of 17 spans of 82 ft. 6 in. at £60 12s. 6d., amounting to £1,032 12s. 6d.; then there are forty-two small arches at £3 10s. each; that is for labour in connection with the arches;—does it include anything else? They have to be fitted, of course.
11157. Where have you put the price for the iron; I do not see it; I do not see where you have put in any amount, not only for fixing the centering, but for the labour of putting the compo. into position in the arch and in the piers;—is that included in the forty-two small arches? Certainly; that would include the whole thing.
11158. Do you consider, then, that £147 for these forty-two small arches, including the piers, is too much? I do not think so. Mr. Parkes put a number of suppositious questions to me. For instance, he asks whether, if so and so were so and so, such and such a thing would follow, and I have answered him accordingly. At the same time, I must not be taken as saying that these prices are too high.
11159. As to the 574 lineal feet of carrier beyond the main arches at 5s. per foot, you seemed to infer, in reply to Mr. Parkes, that the only labour in that 5s. a foot was the fixing of the centerings;—is that so—where have you got the putting of the compo. in position? I intend that item to include everything, of course.
11160. Does the sum of £147 for the forty-two small arches at £3 10s. cover some of the labour in that connection, and would the same thing apply to the seventeen spans at £60 12s. 6d. each? Yes. Exactly the same thing would apply. It is under the same heading.
11161. And would the item of 574 lineal feet of carrier beyond the main arches, £143 10s., cover the same ground as far as labour is concerned? Yes.
11162. Coming to the cost of the grill in the carrier, you have put down £11 10s. per ton? Yes; I think that is a fair price.
11163. You would not be surprised to find, supposing it were so, that the Public Works Department has contracts at the present time for the supply of  $\frac{1}{4}$  in. iron at £12 per ton, and  $\frac{3}{8}$  in. iron at £11 per ton? No.
11164. That would confirm you in your estimate, would it not? It would confirm my estimate undoubtedly. As a matter of fact, the round iron costs more per ton than does the ordinary common size.
11165. The price paid for the smaller sizes of round merchant iron is higher than the price paid for the larger sizes? Yes.
11166. *His Honor.*] Is the price higher than would be paid for good fencing wire? Yes; the two things are quite different. You cannot take them in the same way.
11167. No. 6 fencing wire, for instance, would be a smaller diameter still? Yes; but this iron is not drawn like wire.
11168. Which is the more expensive, wire or bar iron? Fencing wire, I know, is very cheap just now, but I cannot give you the exact price for it.
11169. You think that it is less ratably, taken by weight? Yes; I should think it would probably be less.
11170. If No. 6 wire were not in much demand, and were only £9 per ton, you would not be surprised to find that you would have to pay £11 or £12 a ton for iron bars? Of course, I never considered the matter in that way; but I know the market prices for iron, and I estimated the price in this case at £11 10s. I thought that a fair thing, and I still think so.
11171. I suppose the price varies according to the demand a great deal? Yes; iron fluctuates a good deal in price.
11172. I mean the demand for a particular make;—a large demand may bring the price down by increasing the supply? Yes, the price is governed by many things which one cannot always foresee.
11173. *Mr. Davis.*] You know that the annual contracts for the supply of the Public Works Department are open to public competition? Yes, I know that.
11174. It is the usual way to introduce competition to get a reasonable, if not a low, price? Quite so.
11175. Take the second item under your heading of timber work—making and fixing centres to main arch, twelve men at 7s. 6d., one at 10s., one day—that is really for the erection, as you have already told us, of these centres? Yes; it works out at £5.
11176. Do you consider now that that is excessive? Of course, I do not consider that it is excessive any more than I consider that many of the other items which have been referred to are excessive. I have pointed out that that is the way I have taken the work. I consider that that is a fair price for putting the centres together. Of course, it may be that I should have taken 7s. instead of 7s. 6d., but I would rather not alter my estimate for a thing of that sort.
11177. Take the next item—making and fixing main carrier, four men at 7s. 6d., and one man at 10s., four days—you have allowed more in that case? Yes; there is more work in the carrier.
11178. The process is more tedious? Yes.
11179. The amount comes out at £8? Yes.
11180. The making and fixing of the carrier is just as tedious, according to your estimate, as is the fixing of the spandrel piers and arch centering? Yes.
11181. Then there is the putting in of the lagging and side-boxing—twelve men at 7s. 6d., or £4 10s.;—are you satisfied with that estimate? Yes, I am satisfied with all the items there.
11182. Your estimate still is that it will cost £33 10s. for removing and erecting, and the work incidental thereto, in connection with the timber work of each span? Yes. I do not in any sense withdraw my estimate

estimate. I should like it to remain, with the correction, of course, as to labour, which I have mentioned to Mr. Parkes, supposing that he has correctly stated the rates. If it should turn out that the labour ought to be 6s. a day, then all I have to say is that it is cheap. I should not have supposed, myself, that it would be 6s. a day.

W. H.  
Warren.

5 Aug., 1896.

11183. *Mr. Parkes.*] Why have you not given us the record of your labour in connection with the construction of these principals? I have given you my measurements according to my habit in these matters. It is a system of measurement I always adopt with bridges. We do not work in the same way as an architect would work in these matters. If I measure up a bridge I measure up the bridge fixed. Just the same thing applies to the price of concrete; my £1 8s. includes the scaffolding and the method of putting it in. That is a parallel case.

11184. But you have included nothing for the labour of putting the thing together? I have not included separately the carpenter's work in making the joints and arranging the timber, and so forth.

11185. Why did you not include it? I thought it better not. It is not the custom, and I should not have thought of doing it.

11186. Would it not be more difficult to do it, seeing that there are only four centres and seventeen spans? It seems to me that this is the most obvious way of making the estimate. I might have gone about it differently had I been an architect; but I think you will find the estimate pretty accurate. The assembling of the pieces and the manufacture of the pieces ready for assembling are quite distinct matters, and that is included in the cost per cubic foot and per ton.

11187. *His Honor.*] But what is the meaning of the removal in this connection if you are referring to the assembling of the pieces after the carpenters have cut them out and put them together? They would afterwards have to be jointed together and put up, and finally they would have to be taken down, I suppose.

11188. The removal would not mean the drawing of the stuff from one arch to another? You would have to take the centering down to a large extent. You could not drag it down bodily. You would have to take it down pretty gently, or you would probably injure portions of it.

11189. Does not the making and fixing practically come to the same thing as the removing, unless the removal means simply the taking down;—as a matter of fact, does the removal mean simply unfixing? Certainly, the centres have to be fixed in position in the next arch, and that would involve a repetition.

11190. A repetition of the item of £27, or whatever the amount may be? Yes; otherwise I should have to include an extra price for doing that work. I have taken the amount out in that way.

11191. I suppose they take the centerings out of the arches in large segments? Yes; it is taken down, to a large extent, in that way. It cannot be taken down bodily.

11192. In how many segments would it be taken down? It is built in three segments. You would have to take the ribs out separately. You could not take out the lagging and all.

11193. *Mr. Parkes.*] How is it actually done, do you know? I should do it in that way.

11194. *His Honor.*] You have not seen the work done, but the chances are that it would be done with as little labour as possible? Yes; of course, one is always liable to correction in an estimate of this kind, because you cannot put yourself in the exact position of the contractors. The contractors themselves would be able to put some of these items right if they are wrong. They will be able to tell you what is actually done.

11195. *Mr. Davis.*] You said, in reply to Mr. Parkes, that 7s. 6d. would be a fair price for Nepean sand? Or good crushed sandstone. I do not know what is actually paid. I know that if I wanted good sand I should have to pay that amount for it.

11196. Mr. Parkes asked you to suppose that sand from the crusher was used in this case; but suppose that sand from a crusher is not used, but that the sand used is brought from North Sydney? Then the price would be altered accordingly.

11197. In connection with the bringing of sand from North Sydney, there would be the freight and the punt charge, and, that being so, you would not consider 7s. 6d. an excessive price? I do not consider it excessive. As I have said, I think it is a fair price.

11198. You have put down the cement at 11s. 6d. per cask? Yes, that is so. I think you will find that that item is all right.

11199. Would you be surprised to find that the rate for the supply of Portland cement in the Public Works Department is 11s. 10½d. a cask? Not at all; because cement has been over 12s. several times.

11200. As a matter of fact, the price fluctuates a great deal? Certainly.

11201. Mr. Parkes asked you some questions relative to the 383 cubic yards of compo. at £1 9s. 8d. He said that, assuming that there were 23·6 cubic yards of compo. in each arch, that would make the quantity slightly more? Yes; these quantities are average quantities.

11202. Assuming that there were 20 cubic yards of compo. in one of these arches, that would make the 383 cubic yards substantially correct? Yes.

11203. The quantities, at any rate, were agreed to by Mr. M'Credie, Mr. Thompson, and myself, as being those which should be adopted for your use? Yes; I am not responsible for them.

11204. Coming to the departmental design and the schedule prices, your estimate is £9,427 8s. 6d., which, with £6,362 2s. (the cost of the tunnels) added, makes a total of £15,789 10s. 6d.—that being the value of the contract at departmental rates? Yes; that is what the Department would have had to pay for it.

11205. Do you think that, seeing that this contract was let in open tendering, and that the lowest tender amounted to 28½ per cent. below schedule rates, and that the rates adopted in this estimate are those rates, that would be likely to be the real value of the work in the departmental design, supposing it were carried out? It is difficult for me to answer that question.

11206. But for all practical purposes you would not say that that would be the real value of the work? Yes.

11207. Assuming that the Department made an estimate which amounted to over £22,000 for the work, and that the lowest tender was 28½ per cent. below schedule rates, amounting to, say, £15,789, that would simply prove that the Department was wrong in its estimate of the value of the work? Yes.

11208. Would you not say, then, that for all practical purposes the £15,789, supposing you had a good contractor who would be willing to take up the tender and go on with the work at that price, was the real value of the work in question? Quite so.

11209.

- W. H. Warren.  
5 Aug., 1896.
11209. It has been given in evidence that Messrs. Carter, Gummow, & Co.'s tender for the departmental design was  $28\frac{1}{2}$  per cent. below schedule? Yes, I understand that.
11210. And their rates worked out at the quantities given in the schedule amounted to £15,757? Yes.
11211. It has also been stated in evidence that the next tender was Mr. M'Sweeney's, amounting to  $25\frac{1}{2}$  per cent. below schedule rates—would you not say that that was pretty conclusive proof that, after all, Messrs. Carter, Gummow, & Co. were not very much out? It is an ordinary difference.
11212. Would it not be pretty close tendering? Fairly close. I have seen it closer.
11213. It would go to confirm the idea that this tender of Messrs. Carter, Gummow, & Co. represented about the real value of the work? You might consider it so.
11214. Or, to put it in another way, would you not consider that the tender at £15,789 would be likely to be nearer the truth even than your own estimate? Certainly. When I made my estimate I took your prices; but the work appears to be worth more—the brickwork especially.
11215. If you were tendering for this job you would put in a tender amounting to £17,660, whereas Carter, Gummow, & Co.'s idea was £15,757—that is the real difference between you, is it not? Yes.
11216. *Mr. Parkes.*] If you knew that you had the right to substitute another job if you had put in the lowest tender, that would affect you when you were tendering, would it not? Possibly. It is quite possible that I might prefer to put in my own plan.
11217. *Mr. Davis.* You prepared an estimate of the cost of the Monier structure without reference to what the contractor might pay his men per day? Yes.
11218. Yours was an estimate of what they would probably pay? Yes; and the same observation applies to all that I have done.
11219. *Mr. Carter.*] If it can be shown that the contractors paid more for wages and more for material than has been suggested this morning, that would show that your estimate as regards those two items is quite within the mark? Yes.
11220. Suppose it could be shown that the pay of certain men engaged upon the work ranged from 10s. to 7s. 6d., what would you say? The probability is that if I had seen those pay-sheets in the first instance I should not have been inclined to make any alteration whatever in my estimate for labour; but I have never seen them before. I have pointed out more than once that I have put in what I considered a fair price against every item.

John Carter recalled and further examined:—

- J. Carter.  
5 Aug., 1896.
11221. *Mr. Parkes.*] Beyond Bandeen, who is the foreman upon Contract No. 77? Mr. Forrest acts as foreman.
11222. Are there any other foremen? Yes. Girling is one, and Crimson is another.
11223. You will find their names opposite the item of "carpenters" on the pay-sheet? They are foremen carpenters.
11224. They do not appear in every pay-sheet, do they? Yes.
11225. Are they not working in the tunnel? No.
11226. Who is putting the timber in the tunnel? There is no timber in the tunnel.
11227. What does Rogers get? He is probably a labourer.
11228. Can you tell us from this book of pay-sheets what men are at work upon Contract 118, and what men are at work upon Contract 77? No, except as regards eight or ten of them.
11229. All of the work in the tunnel is done by piece? Yes.
11230. That is entered in your books? Yes.
11231. All your carting is done by sub-contractors? No; a lot of it is day-work.
11232. Who are the carters on the day-work? Burcombe, M'Millan, Meader, and Booth.
11233. Can you tell me the names of some of the men who are working on the compo. and concrete work? Yes; Bandeen and Girling.
11234. Do they work at the compo.? Yes.
11235. Who else would there be? Cottle.
11236. But he is a foreman? Yes; but he works at the compo.
11237. Can you give us any other names? Yes; there are Byrnes and Kadie. That is all I can pick out from memory.
11238. You cannot remember any more? No.
11239. You have picked out all the costly men? Certainly. They are picked men.
11240. All the rest are 7s. or 6s. a day men? Yes; you asked me about the compo. All the highest paid men are at work on the compo.
11241. You could not tell us the names of all the men who are working on the compo.? There would be about fifteen altogether, I think.
11242. Will that be the general number? No; more often fourteen.
11243. Could you not give me all their names? No; I do not know the names of all of them, although some of them have been working for us for seven or eight years.
11244. *His Honor.*] Do you know their christian names? No.
11245. *Mr. Andrews.*] You do not interfere with the working part of the contract? No.
11246. Some one engaged on the job could give the names if necessary? Yes.
11247. *Mr. Parkes.*] Could Mr. Forrest pick me out in this book of pay-sheets the names of the different men who are working on the two jobs? No.
11248. Why? Because they are never separated, except the concrete gang. There is no distinct work, and if there were nothing doing upon Contract 77 they would be at work on Contract 118. The men are working on both contracts.

George M'Credie recalled and further examined:—

- G. M'Credie.  
5 Aug., 1896.
11249. *Mr. Parkes.*] You had a conference with Mr. Davis, Mr. Thompson, and Professor Warren? Yes.
11250. As a result of that conference you mutually agreed to certain quantities? Yes.
11251. The supplementary specification of Contract 77 sets forth certain things, and one of these things is that the whole of the work in connection with the Monier patent shall be carried out as compo., and not as concrete? Yes.
11252. But you agreed to allow it to go as concrete work? Yes.
- 11253.

G. M'Credie.

5 Aug., 1896.

11253. Concrete of a special nature? Yes.

11254. Do you know whether that work has been carried out? They appear to be carrying it out now.

11255. In other respects you thoroughly agree as to the quantities? Yes.

11256. You formerly presented a report to His Honor, making an estimate of the quantities which you took out of the Government scheme? Yes.

11257. You have now to amend that report; but, beyond the alteration of the quantities, you have not altered the prices? Not materially.

11258. It is for the purpose of amending that report that you present the report which I will now ask you to read? Yes. It is as follows:—

ESTIMATE for "Monier" Aqueducts in Contract No. 77, based upon quantities as rearranged, and according to the work as being executed.

|   |  |       |       |
|---|--|-------|-------|
| 1,533 cubic yards material above skewbacks, comprising—     |  |       |       |
| 383 cubic yards compo.                                      |  |       |       |
| 1,150 " small bluestone concrete.                           |  |       |       |
| 37 tons of iron in grills,—42s. 3d                          |  | £     | s. d. |
| 18½ tons channel iron and tie bars fixed,—£14               |  | 3,238 | 9 3   |
| 15½ " cast-iron cover-plates (fixed),—£12                   |  | 254   | 16 0  |
| 10,625 superficial yards cement rendering (1 to 1),—1s. 9d. |  | 189   | 0 0   |
| 1,016 " " (1 to 2),—1s. 6d.                                 |  | 929   | 13 9  |
| 1,350 cubic yards sandstone concrete,—22s. 6d.              |  | 76    | 4 0   |
| 158½ " bluestone concrete in skewbacks,—40s.                |  | 1,518 | 15 0  |
|   |  | 317   | 6 8   |

£6,524 4 8

ESTIMATE for "Monier" Aqueducts in Contract No. 77, based upon quantities as rearranged, and according to the work as specified, signed as contract, and included in bond.

| Four centres, at £53 10s. 9d. ....                         |    |    |  | 214      | 3  | 0  |
| Carrier .....  |    |    |  | 23       | 2  | 0  |
| Scaffolding—75 per cent. charged to Monier .....           |    |    |  | 20       | 17 | 7  |
| Labour, placing in position .....                          |    |    |  | 56       | 2  | 0  |
|  |    |    |  | 314 4 7  |    |    |

£314 4s. 7s. divided between 1,533 cubic yards gives 4s. 1½d. per yard.

4th August, 1896.

I may add that, if you deduct the amount of £6,524 4s. 8d., the estimate for the Monier aqueduct, based on quantities as rearranged and according to the work as being executed, from £10,207 12s. 6d., the estimate for the aqueduct, according to the departmental plans upon the rearranged quantities, you get a difference of £3,683 7s. 10d.; and if you deduct £5,995 15s. 3d., the estimate for the Monier aqueduct in Contract 77, based upon quantities as rearranged, and according to the work as specified, signed for in the contract, and included in the bond, from the £10,207, you get a difference of £4,211 17s. 3d. I might state, in connection with the quantities of timber we have taken out, that we went out and looked at the structure. We measured the size of the principals and supporting timbers, and if you compare our totals with those of Professor Warren you will find that there is only a difference of about 900 feet super. in the total quantity, and this difference may be accounted for by Professor Warren taking the 4½ in. timbers as 6 inches. Our calculations are based upon what we are paying from day to day, and from what we know we can get the material delivered at. The difference between the two estimates apparently comes in in the price which Professor Warren has put down for the purchasing of material. This report is made in conjunction with Mr. Thompson. There was a little difference between our valuation of the concrete, the amounts being 22s. 6d. and 21s. In this report Mr. Thompson's price is put in.

11259. You have had a good deal of time to look over this contract, and you will swear that your valuations are, to the best of your knowledge, correct? Yes.

11260. Upon what do you base them? I base them upon what we pay for that class of work. Of course the principals, the timbering, and all that sort of thing, are common to ordinary building construction, and we carried out a great deal of that. We know from the prices which we pay from day to day what should be estimated for that, and I am satisfied that our prices will be backed up by the best builders in the country.

11261. Have you made inquiry of merchants as to the value of material? Yes.

11262. And you base your estimates also upon these inquiries? Yes.

11263.

G. M'Credie.

11263. Have you made inquiry as to the value of labour? Yes.
11264. And your estimates are based on the ruling rates? Yes.
11265. I asked you yesterday to go out to Contract 77 and to make a most accurate measurement of the whole of the timber in the work? Yes.
11266. You made that accurate measurement? Yes; we measured all the constructive timber.
11267. Were your measurements checked by others? Yes.
11268. Were any faults found in the checking? No.
11269. Would there be any difficulty in measuring the timber? No.
11270. Is not all similar timber work measured out by the superficial foot in the trade? Yes. You buy Oregon by the superficial foot, and also hardwood. You would buy sawn hardwood cheaper than hewn hardwood. You can buy sawn hardwood delivered in any part of the city at the prices we have estimated. For hewn hardwood—that is the big timber—you would pay at 1s. 7d. per cubic foot. The other timber would be sold at 9s. 6d., or even as low as 8s. 6d., per 100 feet superficial.
11271. Those prices can be confirmed on reference to the market rates? Yes.
11272. As to the Monier structure,—in taking out your estimate, you have not made any allowance for what would be called contractors risk, have you? No.
11273. Why? The contractors risk is generally covered by the profit. I never heard of such a thing being taken out separately.
11274. What about supervision? The same thing applies to that. Profit is supposed to pay for risk and supervision. The rate paid for supervision comes to about £6 a day; that is for the supervision of a single arch. The Government have their own men to supervise the carrying out of the work. The working foreman is the man responsible for supervising that part of the structure, and he gets 10s. a day.
11275. As to tool-sheds and barrows, and the water-pipes for taking the water to the concrete—the contractors remove those afterwards? They are never included in the contract price.
11276. Did you ever hear of such things being added to the contract over and above the percentage of value? No.
11277. What was your labour for putting in the compo.? It came to more than Professor Warren's estimate for labour. It was 7s. 1½d. as against 5s. 1d. per yard.
11278. You have looked through the departmental plans, including all the tunnel work and work of that sort which is not in the aqueduct itself, and I want you to tell me which bears the heavier profit—the work in the aqueduct or the work in the tunnel? It appears to me, as far as the prices are concerned, that the tunnel bears the heavier profit. The price of the brickwork in the aqueduct, if you reckon it up according to the way it is specified, is very low.
11279. What about the price for sandstone concrete? That is right enough.
11280. Will it bear 28½ per cent. off? That would bring it down to about net cost.
11281. Will the brickwork at £2 10s. bear 28½ per cent off? No; I do not think so.
11282. What would the best bottom block stone, such as you use in buildings of a first-class character, be worth? About 2s., I suppose. I do not know what they are charging now.
11283. Take the best stone which architects use;—how much would have to be paid for it? I have paid as much as 2s. 6d. a foot for good stone.
11284. For specially-picked stone? Yes.
11285. The general price would be about 2s.? Yes.
11286. Can you get the Waverley stone cheaper? I do not know; my experience applies to the best Pyrmont stone.
11287. In connection with this same question, are the prices for excavation at 65s. a yard and 60s. a yard excessive? I have not gone into the tunnelling part of the contract at all. I merely glanced through the prices.
11288. But what effect would they have upon the general contract if 28½ per cent. were taken off;—what portion would it most affect? I do not understand that the contractors make up their prices in that way at all. The 28½ per cent. is only a sort of guide to them. They take their estimates and put them down together, striking their prices opposite each item; and they then put down the amount for which they are prepared to do the work.
11289. But what items will best bear the 28½ per cent. off? I have not looked into that matter at all. I have been fully occupied with the aqueduct.

William Thompson recalled and further examined:—

11290. *Mr. Parkes.*] You formerly presented a report as to the value of the Monier arch, independently of Mr. M'Credie? Yes.
11291. You made that report upon certain calculations which you made yourself, and upon the calculations of the Department? Yes.
11292. You agreed in conference to certain quantities? Yes.
11293. Therefore it is necessary that you should alter your former valuation as far as those quantities are concerned? Yes.
11294. But not as far as the values are concerned? No.
11295. You now, in conjunction with Mr. M'Credie, have settled between yourselves what prices were the ruling prices during the time this work has been carried out, and you endorse the report which Mr. M'Credie has presented? Yes, in every particular.
11296. With reference to the timber which has been used on Contract 77, you yesterday accompanied Mr. M'Credie when he went out to take the measurements? Yes.
11297. Do you feel sure of the measurements you then made? Yes.
11298. As to the values of the material included in the report which Mr. M'Credie brought up, can you guarantee them? Yes. I can guarantee them as fair values.
11299. Upon what are they based? Upon our daily practice. They are prices which we pay every day.
11300. For whom would you be doing this pricing work? For contractors.
11301. For the general contracting public? Yes.

W.  
Thompson  
5 Aug., 1896.

George M'Credie recalled and further examined:—

- G. M'Credie. 11302. *Mr. Davis.*] Do you know of your own knowledge the practice of contractors in preparing tenders upon Schedules similar to those in use in the Sewerage Branch? Yes.
- 5 Aug., 1896. 11303. Do you know what the practice of Messrs. Carter, Gummow, & Co. is in that relation? No; I do not know anything about their practice.
11304. You do not know what they would do in putting in their tenders for Contract 77? No.
11305. You are not in a position to say whether they would take a percentage off one item and a percentage off another item? No; I did not say they did.
11306. How long ago is it since you paid 3s. 6d. per foot for Pymont block stone? When the Post Office was being built.
11307. That is a good while ago? Yes.
11308. It would be about 1880? I cannot say. It is a long time ago.
11309. Things are slightly altered since then? Yes.
11310. You appeared to have compared the cost of the work in the tunnel with the cost of the work in the aqueduct in this particular contract? No; I have not had anything at all to do with the tunnel. My instructions were to compare the aqueducts, and I am not prepared to go into matters affecting the tunnel unless I go thoroughly into the whole contract.
11311. But you answered Mr. Parkes' question as to the profit or otherwise likely to be made upon the tunnel as compared with the aqueduct at the rates given in the schedule? I think I have made it sufficiently plain that I will not deal with any matter into which I have not gone very carefully.
11312. You are continually getting tenders for engineering and architectural work, I suppose? Yes.
11313. I suppose it is the practice of your firm to recommend your principals to accept the lowest tender you receive for any given work, as a rule? As a rule, providing the contractor is a good man.
11314. Supposing the tenderer is a good man, you would recommend your principal to accept the tender? Yes; if the tenderer were willing to take up the work.
11315. Even although you thought the tender a very low one? Yes.
11316. Let us go a step further;—supposing the tender were accepted, would it represent the value of the work to the owner of the property? I should think so.
11317. Supposing that before the tender were received you had made an estimate of the work, and the tender did not quite correspond with your estimate—suppose it was, in fact, the lowest, and that it rather astonished you—still you would say that if the tenderer were a good man, and were prepared to carry out the work at the price given, that would be the value of the work after all, and that your value was only an estimate? I should not bother further about it if I took the tender.
11318. But would you look at the matter in that light? I should regard the value of the work as corresponding to the price the tenderer would do it for.
11319. *His Honor.*] You would consider that the tenderer knew something more about market prices than you yourself did? Yes.
11320. *Mr. Davis.*] Have you had cases where you have received exceptionally low tenders, and where, in your judgment, the tenderer was not very wise in attempting to carry out the work, but has, nevertheless, carried it out? Yes; I have received tenders where the amount has been low, and where the work has, nevertheless, been carried out.
11321. You say that as regards the quantity of timber used in connection with Contract 77 you practically agree with Professor Warren? We make 900 feet super difference.
11322. The chief difference between you and Professor Warren is as regards the price of the material? Yes.
11323. You have allowed, as regards boxing, a length of carrier to one span of 82 ft. 6 in.? Yes.
11324. Do you consider that that is sufficient boxing to allow for this great length of carrier? Yes.
11325. You think that the boxing would be able to endure being taken up and put down some thirty times? Yes; I think there is enough margin in our prices to cover all that.
11326. You think that the length of boxing would endure that treatment? Yes, I think so.
11327. Will you elaborate a little your idea of the cost of supervision;—you made a statement to the effect that the allowance of £375 for supervision means about £6 a day;—will you say how you arrive at that conclusion? I am dealing with the price per yard of the compo. in connection with the supervision.
11328. But how did you come to the conclusion that £375 for supervision would amount to about £6 a day? There is an arch put in in a day; that would be 23 yards. The price per yard is 5s. for supervision, and that comes to £5 15s. for supervision. I do not recognise that the contractors have any right to charge for supervision. That is included in the profit.
11329. You think it is fair to put it in the way you have indicated? Yes.
11330. You think it would be fair to treat a man capable of supervising that work in that way? That has nothing to do with it.
11331. You put him on to the work when you want to turn an arch, and then you tell him to go adrift and do the best he can in the interval? I never heard of such a charge being made in my life, and I have been through a good many quantities in connection with contracts.
11332. How many centerings in connection with the main arches have you allowed for? Four.
11333. When did you make the discovery that you had made a mistake of two? I did not make any such discovery. When I was over on the work before there were only two centerings there, but when I went there subsequently there were four.
11334. Will you swear that when you were there before there were only two centerings upon the Johnstone's Creek and White's Creek aqueducts? I will swear that I saw only two, but I have allowed for four now.
11335. What is the price of compo. in your former estimate? Without iron, 30s.; with iron, I think I brought it to £2 2s. 6d.
11336. And now your price is 42s. 3d.? Yes. That explains itself afterwards, because more ironwork was put in the compo. than we put in.
11337. There is a difference between your former estimate and the one now made of 3d. per yard? Yes; we put in the other iron.
11338. You said, perhaps inadvertently, that Professor Warren's price for labour was about 5s.? I think it runs out at that.
11339. You mean for putting the concrete in position? Yes.

William

William Thompson recalled and further examined:—

W.  
Thompson.  
5 Aug., 1896.

11340. *Mr. Parkes.*] Did it ever occur to you to see where the profit lay in the Departmental scheme for Contract 77? No; as I said before, I do not know much about the value of the tunnel work—the gadding and blasting, and so forth—but I know that there would be a dead loss on the aqueduct with 28½ per cent. off. It would be ridiculous to take 28½ per cent. off the brickwork and the moulded stone. You cannot take every portion of the schedule in that way. [*Vide Appendix No. 42.*]

11341. Does not that show that 28½ per cent. must come off the other work? It shows that the other work might stand more than 28½ per cent. off. 28½ per cent. off the brickwork would bring it down to 35s. 9d., and we allowed £2, and the stone to 2s. 6d.

11342. Have you looked at the tunnel and concrete work, and other work generally, outside of the aqueduct? All that I did was to take the Government quantities once.

11343. *Mr. Davis.*] In making one of your former estimates in connection with Contract 77, including the footings, you brought out a total of £6,629 16s. 8d.—I mean the estimate concerning which you say you have checked the various items in the Government schedule? Yes; that was your own money. All that Mr. Parkes asked me to do was to take the quantities. I cannot touch upon the value of the tunnel and excavations.

11344. But, at the schedule rates, you agree that the work in the tunnel is £6,629 16s. 8d.? Yes.

11345. Will you tell His Honor whether you consider that the work in the arch of the description shown in the Departmental plan for Contract 77, in brick, is worth more or less than the small arch in the tunnel, 4½ inches thick? The only particular in which the 4½ inches would increase in value would be in the extra centerings, but work of the class you have in the aqueduct—white and red double-pressed brickwork—is the most expensive class of brickwork you can have.

11346. Supposing the same class of brickwork was specified for the tunnel as for the aqueduct, what would you say then as to the relative value of the two classes of work? They would run on parallel lines as far as value is concerned.

11347. Would you say that the 4½-in. brickwork in the tunnel was more costly than the thick brickwork shown in the aqueducts? No, I would not say that at all. You could not get more expensive work of the kind than you have in the aqueduct. The only additional cost would be the extra centering in the tunnel. In ordinary building operations the bricklayers do not reckon much on the thickness of the wall.

11348. Would it add to the cost, the extra centering in the tunnel? No; very little.

11349. Confine yourself to the labour entailed in putting in the brickwork in a thick arch such as I am pointing out;—do you think a bricklayer would lay more or less bricks in that arch than in a 4½-inch arch? He would lay a little more in the thick arch; but then there is the whole of the facing to be considered, and also the parapets and spandrels.

11350. Taking that into consideration, which brickwork would cost more—the thin or the thick? The thin would cost a little more, so far only as concerns the arches.

11351. Taking all things into consideration, would you say that the cost of thick brickwork is more than that of the thin brickwork? In this particular case I do, because the aqueduct work has to be neatly struck, whereas the tunnel work is rough.

11352. Have you had anything to do with the receipt of tenders? Yes.

11353. Do you know whether it is the general practice to accept the lowest tender, providing the tenderer is a substantial man? Yes. Other things being equal, of course, the lowest tender would be accepted.

11354. Would you regard the lowest tender for a job as representing the value of the work? By no means.

11355. Supposing you made an estimate for some work and found that you had a tender 20 per cent. below it, would you say that your estimate was the true value of the work, or would you say that the tender 20 per cent. below your estimate was the true value? I would not say that the tender was the true value.

11356. Would you say that your estimate would be the true value? It might be.

11357. And the tender might also be the true value? Possibly.

11358. You know Mr. M'Sweeney—supposing a man of his standing, who is pretty familiar with the value of work generally, and more especially sewerage work, and who has been engaged for some years in putting in tenders, put in a tender for Contract No. 77 25½ per cent. below schedule, and that Messrs. Carter, Gummow, & Co. put in another tender 28½ per cent. below schedule, you would say that Messrs. Carter, Gummow, & Co. were not much out in their idea of the value of the work? Not on the work as a whole, for the percentage is taken off the schedule as a whole and not off any particular items.

11359. Do you know what they did in respect to Contract 77? I know that that is the only possible method of arriving at a percentage on the cost. It is necessary to take a percentage off the whole.

11360. You say the cost of the brickwork in the tunnel and the cost of the brickwork in the arch will be pretty much the same? It may be as far as this particular work is concerned; but, as to that, there are 1,850 yards in the one case and 150 in the other. I do not see where the comparison comes in.

11361. Suppose you had alternative tenders, one at £15,500 and another at £15,757, and that they represented different designs, and that after examination you concluded that these designs would answer the same purpose and that they had equal merits—supposing that to be the case, and that you had to decide which tender to accept, which would you take, the lowest or highest? In taking the alternative tender you have nothing to guide you.

11362. But which would you do? I would not take any price without competition, because £15,500 might not represent the value at all, being the only tender for the alternative design.

11363. Your quantities and prices are, to the best of your belief, correct? Yes, the amended ones.

11364. Your prices are based on the present market value of the work? No.

11365. Not the market value of the work twelve or eighteen months ago, but its market value at present? We have taken the old value as regards timber, &c. Oregon is cheaper now, and the same remark applies to hardwood and cement.

11366. You took the old rates for timber, then? Yes; they are cheaper now. Cement is also cheaper now.

11367. You took the old price for cement? 9s. 6d.

11368. To what period did that apply? To the last ten or twelve months.

11369. You did not take the price of cement fifteen months ago? No, but it altered very little.

11370. *Mr. Parkes.*] The prices you took were from information given to you as to actual payments made by Messrs. Carter, Gummow, & Co.? Yes. As to the cement, I understood that the price was 9s. 6d.

11371. The full value, with cartage, would be 10s.? Perhaps so; but 9s. 6d. is what we allowed for cement.

11372. That is the purchase value? Yes.

FRIDAY,

FRIDAY, 7 AUGUST, 1896.

Alexander Dean sworn and examined:—

- A. Dean. 11373. *Mr. Parkes.*] What are you by profession? A builder and contractor.  
 7 Aug., 1896. 11374. What has been the length of your experience? I have been fifty-three years in the building trade and forty years a builder.  
 11375. Have you carried out much work in the city of Sydney? Yes, a good deal.  
 11376. Have you done other contract work outside of building construction? No; my work has been principally building construction.  
 11377. Have you had any experience in concrete? Yes.  
 11378. Has it been extensive? Very. I have laid the foundations of some very big buildings with it, and I have built altogether in concrete.  
 11379. Have you also had a good deal of experience in the making of cement mortar? Yes.  
 11380. What is your opinion of the crushed sand made from sandstone from the neighbourhood of the city of Sydney, used as a sand in the making of cement mortar? I would not use it at all. It is of a loamy, fatty nature. It will make a good mortar, but it kills cement.  
 11381. In what way? The fatty or loamy substance does that.  
 11382. Can you mention instances in which this has taken place? Many. I remember that on one occasion I was arbitrator on a large job, or dispute about several matters, cement being among them. I was surprised to find the mouldings had fretted away, and I could not make it out. Evidence came before me with reference to the use of loam, and, on going to the building and using a magnifying glass, I found that loam had been used. It makes clean mouldings, but it frets away; it will not last.  
 11383. Have you tested the sandstone round about the city of Sydney at any time? Yes.  
 11384. I mean as to its nature? There could not be better stone in the world than the Pymont stone. The sandstone otherwise is good for building, but it is not good for work upon which there is much wear and tear, such as kerbing and guttering.  
 11385. What causes the fretting away in the case of buildings? There are many causes. The stone is something like timber; it wants wet and sun. If the stone is put in a position where it may become wet and where the sun does not get to it, it will fret away.  
 11386. If there were no clay or fatty substance in it would it fret? Not nearly so much, especially the Pymont stone; it very seldom frets.  
 11387. Have you examined the drawings of the aqueducts which are being built at Johnstone's Creek and White's Creek? I have seen them, but I have not examined them carefully. You must bear in mind that I do not know much about bridges or sewers; I am more in the building line. I have done a lot of sewerage in connection with buildings; but I do not profess to be a judge in matters concerning main sewers. My sons are both more in active business than I am now; and they, I am sure, will be happy to give you the information.  
 11388. You notice that the carrier and the arch in the Monier design is a very light structure;—if the arch were built of 3 to 1 compo., and the upper structure of 5, 3, and 2 bluestone concrete, the sand being crushed from stone taken out of the ground in the vicinity of Annandale, would you say that the material in the structure would be free from shrinkage? It would not.  
 11389. Does concrete, when it has once shrunk, expand again. No.  
 11390. Is that your experience? Yes. When it has once set it is always set, if the work is faithfully done.  
 11391. If the sand is from stone obtained in the district of Annandale, you think there would be likely to be a shrinkage in the works? Yes.  
 11392. Do you think the presence of an iron grill, composed of bars of 3-8ths and 3-4ths in thickness would prevent the shrinkage? No.  
 11393. Suppose there are mastic joints here and there in the superstructure, and that a portion of the arches and piers have not mastic joints, what then would be the effect of the shrinkage upon the lower portion of the structure? It will shrink and, I suppose, crack.  
 11394. It will then leak? Of course if it shrinks and cracks, that would cause leaks.  
 11395. You know Nepean sand very well? I know it well.  
 11396. Is it good sand? It is the best sand in the world. I may state that in 1871 or 1872 I was building a large warehouse. The mouldings and decorations in front were very extensive. I was afraid to use the Surry Hills sand, and not knowing the Nepean sand I sent down to Melbourne for forty or fifty loads of Yarra Bend sand. I wanted to get rid of the fat which I have spoken of. That sand came up, and was used in the work.  
 11397. The Yarra Bend sand is disintegrated bluestone, is it not? No; it consists of small crystals; it is a splendid sand. I was about to say that we had just as good a sand in the Nepean sand, but it was not known at the time to which I refer. There is no better sand in the world than the Nepean sand.  
 11398. Have you ever seen crushed sandstone used by private architects in the city as sand in building construction above ground? No.  
 11399. Have you ever been asked to use it? No.  
 11400. Do the architects and builders shirk using it as being dangerous? I would not use it.  
 11401. What has been your experience as to the standing of concrete in long lengths without shrinking? I have used concrete in long lengths, and I never remember a single shrinkage where bluestone and first-class sand were used.  
 11402. After the material has once set? After it has once set; for instance, Mr. Tooth's house at Darling Point is built on sand. The whole is in concrete, and it is not cracked. I am referring now to the foundations.  
 11403. That would be work underground, but what about the work above ground? I could not say as to that.  
 11404. In the making of the composition, it is an essential thing that you should have the very best of material? Yes; it is the cheapest in the long run.  
 11405. You have looked at the prices put down against the Government quantities for this work by Mr. George M'Creddie? Yes.  
 11406. What do you think of them? I think they are very fair prices. I have not only been over them myself, but my sons have been over them, and we found the prices fair in every sense of the word. I have not one objection to raise in connection with them.

11407.

11407. You have a good knowledge of the price of labour and material in and around the city? I am not so closely in touch with it as I was some years ago. My work now is more in the nature of superintendence. A. Dean.  
7 Aug., 1896.
- 11407½. Will you look up the tender-sheet in detail in Contract 69? Yes. [*Vide Appendix No. 43.*]
11408. You and your son tendered for that job? Yes.
11409. You will find that the first four items are put down by Carter, Gummow, & Co. uniformly at 9d. The next eight or nine items are put down uniformly at 27s. 6d. Then follow four items at 4s.; further on you will find a number of items at 1d., and then there are a series of items at £16 each;—no other tenders are fixed up in that fashion? None as far as I can see. It is one of the most glaring things I ever heard of.
11410. Did you ever see a tender sent in in that way before? Never in my life. My son called my attention to it yesterday.
11411. Would you like to send in a tender in that way unless you had some previous arrangement in regard to it? I have never seen such a thing in my life before. How could they possibly have gone into the matter, and have put down about twenty items in succession as £16 each. Then there are others at £1 and others at 9d.
11412. You think the contractors could not have worked the thing out? It is utterly impossible that they could have done so.
11413. You think these amounts must have been put down for some special reason? I cannot say. I never noticed it until yesterday. I never saw such a thing before. If you compare it with the other tenders you will find that in those tenders there are scarcely any two items of the same value.
11414. Have you ever heard of a tender such as that receiving consideration? It is most astonishing to me. I cannot account for it in any way.
11415. Carter & Co's price was £45,207, your tender was £58,165, or about £13,000 above them. If you take item No. 8, heavy blasting, at £1 7s. 6d., what do you find your own price to be, the price I have just named being that of Carter, Gummow, & Co.? 18s.
11416. Take the item for bluestone pitchers;—the price given by Messrs. Carter, Gummow, & Co. is £50, is it not? Yes.
11417. What is the price in your tender? 30s.
11418. Taking the prices of Messrs. Carter, Gummow, & Co. right through, from the excess of excavation, and one thing and another, they were finally paid £54,000 for the work? Yes.
11419. If you and your son had been allowed to work upon the same items in the schedule, then comparing your prices with Carter, Gummow, & Co.'s, that would have greatly reduced your tender? Decidedly.
11420. The amount would be £3,000 below Messrs. Carter, Gummow, & Co. when the work was completed? Yes, it would be something like that. I have not gone into the figures.
11421. What idea does that suggest to your mind? I cannot tell you what it suggests; it is so utterly foreign to my knowledge of business matters. It is most extraordinary that all these items in Messrs. Carter, Gummow, & Co.'s tender should come out in the same way, and then that we should charge 30s. for bluestone pitchers while their price was £50. I cannot account for it at all.
11422. There being 12 yards of bluestone pitchers at £50, would you expect to get the number increased to 38, the increased quantity being paid for at the rate of £50 a yard? No.
11423. Did you ever receive such good treatment as that at the hands of the Government? Never.
11424. Then as to the subducts, you notice that they were put in at 1d.? The thing is ridiculous. [*Vide Appendix No. 44.*]
11425. Even supposing they facilitated work on the part of a contractor, you think the price is absurd? Yes.
11426. Would you expect to have to carry them out in connection with your contract? Yes; according to the specification they should be carried out.
11427. Did you ever see a schedule rigged like this in your life? Never in my experience have I seen so many items in a tender come out at the same figure.
11428. What would you think of those who took into consideration such a tender? I really cannot tell you.
11429. What do you generally allow as profit upon a contract—what percentage? That is a rather difficult thing to say in these times. I would be satisfied with 10 per cent.
11430. Would that cover all your supervision? Yes, plant and everything.
11431. It would include your plant, you say? Yes.
11432. In building construction, when a contractor puts up sheds, scaffolding, centering, and things of that sort, does he generally charge those things at their full value against his employers? I should regard them as part of my plant.
11433. And you would take them away for further use on the completion of the contract? Yes.
11434. Did you ever hear of a contractor charging for the houses in which he keeps his materials, his barrows, his tools, and things of that sort used on the job? No; that is part and parcel of the contract. You have the building for the protection of the materials and tools.
11435. But would you add anything on to the contract for it? No; but in some cases some allowance is made for the clerk of works' box, and that sort of thing.
11436. Do you put it in your tender? It is part of the tender.
11437. But do you put on to the tender an amount for tools, barrows, and sheds—things which you remove when the contract is completed? No.
11438. Would you also charge for the water-pipes which are laid to take the water to the concrete? No.
11439. That would not be added to your tender? No.
11440. Would you charge, in addition to the 10 per cent. you have named, 5 per cent. for the supervision of the work? No.
11441. Supposing you were making a centering of entirely new timber—supposing you were making the centre, not under an ellipse arch, but under a segmental arch of 82 feet span, would you think that £34 for labour was a fair price or otherwise? I should think it a very heavy price, but I should have to work the thing out before I could give you a definite answer.
11442. The price I have quoted would include erection and removal? It would take some time to calculate it up.

- A. Dean.  
7 Aug., 1896.
11443. In constructions of that sort you do not put a new principal under every arch; you shift the centering which has been previously used? I could not say; it would depend upon the construction.
11444. But generally you would shift the centering along? Yes; in any sewerage work which I have done I have shifted the centering as you say, but a good deal would depend upon the job. Circumstances alter cases.
11445. Take 3, 2, and 1 concrete, the proportions in the work you have had to do with, and generally run out by the yard—that is, over the whole work;—the 3, 2, and 1 are supposed to be the dimensions of every yard? Yes.
11446. You are paid by the yard? Yes.
11447. By the yard containing those dimensions? Yes; if the specification says that the concrete is to be 3, 2, and 1, you put those proportions in.
11448. To every yard? Yes; in other words, we take three bucketfuls of stone, two bucketfuls of sand, and one bucketful of cement.
11449. It is essential in good concrete work to have uniformity, is it not? Yes; the more uniformity there is the better the work.
11450. There must be so much cement in each yard? Yes.
11451. In proportioning the work that is one of the things to be observed, is it not? Yes.
11452. *Mr. Davis.*] In preparing a tender I suppose you provide the prices at which you tender for the work for some use;—for instance, you have a price for the plant you may use upon the proposed work? Never.
11453. Do not you include that in the amount of your tender? Not specially. We have our plant. It is there, and it is shifted from one job to another.
11454. But you take into consideration the fact that you have bought plant? I am able to tender at so much less, because I have the plant. If I had no plant I should put down the cost of it.
11455. When I asked you just now whether you had a price for plant, what I meant was this: that it is not usual for builders and contractors, even in respect to plant, to give it for nothing? If I have all the necessary plant and appliances I tender accordingly. It will be part of my profit. I know that I shall not have to buy it.
11456. Coming to the schedules, I will read you some prices from your own tender for Contract 69. Take item No. 23. You have 20s. per lineal yard for subducts in hard rock, and 10s. for subducts of 6-inch internal diameter, 15s. for subducts of 9-inch internal diameter, 18s. for subducts of 6-inch internal diameter, and 20s. for subducts of 9-inch internal diameter. I want to know whether you consider that that represents the true value of the earthenware pipes? I did not take out these quantities myself. You are asking me questions about a matter I know nothing of.
11457. But you expressed an opinion as to 1d. per yard being a ridiculous price—what would be the price of a 6-inch pipe per yard? I could not say from memory. I daresay it might be about 1s. a yard, but I could not answer the question definitely.
11458. You had a very decided opinion about the price of 1d. per yard? Yes.
11459. Would you not think that your price of 20s. a yard for 9-inch pipes, and 18s. per yard for 6-inch pipes would be equally ridiculous? That would be in hard rock. You might have to go 6 feet or 4 feet deep.
11460. But you get paid for the excavation apart from the subduct? This price is for subducts in hard rock.
11461. If you had obtained this job at your prices would you have objected to lay the 9-inch pipe? I take it that this price includes the work in the hard rock and everything.
11462. What would you consider the value of timber for ordinary sewer work, supposing you had to leave it in when it had once been put in? I could not answer your questions upon these points. I did not take out the quantities; they were taken out by my son.
11463. Will you look up item No. 21 in your tender—timber and iron in excavation? Yes; the price is 6s.
11464. Do you consider that a good price per cubic foot? I think so.
11465. You would like to get it? Yes; but there is nothing particular about it.
11466. Does it not resolve itself into this—that you are as deep in the mud as Carter, Gummow, & Co. are in the mire? I do not think you should impute motives like that. I have simply given you the result of my experience.
11467. I am merely going by your own schedule? I am willing to answer any question relating to my experience, but I cannot answer questions as to these quantities.
11468. *His Honor.*] I understand that you had nothing whatever to do with the taking out of the quantities? No, they were taken out by my sons. I should like to say that I had a very important business engagement this morning which will necessitate my attention, but I will be very glad to answer any further questions on Monday.
11469. You will attend for the purpose of cross-examination on Monday morning? Yes.

William Gilliver recalled and further examined:—

- W. Gilliver.  
7 Aug., 1896.
11470. *Mr. Parkes.*] Since you gave your last evidence you have been carrying out a contract in which concrete is used, and in connection with which you have been using bluestone pebbles from the Nepean River? Yes.
11471. How do those pebbles run? We screen the gravel through a  $\frac{3}{16}$ ths screen. That has been approved by the Department.
11472. What result do you get? In 5, 2, and 1 concrete we get  $24\frac{1}{2}$  cubic feet.
11473. That is including the small pebbles? Yes. Everything which does not go through the  $\frac{3}{16}$ ths screen, from 2 inches downwards.
11474. As to the making of sandstone concrete, what is the course followed by the contractors under instructions from the Department upon these works? We have always forked the ballast.
11475. Is that done under instructions? Yes.
11476. What is the fork? It is a ten-pronged fork.
11477. Is it a regulation fork? It is the fork that is always used.
- 11478.

11478. With regard to the practice of contractors, is it a fact that they add 5 per cent. for supervision, in addition to the percentage which they put on for profit;—I presume you have a general knowledge of the mode of contracting? Yes. Years ago we used to put on 10 per cent. for supervision and profit. W. Gilliver.  
7 Aug., 1896.
11479. *His Honor.*] You mean 10 per cent. on to what you anticipate would be the actual cost of the work? Yes. At one time we used to put on 25 per cent.
11480. *Mr. Parkes.*] In making out your tenders under the new system of tendering, where the Government give the quantities and prices, and you give a percentage tender, your percentage would be a percentage proportioned right down the items? In some cases.
11481. You look at the items to see which are small and which are large;—that is the course you follow? Yes.
11482. How do you make out your own tenders? To what contract are you referring?
11483. To any contract? Take the Wallsend and Plattsburg sewer, which is completed. In that case, the Department gave us quantities and prices. The whole of the prices, with one exception, were too small, and we took off  $22\frac{3}{4}$ ths per cent.
11484. But how did you work it out to arrive at that conclusion? We took the losses on some particular items and the profits on others.
11485. And then you averaged it? Yes.
11486. *His Honor.*] You first went through the whole thing, and made what you thought a fair schedule? Yes. For instance, a contractor would have to take into consideration whether the bluestone concrete and sandstone concrete are at good prices, and then it has to be considered whether the quantities are likely to be altered. If in certain cases one class of concrete were knocked out and another substituted it might involve a big loss to the contractor.
11487. In connection with Contract 77, do you recollect what portion of the work bore the best profit? The tunnel and lining and the shafts. I took the aqueducts at schedule prices. I made my tender  $18\frac{3}{4}$ ths per cent. below, taken over the contract as a whole.
11488. You took the price of the aqueduct to be fairly represented by the schedule rates? Yes.
11489. If the work had been for the aqueduct alone, you would have tendered at schedule rates? Yes.
11490. *Mr. Parkes.*] As to the gauging of concrete, you consider that the gauge should run proportionately to the yard, do you not? Yes.
11491. Ought good concrete to have a uniform proportion of cement per yard? We invariably carry out the specification.
11492. *His Honor.*] Do you find that it bulks equally throughout, or that it varies in its bulking when you put in the same proportion of stone, cement, and sand;—do you go into the question of what it will finally come out at in the bulk? No, except as regards the different classes of material, not as regards the cement itself.
- 11492 $\frac{1}{2}$ . *Mr. Parkes.*] Will you describe the way in which you mix your concrete? We put 20 feet of stone, 8 feet of sand, and a cask of cement on top of that. It is mixed dry, and is then mixed wet; it then goes into the work. That is as regards sandstone concrete. The same thing will apply to bluestone.
11493. In the case of the sandstone concrete the ballast is forked? Yes.
11494. Is that done in the case of the bluestone concrete? No.
11495. *His Honor.*] The question is this, having done that, do you afterwards go into any calculations to find out what bulk the concrete actually makes after mixing? No; that can only be done by putting it back into the gauge-box.
11496. Have you done that? Yes.
11497. You mean, I suppose, that you have done it occasionally as an experiment? Yes.
11498. But running through the work you would not make that calculation? No; we only know the quantity of cement used on the job and the number of cube yards that would be paid for, and we average it in that way.
11499. Do you afterwards go into a calculation to find out what relation there is between the quantity of cement paid for and the quantity of concrete used? Yes.
11500. To satisfy yourself that your men have kept up to the mark? Yes.
11501. You do do that? Yes.
11502. *Mr. Parkes.*] What is generally the result in the case of the bluestone concrete—how much cement goes to a yard of concrete? We do not try it by the yard in that way. I have told you on a former occasion the quantity we get out of the cask.
11503. Suppose you had obtained the contract for No. 77 upon the Monier plan, would you expect to receive in addition to your percentage of profit, whatever it might be, a sum for supervision? No.
11504. Would you expect to receive a sum for the complete value of your centering, your plant, and the timber on the job? No, we generally consider that in making our tender.
11505. *His Honor.*] Take the centering, for instance;—in making up your tender originally do you expect to have some value for it afterwards, or do you expect the contract will practically use up the whole value of the centering? We have used one lot of centering in a third contract.
11506. The centering would come in again and again? Yes. But if a contractor were going to discontinue contracting, and were going to sell the centering, he would only get a firewood price for it. At least that is our experience.
11507. *Mr. Parkes.*] Take the sheds, the barrows, and tools—are they of any value to the contractor after the work is done if he is going to continue contracting? Yes.
11508. They are not charged at their neat value? No; we do not go into it in that way at all. We have our plant.
11509. *His Honor.*] But you allow yourselves something in making out your tender for the wear and tear of plant, do you not? Yes. We have a big plant—three or four different kinds of plants stored at the present time. For instance, we have a railway plant and a pipe-laying plant. We have not used them for some years, and we could get comparatively nothing for them; but if we got a job on a railway, for instance, that plant would give us an advantage over a contractor who had to go into the market and buy plant.
11510. Suppose there were a single big job which you were tendering for, you would put into your tender the cost of your plant, but if it were a moderate job, and you were tendering first for one job and then for another, you would consider in your tender merely the wear and tear? Yes; if we had a plant in stock lying idle we should consider that we had a pull over the other contractors, and we might go a bit cheaper than we should otherwise do. If we had no plant and had to buy it, then we should have to take plant into consideration.

- W. Gilliver. 11511. *Mr. Parkes.*] If you had been carrying out this work would you have charged the full value of all the material in the centering and boxing and have added that to the contract? I told you on a former occasion how I arrived at the cost of the Monier work. I think I put down something like 2s. 6d. a yard for the timber right through the structure.
- 7 Aug., 1896. 11512. You consider that a fair value? Yes; of course you would not make a new centre for each arch. If the arches were all the same you would shift the centering from one place to another.
11513. *Mr. Davis.*] As regards the packing of sandstone concrete over the tunnel arch—if a full batch of concrete is not required to be used at once, would it not be the practice to take a certain quantity of cement out of the barrel and gauge just what might be wanted? Yes; I did not quite understand your question about that the other day, but I thought of the matter afterwards.
11514. What I now say is the custom? Yes.
11515. It is the custom, unless you are using a whole cask at once? Yes. The labourer on the top of the shaft would take a bucket of cement and the proportionate quantities of stone and sand provided for by the specification, because the specification says you are not to use concrete which has been standing any time. It would be half set and would be comparatively valueless.
11516. Referring to the relative values of the brickwork in Contract 77, would you consider that the labour in the 4½-inch brickwork in the tunnel would be less or more than the labour in the thick brickwork, such as that you see in the drawing before you—that is in the aqueduct? The aqueduct in the original plan of Contract 77 had a good deal of fancy brickwork about it.
11517. But confine yourself first of all to the labour;—would it be more or less costly to lay 1,000 bricks in the arch of the aqueduct? It would be more costly in the tunnel, especially if it were 4½-inch work.
11518. Supposing, again, that the same bricks were specified for the aqueduct as for the tunnel, would there be any difference in the cost of the bricks? I think there would be about 5s. difference between the radiated and square bricks.
11519. They are not the same price? No; I think the difference just now is about 5s.
11520. Which would be the more expensive? The radiated brick.
11521. And where would the radiated bricks be used? In the tunnel.
11522. So that in respect to labour and the cost of bricks the tunnel brickwork would be more costly than that in the aqueduct? Yes.
11523. As to the concrete, would the labour of putting the concrete into the piers supporting the arches of the aqueduct be more or less than the labour of putting the concrete in the tunnel invert? It would be considerably less.
11524. So that when you come to compare the cost of the lining to the contractor, compared with the concrete in the piers, and the cost of the brickwork in the tunnel to the contractor, as compared with the brickwork in the aqueduct, the comparison, as far as the contractor is concerned, would be in favour of the aqueduct? Yes.
11525. You have told His Honor that it is the custom for the contractors to fork the sandstone metal? Yes.
11526. Have you at any time, after the forking of a heap of metal has been finished, asked and obtained permission to screen the small stuff which has been retained on the screen as metal? No; what we have been allowed to do is this—After forking we have been allowed to put 4 feet, approximately, of the forking to 4 feet of Nepean sand. The same thing applies to both the Rookwood and Parramatta contracts which I had.
11527. Do you remember what was done in the case of the Plattsburg contract? No; Mr. Curtis or the engineer could give you information on that point. I was only there as a visitor.
11528. The pebbles you are using at Parramatta you obtained from the Nepean River? Yes.
11529. They are pretty uniform in size? No; it is unscreened gravel.
11530. But you screen it? Yes.
11531. You eliminate all the sand? Yes; through a ½-screen.
11532. All that you retain on the screen is used as metal? Yes; the screen stands in the gauge-box, and the stuff is shot against it.
11533. Taking the pebble you get in that way, would there be less small stuff in it than you would get in the crushed sandstone used in concrete? There would be considerably more small stuff in the pebble. My experience is that in forked sandstone there is a very small proportion of small stuff.
11534. Are you speaking now of knapped sandstone or crushed sandstone? I am speaking of knapped sandstone; I never crushed any.
11535. As to Inspector Reid, on a former occasion you gave Reid a good character—just such a character as we should have given him; were you always satisfied with him—not that it was any part of your business to be satisfied or dissatisfied with him—as to the way in which he conducted himself in relation to your men. Do you remember what took place at Coogee? I know that Inspector Reid at Coogee was dissatisfied with the crown of the arch. He did not say anything to me about it, but I happened to be out there one morning. It seemed that Mr. Reid had put himself into communication with Mr. Milner, and asked him to come out as he wanted the top of the sewer finished with a smooth face.
11536. And did you express satisfaction or dissatisfaction with Inspector Reid's conduct towards yourself and your men? I had nothing to say as to that. I told Mr. Milner that I thought that if Reid were dissatisfied with the crown of the arch, seeing that I was there at the time, he should have told me of his grievance before going to him.
11537. Did you say that if the job was going to last for any length of time, then, as Inspector Reid was so impracticable in his ideas, and so unreasonable upon certain little unessential points, you would have to make a request for another inspector to be put on the ground? No.
11538. Did you say nothing to that effect? I say this—that Reid is one of the most particular men I have worked under. He is a man who has the specification in one hand and the rule in the other. He is continually measuring. He is what you would call a finnickier man.
11539. He is an awkward man sometimes on a large work? Yes. He is a man who likes things to be tip-top. There is no doubt about that. If a man happened to be on a job beforehand where things went fairly smoothly, and where the inspector was satisfied with a fair thing, he might think that Reid was unnecessarily harsh.

11540. Suppose that after you had rendered the invert of the sewer Reid had asked you to put your men on their hands and knees with coarse sandstone to scour the invert to make it smooth, would you call that reasonable? I should not do it; I should appeal to you; I was not asked to do that. As long as the inspector does not put you outside of the specification there is no room for complaint. Some inspectors of course are better than others. Some are more practical men. W. Gilliver.  
7 Aug., 1896.

11541. Do you know how many casks of cement were used upon the Coogee job? No. There was some borrowing and lending of cement in connection with that work; I know that we had some transactions of that kind with Phillips and Rhodes.

11542. I believe contractors are in the habit of obliging one another, and that cement is passed backwards and forwards in this way with the result that the contractors sometimes get a little bewildered as to the quantity used? Yes; there is frequently a borrowing of cement.

11543. *Mr. Carter.*] Did you ever make up gaugings of the various concretes 5, 2, and 1, 7, 3, and 2, and so on, to ascertain what they came to? I have not in the case of special bluestone concrete.

11544. I am referring now to ordinary sandstone concrete? I am doing that every day.

11545. What has been the results? I gave the results the last time I gave evidence. The  $1\frac{1}{2}$ -inch bluestone came to  $19\frac{1}{2}$  feet, and the sandstone came to  $23\frac{1}{2}$  feet.

11546. As to broken brick, have you ever made any gauging of concrete made with broken brick? Yes.

11547. Do you consider broken brick a good substitute for sandstone? Yes; I have seen it used repeatedly.

11548. It has been stated in evidence that it is the usual practice on big contracts to allow only 10 per cent. for plant, supervision, and profit? As to that, if I had a plant suitable for a particular contract I could very likely cut under another contractor who had to go into the market and buy his plant.

11549. Would you think 10 per cent. a fair thing to put down to profit, supervision, and all that sort of thing, taking Contract 69 as an instance? I do not think it would be enough. I should put a percentage on to the work for plant in taking out my estimate, undoubtedly.

John Carter recalled and further examined:—

11550. *Mr. Parkes.*] Where did you get the sand for Contract 77? At North Shore. J. Carter.

11551. It is crushed sandstone? Yes. 7 Aug., 1896.

11552. Is McMillan supplying you with sand for Contract 77? No; for Contract 118.

11553. Did he cart any sand to Contract 77? Not in connection with the arches. I may have used a little of his sand in the piers.

11554. Do you use any of the sand from the stone which you have taken out of the tunnel? Not upon Contract 77.

11555. Have you crushed any of the stone taken from the tunnel for sand? Yes, I believe so; a little.

11556. Who are carting the sand from North Shore to your contract? Webb and Booth.

11557. Anyone else? No.

11558. How much have they carted? I could not say. Possibly about 2,000 yards. I can easily get the information. You will see their carts going up the street every morning if you look out of the window.

John Young recalled and further examined:—

11559. I suppose there is no more experienced builder in Australia than yourself? No, if age and experience has anything to do with it. I suppose I am about the oldest; I have been at it for 50 years. J. Young.  
7 Aug., 1896.

11560. What contracts have you carried out? All sorts.

11561. Have you ever tendered for the Victorian Government? Yes.

11562. For the New South Wales Government? Yes.

11563. For the Queensland Government? Yes.

11564. For the South Australian Government? No; but I have tendered for the Governments of Tasmania and New Zealand.

11565. Were you not at one time President of the Contractors' Association? Yes; I was President of the Public Works Contractors' Association here for some seven or eight years, and previous to that I was for seven years President of the Builders' and Contractors' Association.

11566. You have had a good deal of experience in tendering? Yes.

11567. In schedule forms as well as in lump sum? All sorts of tendering.

11568. You often tendered for the Department under the late Mr. John Bennett? Yes.

11569. And you have carried out contracts under his administration? Yes.

11570. Turning to the compiled list of tenders for Contract 69, will you read some of the items in the schedule of Messrs. Carter, Gummow, & Co.'s prices. You will notice that the first four items are put down at 9s.; then there follow a number of items at 27s. 6d., and so on? Yes; I notice that that is so. [*Vide Appendix No. 43.*]

11571. Are you familiar with the specification as to subducts? Yes; I have read it.

11572. What do you think of the price of 1d. per yard for subducts? It is ridiculous.

11573. You would feel inclined to say from the uniform prices appearing in Messrs. Carter, Gummow, & Co.'s tender that the quantities had not been worked out; that is evident on the face of it? May I express my opinion?

11574. Yes; I want your opinion. You say you tendered under the administration of the late Mr. John Bennett;—did you ever see anything of this kind occur under the late Mr. Bennett? No; nor anyone else.

11575. *His Honor.*] What can you, as a contractor, say would be the object of any contractor in tendering in that form? It is not for me to say what the object was, because I do not know what their views may be on such a subject. I know what it looks like. It seems to me to be uncommonly suspicious.

11576. What appears to you to be the probable object? There must be one of three things. From my judgment in such matters, I should say that the contractors must have had peculiar information of some character in reference to the contract.

11577. *Mr. Parkes.*] Where from? From those who know.

11578. Previous to tendering? Yes. Either that or there must have been recklessness and chicanery mixed. If neither of these things happened then the Department must be totally incompetent. There must have been one of those three things.

- J. Young. 11579. Would you expect a tender such as that to receive any consideration whatever if you sent it in? It should have been kicked out; and, what is more, I think it would be to the advantage of this country if the departmental work were done away with and the matter were left to private individuals, because they would never do a thing of this kind. I never in my life saw anything equal to it.
- 7 Aug., 1896. 11580. You will see the schedules of prices in connection with the other tenders; do you see anything of that kind in connection with those schedules? No; all of that is fair tendering.
11581. Take the item of bluestone pitchers at £50 a yard? Yes; that is another ridiculous price. £1 would be ample—more than enough.
11582. Suppose that after the contract were let the 12 yards of these bluestone cubes were increased to 38 yards, as disclosed by the final certificate, the quantity being paid at the rate of £50 a yard, what would you say to that? Well, it is giving them the difference between the price for the 12 yards and the price for 38 yards. The Department might be bound by the contract to give them the 12 yards, but to give them the balance is simply throwing away public money.
11583. Do you know of any parallel case? No.
11584. As a contractor you would expect only the ordinary price to be paid you for increased quantities? That is all I could expect. Of course, the quantity which I executed under the contract I should expect to be paid for at the rate specified; but I should say that the engineer who put in more than the particular quantity specified or agreed upon at this exorbitant rate deserves to be kicked out of the Service.
11585. Take item No. 8, heavy blasting—you would see that Carter, Gummow, & Co.'s price is 27s. 6d.; that John Ahearn's is 16s.; Kerle and Kerle's, 23s.; M'Kenzie's, 13s. 6d.; Holloway Brothers', 20s.; and Deane and Sons', 18s. Only three or four out of the whole eleven exceed Carter, Gummow, & Co.'s price. Does not that show how a tender fixed up in this form can in the long run defeat the Department. I may tell you that that particular item is increased in the actual work by something like 10,000 yards, or £11,000 on that one item;—what do you think of that—is not that a trap to rob the public? I certainly think that it is a trap.
11586. Ought not any officer to have seen that a schedule was arranged for that purpose? It looks strangely like it, but the main objection, I take it, is the receipt of such a tender. The heads of the Department ought to be censured most severely for receiving a tender of that character.
11587. Turn now to Contract 79, if you look at page 333 of the Parliamentary return you will see that it is divided into two parts,—one part is the final statement, and the other part is the final certificate. I want you to look at the first item in the first part, "excavation in tunnels, guttering and gadding;" you will see that it is put down at 63s.; the blasting with 4-in. powder is put down at 60s.; then when you get down further you will find guttering and gadding at 83s.; you will see that "excavation in shafts, road surfaces," is put down at 78s.; excavations in shafts, with 4-in. powder, is also put down at 78s.; if you look at the actual payments alongside of these items you will see that there are 800 yards of guttering and gadding reduced to 21 yards; you will see that the 4-in. powder excavation in hard rock is increased from 3,000 yards to 3,707 yards; you will notice also that the items "excavation in shafts, road surfaces, 75 yards, at 78s.," is increased to 541 yards; you will see also that the guttering and gadding at 83s. is done away with entirely; you will see that the 2-in. powder is done away with, and that the 4-in. powder at 78s. is increased from 2,500 yards to 3,267 yards;—what is your opinion of that form of tendering, and the subsequent readjustment? The contractors had a perfect right to the 75 yards at 78s., but when you increase that item to 541 yards you practically give the contractors £1,500 or £1,600. But there is a more serious thing than that. In the final certificate for this work, I see there has been an attempt to hide what has been done by mixing it up with other work, so as to blind, perhaps, the Engineer-in-Chief. [Vide Appendix No. 45.]
11588. In the certificate, which is a copy of that which would be sent to the Auditor-General, the effect of alterations in the details you have pointed out is not included? No.
11589. What is your opinion of that? I think there is an attempt to deceive, because if it were not so, why not put the precise sum of the description of work done in the final certificate.
11590. From your experience, as a contractor, can you say who gets the advantage of the altered schedule when such a thing is done. Supposing a schedule is readjusted in the fashion in which this schedule has been readjusted, does the Department or does the contractor get the advantage? The contractor is supposed to get the advantage.
11591. What do you think is the case in this instance? The contractor gets an immense benefit.
11592. I think public repute will allow that very few, if any, men in the Colony have had more to do with concrete structures than you have. Will you tell me some of the cases in which you have built concrete work? At the corner of Pitt and Park Streets I have built seven or eight shops almost exclusively of concrete. Then there is the work I did at the Post Office. I have done an immense quantity of concrete work. The cases are so numerous that it is difficult to mention them; I have done concrete work of every kind. I took a fancy to the work in this country even before the architects would use it. That would be 25 years ago, when the architects were very chary of using concrete. I then used it extensively and advocated its use as I do now—in its proper place.
11593. You have found it an awkward thing to deal with? Yes, it is not so easy as it looks. The first thing I may mention in connection with concrete concerns a matter as to which there appears to be some misunderstanding. Concrete never expands; it contracts, but it never expands. It continually contracts, and the more clay there is in it the more it contracts.
11594. By clay you mean loamy substance? Yes.
11595. As to contract 77, which Messrs. Carter, Gummow, & Co. are carrying out—Do you know of your own knowledge whether they are using crushed sandstone as sand? Yes, I have seen it.
11596. They are using sand from crushed sandstone? Yes, I have seen it. I know crushed sandstone by its texture. It is quite different from drift sand.
11597. You have seen it going into the work, have you not? Yes.
11598. As to the excavation taken out of the streets in your municipality, your council wanted the ballast if it were of no use to the contractors? Yes; they had some of it, I believe.
11599. The contractors said it would be of use to them? They said they wanted it.
11600. For what purpose? They did not say for what purpose.
11601. Your opinion of concrete in any great lengths is that it will crack, and keep on cracking? Yes; used in that way, undoubtedly it would crack. I think you will find that I am perfectly accurate in what I say as to this particular work. As far as I can understand it has already done so. I have not seen the work

- work myself, but I am quite prepared to believe that that is the case. After all, I do not need to look at it myself, because my experience tells me that it will crack. J. Young.
11602. You are referring now to Contract 77? Yes; both of those aqueducts you will find will crack. 7 Aug., 1896.
- We shall see by and by who is right and who is wrong.
11603. As to Nepean sand, do you not think that in a work of such importance it would have been better to use that sand? Yes. It would have stood a much better chance if that sand had been used.
11604. Will the iron assist the work? I think it will. No doubt iron is beneficial in concrete. There is something about iron and its use in theory which I have not found in practice. If iron contracts and expands, and if concrete or compo. contracts only, there must be a movement of the iron in the concrete, and that cannot be beneficial, because it destroys the bond. Still, although that is the case, it only proves one thing: it shows that concrete and iron is not the durable thing which brick or stone would be. It shows that there would be a movement in the structure, and that movement going on continually year after year must have an effect upon the material. That effect must be that the structure will not last so long.
11605. It is a common practice to build concrete roofs to houses? Yes; I have done so myself.
11606. But in all those buildings has it been the practice of the builder to keep the concrete mass in small quantities like chequers running between the girders? The more you have in one piece the better.
11607. Always allowing for the play of the iron? Yes.
11608. The reason being that iron requires more play than concrete;—is not that so? Yes; the iron has a different movement from concrete. The concrete shrinks, and shrinks continuously up to a given time—that is, until it is thoroughly dry. Then I admit it does not shrink. In the meantime the iron goes on expanding with the heat and contracting with the cold.
11609. Have you to put under the girders roller plates? Yes; that is done to allow for the expansion and contraction.
11610. The less iron put on the better? Yes.
11611. Did you ever hear of tenders being called for plans made by the Department, and of one contractor being allowed to substitute his own plan upon prices the details of which are not given? I do not see what is the good of the Department if you do that—that is, if you allow someone else to come in and practically supersede it.
11612. In your long practice have you ever been allowed to do such a thing? Certainly not.
11613. Have you looked over Mr. M'Creddie's quantities in the substituted Monier design for Contract 77? Yes.
11614. What do you think of them? I have made an estimate of the quantities given me, assuming them to be correct, which shows that there is a saving by the adoption of the Monier work in the aqueducts—that is, a saving in material—amounting to £3,361. [*Vide Appendix No. 46.*]
11615. That estimate is quite independent of Mr. M'Creddie's estimate? I know nothing about his estimate. That is my estimate.
11616. If his estimate is £4,000 it would be fairly close to yours? I think I have been a little liberal. I understand as well as possible what this class of work costs; I know exactly what it can be done for to a trifle.
11617. Have you ever ventured upon the use of a cement structure for the purpose of keeping out water? I have tried it over and over again, but I find that it will not do so.
11618. You have not succeeded? No; you have to asphalt, and then you can keep out water.
11619. What is considered to be a fair builder's profit? I think they should get 10 per cent.
11620. What would that include? Superintendence, among other things.
11621. Would it include plant? It might or might not. Of course a contractor may have a good deal of plant; and if he can utilise it he does not charge much for it.
11622. With reference to the labour upon the general scaffolding work and centering work, the putting together and forming is not supposed to be the highest class of labour? For centering you want good carpenters, or else they get out of square or are not straight. It is a rougher kind of carpentering than you would require for joiner's work. Although you do not want a joiner, you want a man who can work accurately.
11623. Did you ever know of an engineer in charge of a work for some other person, and being responsible for that work, taking as a surety any man having an interest in the contract? I should have thought he would have been precluded from doing so. I know that I have never given as a surety any man connected with my contracts. I have given some one totally outside.
11624. Have you heard from anyone whether the aqueducts at White's Creek and Johnstone's Creek, in time of rain, keep the water from going through? I have not seen them myself during rain, but persons have spoken to me about them. I remember some one saying to me, "What you said about the compo. and concrete in those arches, Mr. Young, is perfectly correct. I was there the other day, and saw water coming through." They say that that is happening already.
11625. Water is coming through, you say? Yes.
11626. *His Honor.*] You have not overhauled the work yourself? No.
11627. *Mr. Parkes.*] Coming back to the question of concrete, you will notice in the Monier structure a succession of mastic joints in the carrier, but there is a disconnection between that and other parts of the work. With one part of the work rigid, and with the other part moving, would there not be some danger? Of course there would be if one portion is rigid and the other is allowed to contract and expand.
11628. Do you think an 80-foot span would be safe for concrete without a crack? I do not think it is. I would not like to go 80 feet with an arch of that character.
11629. As to sand made from crushed sandstone, Professor Warren says that, according to his tests and analyses, there are only very small particles of clay in it? Whatever clay there may be in it, I know from long experience that it is unfit for concrete.
11630. You say that from your practical experience? Yes.
11631. You know all about the method of testing? I do not believe in these tests.
11632. Is there much reliance to be put in the tests? No; I being a practical man, other persons may think that I am prejudiced, but I am not. There are a good many things which are right in theory which do not come out right in practice.
11633. As to the tests with hydraulic pressure? I have seen these things done by Professor Warren, myself, but I do not believe in them.

- J. Young. 11634. A jerk of the handle by the man working the machine, and it is all up? Yes; there are atmospheric influences and a variety of things which come in to interfere with and upset these tests.
- 7 Aug., 1896. 11635. Can they be properly carried out? There is nothing like absolute practice—doing the thing itself. That is the best test.
11636. I believe the Pymont bottom-block stone is the best in the city? Yes, but even that shrinks.
11637. If top-surface stone stood a test under the hydraulic pressure method, better than bottom-block Pymont stone, what would you say as to the testing? I should feel inclined to smile.
11638. Practical experience as to such matters, after the material has been put in position, is the best test? Yes, I think so.
11639. Do you see any reason to alter the opinion which you have previously expressed as to the different classes of sand? None whatever.
11640. In the case of Contract 77, if there were a powerful shrinkage in the concrete, do you think the iron would stand the tension put upon it? I take it that the iron follows the curve of the arch, and if the arch gives, the iron goes down.
11641. *Mr. Davis.*] Supposing the calculation of the arch showed it to be stable, would that alter your opinion upon the question of stability? I should like to know how you make the calculation. The only calculation I would agree to would be one founded upon experience. No calculation in figures would have any effect upon my opinion.
11642. Suppose the calculation were based upon actual experience? Then I should want to know the material used, where it was used, and how it was used. Material varies in so many places. Calculations made in Europe and other places would have no application to work here.
11643. A great many of the opinions you have expressed this morning are based, I presume, upon your theory? Upon my experience.
11644. Your experience being that concrete does not expand, but merely contracts? Yes; that is my universal experience.
11645. Supposing you happen to be wrong, that would necessarily militate against the opinions you have expressed? Yes; if I am wrong.
11646. For instance, with respect to the oscillation of the iron in the concrete or compo.;—assuming, as you do, that the iron expands or contracts, and that the compo. or concrete only contracts or shrinks, you might be right; but there would be no oscillation supposing the concrete to expand and contract in the same ratio with the iron? You can suppose what you like; I am only telling you what has occurred in my own experience, which has been continuous year upon year. If it upsets your theories I cannot help it.
11647. You say that concrete does not keep out water? Certainly not.
11648. You know of your own knowledge that most of the reservoirs which have been built in this Colony are built of concrete? Yes.
11649. What would you say in the face of that? I should say that every one of them wept more or less. A drip-stone will hold water, but it will let it through, and so will concrete.
11650. There would be a certain amount of percolation, you think, through concrete? Yes.
11651. But beyond that it is all right? Yes; for certain purposes.
11652. Will you turn to your estimate;—you said that you made the difference between the cost of the Departmental design and the Monier design £3,361;—what is the amount of your estimate for the Monier structure?—£7,846.
11653. What does that include? It includes 1,533 cubic yards of material above the skewbacks, comprising 383 cubic yards of compo., 1,150 cubic yards of small bluestone concrete, and 37 tons of iron in the grill.
11654. How much have you put it down for? I have put it down at 56s. 6d. per cubic yard nett.
11655. Without any profit? Yes, without anything of that sort.
11656. What have you put down in the case of the Departmental design? I make a total of £11,207.
11657. You arrive at that conclusion from the estimate you have made? Yes; but I must tell you that the quantities were supplied to me.
11658. Assuming the quantities to be accepted by both parties, your estimate is £11,207? Yes.
11659. You have had very large experience in tendering for works; which would you say was for all practical purposes nearer the value of the work, an estimate that is made as you have made yours, or a tender which you receive from a good substantial man? The tender of a good substantial man, if he gives an honest tender, would be the best guide, that is if the quantities are correct.
11660. Your tender for this work, according to the quantities supplied, would be £11,207; supposing another tender came in for the same work for (say) £9,000, that would be less than your amount, and the other contractor's idea of the value of the work would be less than yours; but if the contractor were a good substantial man, and were able to carry out the work, would his tender not be for all practical purposes the value of the work itself? Yes, if the man were capable of carrying it out.
11661. Would it not be a more tangible valuation than a mere estimate? Then again, you have to bear in mind that persons make mistakes in tendering. A great many persons do that. I used to do that myself occasionally.
11662. Supposing that you were going to build a house, and that you did not want to build it yourself;—supposing you made an estimate that it would cost £10,000, and on inviting tenders in the open market you received one tender for £7,000 and another tender for £7,250,—you would say to yourself, “I must be mistaken; this man who has tendered at £7,000 is a good, substantial man; he is able to carry out the work”;—that being his idea of the value of the work, would it not be the value of the work for all practical purposes? If he were capable of carrying out the work, and gave the necessary sureties, it would be so.
11663. If you got another tender at £7,250, would you not feel inclined to say that the first man was not so far wrong after all? Possibly.
11664. Coming to Contract 77, you will find upon page 163 of the Parliamentary return a list of the tenders received in connection with that contract, and you will see that the lowest tender is that of Messrs. Carter, Gummow, & Co., at 28½ per cent. below schedule, and that the second lowest tender is that of J. M'Sweeney, at 25½ per cent. below schedule? Yes.
11665. Looking at these two tenders would you regard Messrs. Carter, Gummow, & Co. as ordinarily stable men? I believe they are.
11666. And what is your opinion of Mr. M'Sweeney? He is a very good man.
11667. Does he know what he is about? I think so.

J. Young.

7 Aug., 1896.

11668. What would you say in this case, seeing that there was a tender of 25½ per cent. below schedule from Mr. M'Sweeney and a tender of 28½ per cent. below schedule from Messrs. Carter, Gummow, & Co.? I should think it was a reasonable difference of opinion.

11669. You would say that tender No. 1 and tender No. 2 were, approximately, the value of the work? Yes, if they are good men.

11670. You have spoken about cracks in this concrete work;—do you think that the cracks that would be likely to occur would occur within three years after the structure was finished? Yes.

11671. So that, supposing you were going to carry out a structure similar to Contract 77—the structure contained in these aqueducts—and you got a stable man to give you a guarantee for three years, you would be satisfied? I have read the conditions. There is a guarantee of £12,000 and two sureties of £6,000 each, making a guarantee of £24,000 to cover a work costing £15,000. [Vide Appendix No. 24.]

11672. Concerning a portion of the work (say one-half of it), there could be no question—I mean the tunnel portion. There is only the superstructure concerning which there could be any question, and in connection with which the guarantee would be given. It has been stated in evidence that this portion of the work would cost £7,500—would you say that the £24,000 in addition to a fixed deposit of over £700 would be sufficient? I think the security is so great as to be absolutely ridiculous. Of course if you get out of a fair proportion, it might be to the interests of the parties to evade the conditions altogether, to get completely out of the thing, unless they have a tangible security in money.

11673. *His Honor.*] What you mean is that the excess of the cover makes you suspicious as to the *bona-fides* of the whole thing? Yes. A man who has nothing at all may give you £100,000 security, but what is the use of it.

11674. *Mr. Davis.*] Suppose the man is so thoroughly persuaded that his wares are good, that what he is going to give you is of first-class quality and will stand every test—that it does not matter to him what security he gives? All I can say is that I am very sorry for him.

11675. He might give heavy sureties to show his confidence in the work? I say, again, that I am very sorry for him.

11676. Will you turn to page 275 of the Parliamentary return—you will see there a schedule attached to Contract 79? Yes. [Vide Appendix No. 47.]

11677. Will you read the note at the head of it? Yes; it says that the quantities in the schedule are not guaranteed.

11678. Will you now read the heading of the column where the quantities are given;—what does that say? “Probable quantities.”

11679. Taking that heading in conjunction with that note, would you say that the quantities are expected to be increased, decreased, or otherwise? I think that that is the mischief of the whole thing. You give quantities in your schedule, and what I have been accustomed to understand from these quantities all through is that they should be as near the probable quantities of the work which has to be done as it is possible to get at them.

11680. That should be the object, you think? Yes; certainly not anything else.

11681. But you think that that is not the object in this case? When you find that they are multiplied three or four times over you cannot say that that is so.

11682. But what would you conclude from the heading of the column and the note combined? I should conclude that the quantities were not exact to a foot or two, but they ought not to vary more than 5 per cent.

11683. You have had experience in the building of tunnels for sewers? Yes.

11684. From your experience is it possible to say, even to 5 per cent., what the nature of the ground in the tunnel is likely to be before it is driven? You can tell the quantities in the tunnel before it is driven.

11685. But can you tell the nature of the ground? Of course not; I am speaking of the quantities, not the material itself.

11686. Confine yourself to the quantities then. Suppose the ground turns out to be soft, and that when the quantities were put into the schedule it was expected that the ground would be hard? It could be tested so that you would know the ground. You ought to know what the ground is.

11687. Would you say that the same thickness of lining would be required in soft ground as in rock such as you will find in bottom block Pymont stone? That is a matter for calculation.

11688. Supposing you were wanted to put in a thicker lining, the ground being not what it was anticipated it would be, would you expect to be paid for it? Certainly.

11689. And if you did any extra excavation consequent upon the ground not being what it was expected to be, would you expect to be paid for it? Yes. I do not see anything in that.

11690. Supposing you found that the final vouchers of the quantities of a tunnel job did not correspond with the probable quantities given in the schedule before the job was let, would you be surprised? I should not be surprised at an allowance being made for it. Of course something unexpected will sometimes happen.

11691. Take item No. 4 upon page 333 of the Parliamentary return, “Excavation in shafts—road surfaces”? You must allow me to say this in regard to that item—you have 75 cubic yards. I presume there would be no difficulty in ascertaining what the road surface consisted of, or how much of that work there would be to do. There is no underground business about that. If you cannot measure that you cannot measure anything.

11692. Will you turn to page 275;—you will see there the schedule of quantities and prices for Contract No. 77; you will see that not only road surfaces but other elements are included in the item of excavation No. 4; It says, “Excavation in road surfaces, sand, soil, clay, pipe-clay, shale and soft rock only”? I take it that it means road surface in any of those materials. The item is only for surface, that is what it means.

11693. But would you think that it should vary at all? Not to the extent that you have put down here. I hold a very strong opinion about this method of calling for tenders. It is calculated to do an immense deal of injury.

11694. You do not see any reason why the quantity should vary at all? If you cannot tell what is on the surface you certainly cannot tell what is underneath.

11695. Supposing the work extends some distance below the surface—suppose you get shale 20 feet under the surface where you expected hard rock, would that not cause the probable quantities to be increased

on

- J. Young. on that item? I presume you bored before you made your plans, and found out what the substrata were. You therefore knew exactly what you were going to do.
7. Aug., 1896. 11696. Suppose the boring is at every shaft? Even if you bore at every shaft you know before you make your specification what the ground is.
11697. Suppose, after the bores are taken, that they do not give an exact criterion? Then, of course, there would be a little difference; but it should not be very great.
11698. You know that bores do not always come out exactly right? Not exactly; but they are very near.
11699. Will you turn again to page 333, and tell us a little more fully why you expressed such a strong judgment about the variation between the final statement and the final certificate? I find here that in the quantities given upon which the contractors are to tender, there are 75 yards of excavation in shafts—road surfaces. That is increased in the final certificate to 541 yards. That is an item which happens to be at a good price. That is one thing which makes me say so.
11700. Can you tell me of another? I only looked at the schedule yesterday. If you were to give me a few days, I dare say I could find out a great deal more. I think there is enough in what I have already discovered to condemn the practice, in my estimation.
- 11700½. Suppose it is shown that when a contract is let for sewerage and other purposes the schedule containing all these quantities which you see there is sent to the Treasury and to the Auditor-General, and that from those quantities the vouchers sent in are checked by the officers of both the Treasury and the Auditor-General's Department, would that alter your opinion that there has been a design in leaving the quantities out in the case of the final certificate? Nothing would make me think that it is right, because I can see that it is wrong.
11701. Who did you think had been deceived by the final certificate? I think it is very probable that the Engineer-in-Chief was deceived.
11702. Supposing that the final certificate is always put before the Engineer-in-Chief, and that, moreover, the final statement is prepared for his information, and for no one else's, at the time he passes the final voucher, will you say that he has been deceived? I should censure him and others for doing it at all, because the thing is made out wrong, as you can see.
11703. But would he be deceived? In this case.
11704. But suppose he had the final statement before him? Of course, if he took the trouble to compare them and found that they did not correspond that would not be so.
11705. He would not then be deceived? No.
11706. Who else would be deceived? I think the practice of calling for tenders in this way is altogether wrong. I do not think such things ought to be received as tenders; they are not tenders. This tender of Carter, Gummow, and Co., for Contract 77, is not a tender in the proper sense of the word. This method of calling for tenders is calculated to do one of two things. In the first place, the contractor is entirely in the power of the Engineer. On the one hand he can ruin him if he likes, and on the other hand, he can make his fortune.
11707. Have you ever put in a tender yourself where only quantities have been supplied? I take it that if quantities are supplied they should be as nearly as possible correct as far as the work which has to be done is concerned. As regards the tenders, certainly a lot of things ought not to go in at a penny which cost about £1.
11708. You are speaking now of prices; but have you tendered where only probable quantities were given in the schedule, and where you supplied your own prices? If they were only probable quantities I would take them out myself. If a contractor has time to take out his own quantities, and to compare them with the quantities supplied by the Department, and if he finds that the Department has made a blunder, he can take advantage of it, and he deserves to get the benefit of it.
11709. Do you remember when you tendered for the Cook's River syphon? No.
11710. Was it not the same kind of tender as that in Contract No. 79? No.
11711. Was there not the same note at the head of the schedule? There might have been.
11712. Had it not the same heading at the top of the column of quantities? It is a good while ago.
11713. But it may have had? Yes.
11714. It may have been precisely the same kind of schedule? I do not believe it was. I would never have tendered upon such lines as these.
11715. Turn now to the schedule of Contract 69—you will see that the prices of Messrs. Carter, Gummow, & Co. are contained in the second column;—do they not fairly represent the value of the work? I do not think that is a proper tender at all. The prices are just what they ought not to be.
11716. Take the item of filling in at the sides of the sewers, item No. 20;—what would you say is the ordinary value of that work? 1s.
11717. What is Messrs. Carter, Gummow, & Co.'s price for it? 6d.
11718. What is John Ahearn's price? 1s.
11719. What is Kerle and Kerle's price? 2s.
11720. That 2s. would be twice as much as the work is worth in your opinion? Yes; but mine is a genuine opinion.
11721. Take item No. 21, the timber and iron in excavation;—what is the value of the timber used in the trenches, waling, struts, polling boards, and so on? I should say it would be worth from 3s. to 4s. a cubic foot.
11722. That would be a fair charge to make for timber in the trenches? Yes.
11723. What sort of timber is it? Oregon.
11724. What is the size of it? It goes various sizes. There would be other work in connection with it, which I should include in my price. For instance, there is the form in which the timber would have to go in.
11725. Take an ordinary sewer trench;—what would be the value of the timber in that case? Taking the price of the timber, the cartage, and the putting of it in place, I should say that it would be worth 3s.
11726. No ironwork is included in that? There might be a few bits of iron to keep it in place.
11727. A few spikes? The timber for the struts would be round timber cut into proper lengths. What would the waling be? 3 x 9.
11728. And the polling boards? 2½.
11729. That would be hardwood? Yes; it would not be worth quite as much as Oregon.
11730. Taking it all round, it would be worth 3s. a cubic foot in position, including labour? Yes.
- 11731.

J. Young.

7 Aug., 1996.

11731. What is Messrs. Carter, Gummow, & Co.'s price for that? 1d.
11732. What is John Ahearne's price? 2s.
11733. And Kerle and Kerle's? 1d.
11734. Kerle and Kerle appear to have given the same price as Carter, Gummow, & Co.? Yes.
11735. What is Mackenzie's price? 2s. 6d.
11736. And Mr. M'Sweeney's? 3d.
11737. What is Holloway Bros.' price? 5s.
11738. What is Carson's price? 2s. 6d.
11739. What is Dean's price? 6s.
11740. What is Langtry and Owen's? 1s.
11741. What is Parry and Farlrey's? 1s.
11742. What is Stewart & Co.'s? 1d. Owing to the uncertainty of what is meant by the specification I am not at all surprised at these different prices.
11743. The specification explains what is meant, does it not? Does it;—that is the question! I can understand these differences in price with that kind of specification.
11744. Clause 115, which appears upon page 96 of the Parliamentary paper, says:—"As the works proceed, all shoring, timbering, staging, temporary bridges, piling, sheet-piling, &c., shall be withdrawn, excepting all permanent timbering, planking, and piling below abutments, piers of aqueduct, storm-water channels, buildings, sewers, &c., as shown on drawings, where ordered under other works, and in all other cases where, in the opinion of the Engineer, the withdrawing of the same is impracticable, or would endanger the safety of the works, buildings, streets, and other surfaces over and adjacent to the works, when the contractor must obtain an order in writing, signed by the Engineer, to the effect that piling, sheet-piling, shoring, timbering, &c., may be covered up?" I think a man might make almost anything of that. There is nothing in that that you can put down a price for. There is no definiteness about it at all. It is the most indefinite thing of the kind I ever heard of. It is of no use to call that a specification. It might mean almost anything under the sun. A contractor reading that specification, when putting down his prices, would say, "What the devil does it mean? I suppose I must put down something."
11745. Coming to subducts, you know the clause in the specification dealing with them;—what would you say would be the value of the work per lineal yard,—take item No 25, the 9-inch internal diameter subducts? There are two or three kinds of subducts. I should say they would vary from 5s. to 10s. [*Vide Appendix No. 44.*]
11746. What do you include in that price? The cutting for the pipes, and so on.
11747. Suppose the schedule for excavations includes all the excavation in connection with the subducts, and that that excavation is not included in the items from 23 to 27,—what would you say is the value of the remaining work—suppose that all that remains to be paid for is the provision of and laying of the earthenware pipes;—what would be the price? It would vary.
11748. Take the 9-inch pipes? They would be 12s.
11749. Per lineal yard? Yes, the prices would vary from 5s. to 12s.
11750. What is the value of a 9-inch pipe? 18d. a length of 2 feet.
11751. That would be 2s. 3d. for 3 feet? Yes.
11752. Suppose you had not to include the cutting of the tunnel, and that that were included in some other item? If that is so why put it in here.
11753. But is it there? How do I know what your quantities really are.
11754. If it has been stated in evidence that the tunnelling is not included in this item, but is included in another item, what would you say? Of course, I cannot contradict you.
11755. Take items 24 and 25, subducts as specified in clause 8 in more or less hard material, including dry and cement jointing stoneware pipes—that is clear enough? Yes.
11756. What would be the value of a 9-inch pipe per lineal yard, including dry or cement joints? I should want to look carefully into that question. As far as I can understand, the price would be 4s. 6d.
11757. John Ahearne's price for item No. 25 is 8s., and Kerle and Kerle's 5s.? Yes.
11758. And you will see upon page 67 of the Parliamentary return that the total of the office estimate is £64,420 6s. 5d.? Yes.
11759. If, when the work was finished, the office estimate of the quantities actually executed corresponded favourably with the quantities worked out at Carter, Gummow, & Co.'s rates, you will say, I suppose, that there was not so much in it after all? I do not know what I should say. I should want to know all about it before I said anything.
11760. But you see that the prices in all these tenders are higgledy-piggledy? Yes, they are indeed.
11761. You carried out some work for the Government years ago in connection with the fortifications? Yes.
11762. Where were your works? At Middle Head, Steel Point, and Bradley's Head.
11763. Was the work considered satisfactory? Yes, perfectly.
11764. Have you ever heard that Colonel De Wolski discovered defective work there? Not in my work. You are mixing things up. That discovery was made in connection with Macleod's contract.
11765. I am referring to your contract? It is the first time I have ever heard of it.
11766. Have you never heard of Captain Phillips having to repair any of it? Never; nor do I believe it is so. There has never been a breath of such a thing, and I am sure you could not prove it.
11767. Did nothing of that kind occur at George's Head? I did not touch that. That was Macleod's work. You are mixing things up. You could not say a word against my work at Steel Point, at Bradley's Head, or at Middle Head.
11768. *Mr. Parkes.*] That was a case of putting in more stone than cement in proportion? Whoever made the specification in that case did not know how to make it.
11769. *Mr. Carter.*] Have you been contracting lately? Yes.
11770. How long is it since you had your last public work contract? About ten years.
11771. You said you considered Carter, Gummow, & Co. had shown in connection with one of their tenders a great amount of recklessness and chicanery mixed? I still say so. I think it is a reckless tender.
11772. But you used the word chicanery? What I intended to say was that it was reckless, and that it opened the door to fraud, collusion, and chicanery.
11773. But you said distinctly that the tender showed chicanery? I do not think I said so. What I intended to say, anyway, was that it opened the door to that sort of thing. 11774.

- J. Young. 11774. After seeing that other contractors' prices are in and out to the extent that they are, are you still of that opinion? Yes.
- 7 Aug., 1896. 11775. You would say, then, that your remark applies to all the tenders for that particular contract? No.
11776. But the prices are all in and out? I do not blame the contractors; I blame the officers.
11777. Considering that there is only 3 per cent. difference between McSweeney's and Carter, Gummow, & Co.'s tender for Contract 77, would you consider that there was reckless tendering? I think it is reckless tendering on the whole prices. I think if a man prices a thing he should do so according to its value. He should not put upon one item ten times the price, and make it up upon another item. There are cases where the amount is ten times the amount of the Department's price, and in other cases the price is thirty or forty times less. I call that reckless tendering. Perhaps I am using the wrong word.
11778. Have you in tendering often put in prices in this way? Never intentionally.
11779. You always charged the highest value for everything? No, but I got as much as I could get. Sometimes I have made mistakes. At times I have got a tender by making a mistake.
11780. Did it pay you? No, it did not.
11781. Did you ever see any test made in connection with the Monier plates? No; you invited me to one, but I did not go.
11782. Have you seen the test arches? Yes.
11783. Is there any sign of crack in them at the present time? I have seen none.
11784. They have been standing there eighteen months and you say that there is no sign of a crack? I do not know anything about the time they have been standing there. I shall look at the arches in due time when I think the cracks are likely to take place.
11785. Respecting the building at the corner of Pitt and Park Streets,—does the concrete work there show any signs of cracking badly? They would not hold water.
11786. Are they what you would call bad cracks? There are cracks, certainly.
11787. Concerning profit—do you think 10 per cent. is sufficient to allow over the exact cost of a contract upon which you have to supply plant and supervision, and take the risk of the market rates, and other things of that kind? Fifteen per cent. would be better.
11788. Do you think 10 per cent. is enough? I do not think it is; but we have to put up with it sometimes.
11789. In making a calculation in connection with the Monier work, and the exact cost of the material and labour, would it not be a fair thing for the contractor to add to that exact cost a certain amount for supervision and plant? Certainly.
11790. *His Honor.*] Have you ever had anything to do with the making of three to one compo. as distinguished from concrete? I have made it hundreds of times in a similar manner to this, with this exception—that I have not used crushed sandstone.
11791. I mean have you made it to use in bulk apart from rendering? Yes.
11792. Have you associated it with iron? Yes; I have used it with iron hooping interlaced. It makes a good structure. The iron is flat, of course.
11793. You have not seen any of the work going on in these arches? Yes; I pass them every day.
11794. But you have not been on the work when one of these arches was being turned? No; but I have seen them doing it. I know how they do it; because I pass close to it.
11795. You have not been able to compare the state of dryness or moisture in which the compo. is put into the work with the work which you have done? No; I have not compared it, but I see that they use it in a state in which they can shovel it down into the arch, and it must be tolerably liquid to admit of that.
11796. When you have used it, in what state has it been when it has been put into the work before ramming? Not too wet. You could not ram it if it were very wet.
11797. Comparing it with ordinary mortar, in what state would it be? Not so wet as that.
11798. Would it be so dry that you might almost call it a damp powder? Pretty nearly, or you could not ram it closely.
11799. You are aware, I suppose, that the compo. is rammed? I have seen them ramming it, and I knew that it could not be in a very wet state, or it would be all over the place. They would not be able to ram it.
11800. *Mr. Parkes.*] The main point in the schedule to Contract 67, in the tender sent in by Messrs. Carter, Gummow, & Co., is that a number of items, totally different, all in connection with various kinds of excavation, are put down at 27s. 6d. The point is this—could a contractor put down these uniform prices unless he knew beforehand the exact one which was going to be selected? That is what makes it look so bad.
11801. Unless he knew that he was going to be paid upon the special items upon which he has been paid, could he have put down these uniform prices? No.
11802. That shows there can have been no competition, and that some understanding must have been arrived at beforehand? Yes.
11803. The tender all through is alike? Yes.
11804. It is quite dissimilar from the other tenders? Yes. There is an attempt at valuation in the other cases.
11805. If the contractor who was the lowest tenderer had the right beforehand to substitute a plan of his own on a lump-sum tender would you consider that it would be right for the Department to accept that lump-sum tender without knowing if they were getting proper value or not? Certainly not.
11806. In subterranean structures where they use timber as scantling for support one contractor will often have old material which he can use, while another contractor will have to buy it? Yes.
11807. The timber used is often old round stuff that you would scarcely burn, so that in these circumstances the price might be 1d. or 3s.? Yes.
11808. The specification, so far as you can see, says nothing about the timber which is put under ground being of a particular kind;—there is nothing to guide you as to whether the timber may be old timber or not? No.
11809. You have made the estimate you have handed in in detail? Yes. Each item is given as I have worked it out.
11810. Will you furnish the Commission with the details, so that they may be printed as an appendix to your evidence? Yes.

Thomas Williams sworn and examined :—

T.  
Williams.

7 Aug., 1896.

11811. *Mr. Parkes.*] What is your occupation? I am a contractor.
11812. Have you executed any sewerage contract? Yes.
11813. Have you carried out any sandstone concrete? I have done a little of it.
11814. Had you to fork the ballast? Yes.
11815. You were one of the contractors who tendered for Contract 77? Yes.
11816. Did you know when you were tendering that another contractor was going to send in a lump-sum tender, with a plan of his own? Yes.
11817. And yet you sent in your tender? Yes; I happened to meet one of the partners in the firm of Carter, Gummow, & Co.—I mean Mr. Snodgrass—some five or six days before my tender went in. He asked me whether I was going to tender, and I said “yes.” He said, “It is not of much use your tendering, because we are going to tender so low that we shall get the work, on the Monier system.”
11818. That is one of the things which induced you to come to me with other contractors to make a complaint? Yes.
11819. Did Mr. Snodgrass say anything further to you? He said it would not be worth my while to bother about tendering.
11820. You had not put in your tender then? No.
11821. *His Honor.*] You had made out your tender? I had made it out at 16½ per cent. below schedule rates, but when Mr. Snodgrass told me what I have just mentioned I put it in at 6½ per cent. I knew that it was no use tendering with any expectation of getting the job.
11822. *Mr. Parkes.*] Did Mr. Snodgrass say anything further to you about his own tender upon the departmental plan? No; not that I recollect.
11823. Did he say words to this effect: that the firm would not take up their tender if the Monier system were not accepted? Yes; he said that if they were called upon to take up their tender upon the departmental design they could not do so. Mr. Gummow also told me so later on—some two or three months after their taking up the job.
11824. What did he say? The conversation came up in this way: I was driving with Scrutton & Co.’s traveller. It was one day at the crusher near Nelson-street. He said, “McSweeney is saying that Carter, Gummow, & Co. do not know their business.” We were referring to this particular job, and he said, “He might have thought us mad to tender so low, but we should not have taken it up at that price if we had been called upon to do so.” He was referring to their tender, 28½ per cent. below schedule.
11825. Did Mr. Snodgrass say anything to you at any time about a promise that they should get the job upon the Monier plan? Yes; he said his partners had had an interview with the Minister, and he had promised them this—that providing they were the lowest tenderers he would consider their proposal for the work on the Monier system.
11826. Did he say anything further? I do not remember anything further.
11827. If you had had a chance of tendering on the Monier system there was nothing to prevent you as a contractor from carrying out the work had you been the successful tenderer? I do not think so.
11828. Have you looked at the Government quantities? I am not an engineer, but I had a man to take them off for me.
11829. What would you say would be the value of the compo. work with the iron grill running through it on the Monier plan, making every allowance for such work as you would have to put into it? It all depends upon the gauging.
11830. As the quantities are 3 to 1 for compo. and 5, 3, and 2 of fine concrete, what would be the value including all the timbering, boxing, and centering? I should think from £2 to £2 5s. a cubic yard.
11831. That is inclusive of the ironwork? Yes.
11832. Have you looked into the details? No.
11833. Viewing the work as a whole, do you think, from your knowledge as a contractor, that it is a cheaper design in construction than the original departmental design on which you tendered? Yes.
11834. Did any member of the firm of Carter, Gummow, & Co. tell you that they expected to do well with it? No.
11835. You did not hear from them as to the value of the work they were putting into their substituted plan? Well, Mr. Snodgrass said they would make a lot of money out of it.
11836. What would be your feeling with regard to tendering with an office which acted in this way? From my experience I should not think I had any show with the Department.
11837. Have you tendered since? Once or twice.
11838. Would you feel sure that you would get the work if you were the lowest tenderer? I was the lowest tenderer some six or seven years ago, but I could not get the work.
11839. Why? In the first place they were going to give it to another tenderer whose tender was informal. When I kicked up a row about it, they called for fresh tenders. That was the Blackwattle Bay job—a storm-water sewer.
11840. They did not give the work to the next tenderer? They would have done so if I had not seen the Minister about it. It was pretty well arranged.
11841. You were the lowest tenderer? Yes; I made an error of £100 in one of my additions. The next man was lower than I was by rectifying that error, but his tender was actually informal. He was allowed to fill in several items to keep him below me.
11842. Who was the next tenderer? Mr. Wright.
11843. They thought it necessary to re-tender in that case? Yes. I went to see Mr. M’Lachlan and Mr. Barling, and I also had an interview with Mr. Bruce Smith, who had called for fresh tenders. They kept me waiting for six or eight weeks for the job—in fact I sent to England for the buckle-plates thinking that we had the contract. Mr. Bruce Smith said that if I were not the lowest tenderer he would see that the next tenderer took the buckle-plates off my hands.
11844. Do you know if Mr. M’Sweeney at that time had any ill-feeling towards Carter, Gummow, & Co? Not that I know of.
11845. Not in connection with Contract No. 112? Not that I know of.
11846. Did you ever hear M’Sweeney say that he desired to beat Carter, Gummow, & Co. in tendering? No.
11847. When you waited upon me on the occasion which has been referred to, you complained, did you not,

- T. Williams, F.  
7 Aug., 1896.
- not, of the way in which Carter, Gummow, & Co. were allowed to send in their tenders according to schedule? Yes.
11848. *His Honor.*] What was said about that? I never complained about their doing that. Of course every contractor can make up his schedule to suit himself.
11849. *Mr. Parkes.*] Was it not pointed out that Messrs. Carter & Co. were treated in a different manner from other contractors when they had favourable items in their schedules? Yes.
11850. *His Honor.*] What was said as to that? It was said that if the items worked out in their favour they were paid on those items and the items were increased in comparison with the quantities given in the schedule. It was said that their big prices were increased and that the quantities in the case of their small prices were decreased. I remember that the bluestone pitching upon Contract No. 69 was one item which was increased.
11851. What was said to me as to the treatment of other contractors in that respect? I do not quite remember.
11852. *Mr. Davis.*] Was any other item referred to when it was considered that Messrs. Carter, Gummow, & Co. had an undue advantage given to them as to Contract 69;—was any other item apart from the bluestone pitchers mentioned? No, I do not think so in connection with Contract 69.
11853. How many times did you see Mr. Parkes? It might be ten times, or it might be more.
11854. On the first occasion on which you saw him with whom did you go? With Mr. Maddison.
11855. And on the second occasion? There were five or six. Mr. Rhodes, Mr. Butcher, and Mr. Ewing were among the number.
11856. There was a regular deputation then? Yes. What we went chiefly about was the cutting of the drain for the storm-water in connection with the work at Johnstone's Creek. We estimated for that work in tendering. We allowed £300 or £400 for the cutting of that drain, and when we saw that Carter, Gummow, & Co. got it done for nothing we thought we had a right to complain.
11857. Did you ever do any work for me? No.
11858. Did I ever speak to you before? No.
11859. Did you ever do any work for Mr. Hickson? No.
11860. Did you ever speak to him? No.
11861. Have you done work for the Water and Sewerage Board? Yes.
11862. Principally pipe work? Yes.
11863. Did you ever have a job at the Glebe? Yes.
11864. Did that work out all right? Yes.
11865. You know something about the fixing up of schedules;—did you not practice your hand at it on the Glebe job? I might have had more knowledge of the district than the Department had.
11866. Did you make use of your knowledge? To a certain extent.
11867. To what extent? On some items I made a little money and on others I lost it.
11868. What was the price for the excavation in rock? Three shillings.
11869. What was it worth? It would be worth about 10s.
11870. What is the work worth in soft ground? About 3s.
11871. How much were you paid for it? Ten shillings.
11872. You were paid 3s. for rock and 10s. for muck? Yes.
11873. What was the amount of the contract according to tender? Something over £14,000.
11874. And through your fixing up your schedules what did it work out to? I think to between £16,000 and £17,000.
11875. There was £2,000 or £3,000 difference in the amount? Yes.
11876. Coming to the Pymont-Bridge-road work,—you said something about the second tenderer filling up items;—what did you mean? He told me so himself. I am referring to Mr. Wright, who used to be an inspector in the Department.
11877. Do you say that he was allowed by the Department to amend his tender after it had been put into the tender box? Six weeks afterwards.
11878. You are speaking from what he told you? Yes; I went and saw Mr. McLachlan, who said that something like that was going on. Then I went to Mr. Barling, and afterwards to Mr. Bruce Smith. Mr. Michael Chapman introduced me to Mr. Bruce Smith. They were both members for the Glebe at that time. As to the Glebe job to which you have referred—the Water and Sewerage Board do not bore to find out the kind of ground, whereas in your Department you do, and I made use of my local knowledge.
11879. *His Honor.*] In getting round the Water and Sewerage Board? Yes. They did not put down trial bores.
11880. *Mr. Davis.*] How do you make your price for the Monier work from £2 to £2 5s.? Take two casks of cement—that would be £1, and a yard of sand, say 3s.
11881. What kind of sand? The kind of sand you would get in the district from crushed sandstone.
11882. What is the balance made up of? Labour.
11883. And what have you allowed for labour? Four shillings and sixpence for mixing.
11884. And what for putting it into position? I have included the putting of it in position in that amount.
11885. That would be altogether £1 7s. 6d.;—how do you make out your £2 for the Monier structure? When Mr. Parkes asked me his question I understood him to mean the iron as well—the whole design in fact. I would allow 6s. for iron and 5s. for timber. I find I made a mistake as to water and labour—I should have said 6s. 6d.
11886. Is there anything else you have omitted? No.
11887. Do your prices include plant and profit? No, not profit.
11888. What would you say the profit should be? It all depends upon the quantities you are going to put in.
11889. I suppose it is as much as you can get? The more concrete and compo. the less profit per yard there would be.
11890. What would be the profit on this work per yard do you suppose? I should say 20 per cent.
11891. You say you have never had a chance of tendering for the sewerage branch? I suppose I have been too high.
11892. That then has been the real reason. You happen to have had an extravagant idea of the value of the work and your tender has been correspondingly high? I do not think I have been so very high. I was third lowest the other day.
- 11893.

T.  
Williams,  
Aug., 1896

11893. You have seen Mr. Parkes frequently during the sittings of this Commission? I do not think I have seen him more than once in six or seven weeks since this Commission has been sitting.
11894. Do you know Mr. Milner, of the Sewerage Branch? Yes.
11895. You are pretty familiar with him? No; I have talked to him a few times.
11896. Have you seen him just lately? Yes.
11897. Since the Commission has been sitting? Yes; I met him in King-street one day.
11898. You had a conversation there? Yes.
11899. What was the substance of it? I do not remember it just now.
11900. Did you say anything about Mr. Hickson during that conversation? I cannot remember.
11901. Did you say anything about me during the conversation? No.
11902. I suppose I did not cross the horizon of your thoughts? I do not remember saying anything about you.
11903. You did not say anything about Mr. Hickson or myself? I cannot remember doing so just now.
11904. Did you say anything about Mr. Hickson and myself in conjunction with this inquiry? We were talking about this inquiry—about sandstone, concrete, and one thing and another. I said I did not think the way in which stone was taken from Johnstone's Creek and allowed to be used in the works there was fair when Pymont stone had been specified or stone equal to it.
11905. But did you mention in connection with this inquiry Mr. Hickson's name or mine? I might have done so.
11906. In what connection? I cannot remember.
11907. Have you any strong opinion as to Mr. Hickson's conduct in connection with the inquiry? No, I have not, and I do not see that I have any reason for it.
11908. Have you any strong opinion as to my conduct in the past? No; I have not had any business with you.
11909. Did you tell Mr. Milner the object which you and others had in moving Mr. Parkes? No.
11910. Are you quite sure of that? Yes.
11911. Will you swear that you did not? Yes.
11912. Will you positively swear that you did not mention my name or the name of Mr. Hickson in connection with this inquiry? I might have mentioned you, but not as you are alluding to it.
11913. In what way am I alluding to it? You think I was spiteful in doing so.
11914. I did not say so; I want to know in what way I was alluding to the matter? The only thing that I referred to was this—I think I said that if it were proved that these things were true you ought to be shifted.
11915. You said that you would not be content until Mr. Hickson and myself were moved out of the Department, and that that was the object of the whole thing? I never said that.
11916. Did you say anything tantamount to it? No.
11917. Had you any reason for saying such a thing? No. If Mr. Milner says I told him that, he says that which is not true.
11918. You will swear that you did not say it? Yes.
11919. Is not that what you had in view in moving in the matter? No; that was not my motive. What we wanted was to be put upon an equal footing with Carter, Gummow, & Co. at the tender box. That was my only motive.
11920. *Mr. Carter.*] Will you tell me who was present at the conversation which you say you had with Mr. Gummow near the stone-crusher? No person was present beside Mr. Marr and Mr. Snodgrass, who was standing about 50 yards away.
11921. You say that Mr. Gummow told you that we would not take the contract up at 28½ per cent. if called upon to do so? Yes.
11922. You are quite sure of that? Yes.
11923. You know that Mr. Gummow is not a very talkative man, I presume? Yes.
11924. You know also that Mr. Snodgrass and Mr. Gummow are looked upon in the light of authorities in sewerage matters, and the taking up of tenders; they have had a large experience and a good training; they have assisted you and other contractors, have they not, in making up tenders? Not me.
11925. Did not Mr. Snodgrass assist you? No.
11926. Have you never come to him for advice on the subject? No.
11927. Not in connection with the Blackwattle Bay contract? No; I think he is too slippery a man to ask for advice on such a matter.
11928. *Mr. Parkes.*] In connection with Contract 118, did you estimate for that work which was done for the unemployed? Yes.
11929. Do you know if the other contractors did so? I think so.
11930. Do you know it for certain? Yes.
11931. That others did so? Yes.
11932. And it was the unemployed who did that work? Yes, I think so.
11933. Did you see them? I saw that a question was asked in the House about it; I saw the report.
11934. The answer was that the unemployed did the work;—but it was supposed to be done by the contractors, was it not? Yes. We understood that we had to make provision to pump out the water.
11935. *Mr. Davis.*] In the list of tenderers in Contract 118 your name stands the seventh? Yes.
11936. Your tender was 9 per cent. below schedule? Yes.
11937. And the successful tenderer was 20½ per cent. below schedule? Yes.
11938. So that, even supposing what you say to be the case, you would not have been successful in getting the job? No; I do not think so.

MONDAY, 10 AUGUST, 1896.

Alexander Dean recalled and further examined:—

- A. Dean.  
10 Aug., 1896.
11939. *Mr. Parkes.*] You have read the specification as to subducts in connection with Contract 69? Yes.
11940. What work would you, as a contractor, think was included in that? Excavation and everything, I should say.
11941. With such a clause in the specification, the contractors, although tendering honestly, might vary very greatly? Yes; the prices might be higher or lower. One man may have a speedier way of doing the work than another.
11942. It is an uncertain thing what subducts are required? Yes.
11943. But you would take the specification to mean that some subducts would be required? Decidedly, or the clauses should not be there at all.
11944. So that, if you allowed in your tender £1,600 for these subducts, you did so thinking that you would have to put them in to facilitate the working of the contract? Whatever we saw in the specification we measured it up, ascertained exactly what it would cost, and put an amount in the schedule.
11945. But you think that with such a clause as that contractors might easily vary from £600 to £1,200 or £1,600? Yes. I see that our price was 20s.
11946. But the contractors would not put down a price ridiculously low for work of that kind if they thought they were going to do it? No; I cannot make it out at all. As I said before, the specification was laid before us. We read it carefully, measured up the work, and then put in our prices. I see the prices of the other contractors for this particular work all vary. The prices are irregular.
11947. Does that look like *bonâ fide* contracting or not? Yes.
11948. But what would you say with regard to the price of 1d. in Carter, Gummow, & Co.'s schedule—is that *bonâ fide*? It does not look very like it. I see the office rates are 4s., 5s., 6s., 7s., and 8s. Our price might show, perhaps, that we did not understand so well what was required; but the price given in our schedule is our own estimate. That is all I can say.
11949. As a contractor, would you dream of putting the price of 1d. in? Never.
11950. If you put in such a price would it have the appearance of your having an understanding that the work was not to go in? As I said last week, I am not up to these matters at all. I have no knowledge at all of the internal working of the office.
11951. Take the different items in Carter, Gummow, & Co.'s schedule at 27s. 6d.; you will see a whole series of them beginning with "excavation less hard" and ending with "excavation in hard rock (heavier blasting)"; the whole of those items are at 27s. 6d.; would it be possible for contractors to work out prices uniformly in that way, tendering *bonâ fide*? No; I do not think so.
11952. Is the plan of Contract 69 clearly marked with regard to the nature of the soil of the ground through which the sewer goes? The plan shows clay, iron band, and shale. I do not see any rock there at all.
11953. Therefore, it might be termed all more or less soft? Yes, with the exception of the iron band.
11954. Have you ever seen a schedule of prices such as that of Carter, Gummow, & Co. accompanying a plan such as that of Contract 69? It was so issued that we could understand it, I think, and we tendered according. I do not see anything the matter with the schedule.
11955. But would you not think that the schedule should follow the plan as to the nature of the ground? Certainly; the sections you have shown me on the plan show only clay and soft stuff, whereas the schedule makes provision for soft and hard rock, and so on.
11956. *His Honor.*] If you refer to the schedule which is printed upon page 26 of the Parliamentary return you will see that the probable quantities are given? Yes; but you will see the different classes of excavation enumerated there also—for instance, there is excavation in road surfaces, sand, soil, pipe-clay, shale, soft rock, 19,320 yards. The heading also says "excavations and open trenches in more or less hard materials."
11957. *Mr. Parkes.*] Does such a specification give a contractor who is in the know an advantage over other contractors? I do not quite know what you mean.
11958. Look at Carter, Gummow, & Co.'s schedule prices, and you will see that they have a uniform figure for all these items of excavation;—would a uniform figure be likely to come out if a proper valuation were made? No; it would be utterly impossible.
11959. I want you to turn to Contract 77; clause 164 says:—
164. In conjunction with the concrete surrounding sewer, where the latter is built upon arches and in embankments, the contractor to provide, fit, place in position, and wall-in with the concrete, longitudinally, in each corner at top and bottom of concrete lining,  $\frac{3}{8}$ -inch diameter bond-rods in 16-foot lengths. The ends to overlap 12 inches, and tied together with binding-wire, and, transversely,  $\frac{3}{8}$ -inch diameter bond-rods  $4\frac{1}{2}$  inches above soffit of sewer of such lengths as to fit between the outer brick lining, or as shall be directed, spaced 10 feet from centre to centre. The cost of providing, fitting, placing, and walling-in, said bond-rods to be included in the schedule price per cubic yard of concrete.
- Does not that clause provide for practically the same iron bonding which is contained in the substituted Monier plan? I do not know anything at all about that; I have no knowledge of it.
11960. You have not looked at the ironwork there? No.
11961. But you know that there is ironwork in the contract? Yes.
11962. Do you not know the description of ironwork? I have no knowledge of it whatever.
11963. Iron put in concrete in one form or another has the same effect of binding the material together—that is the object of it? Yes.
11964. Do you think the ironwork in the concrete would stop it from shrinking if it be inclined to shrink? I do not think so. Iron and concrete will not work together. If the concrete in itself will not stand, no amount of earthwork or iron will keep it together.
11965. In the Monier plan from underneath the invert to the top of the piers there is no mastic joint; at the top of every pier, however, there is a slit of about an inch or an inch and a half;—if there is to be any shrinkage would it be detrimental to the structure or otherwise to have one portion fixed and another portion movable? If the arches stand in position I do not care very much what you put upon the top of them.
11966. But would the one part of the work, being without mastic joints, have any effect upon the other? I think not; but I must confess that I am more in the building line. I am only speaking in this matter from my general experience. I have not actual experience of the working of that description of thing.
- 11967.

A. Dean.  
10 Aug., 1896.

11967. *Mr. Davis.*] It often happens, when tenders for building construction or engineering construction are invited, that the principals or their engineers ask you to take the risk of the ground which is to be excavated, and to give such a price as will cover any risk arising from the softness or hardness of the ground? Yes; I have built stores, for instance, where the foundations have been uncertain—where the foundation has been cut across with a line, and where we had to take the risk.

11968. Does it occur to you that the object of taking borings along a line of sewer—such borings as you have been looking at in connection with contract No. 69—would be to minimise, as far as possible, the risk which the contractor might have to take? Yes; of course, the more information the engineers can give to contractors the better.

11969. Do you not think that that is probably the reason why there are so many items to be found in the schedule? I do not think so.

11970. The open cutting work is different from tunnelling? Decidedly.

11971. So that you might have a variation there? Yes.

11972. And taking open cuttings by themselves, would it not be probable that in an open cutting such as you have seen in the section you have examined, there would be soft ground not requiring blasting and hard ground requiring blasting? Decidedly.

11973. Would not that be a very proper subdivision to make? The strata of the whole of the ground in the neighbourhood of Sydney are different. They change very much.

11974. Would you not be likely to find in an open cutting in the vicinity of, say, Marrickville, soft ground not requiring blasting and hard ground requiring blasting? Yes.

11975. So that the subdivision in the schedule would be a very proper subdivision to make? Yes; the bores put down give the contractors every information that they could possibly get.

11976. Your notice has been directed to the fact that Messrs. Carter, Gummow, & Co. had put in a uniform price in the case of each cutting—that is, 9d. a cubic yard for soft ground, and 9d. a cubic yard for rock? Yes.

11977. Would not the solution to that, both as regards open cuttings and also excavations for tunnels, be that Messrs. Carter, Gummow, & Co., instead of adopting the Department's idea of reducing the risk connected with work of that description, had thought it wise to take the risk of putting in a uniform price? No; I think not.

11978. Would it not occur to you that that might be the case? I should not imagine that anyone would think of doing such a thing. The usual practice is to take measurements, according to the nature of the ground, and I, for my part, would never think of guessing at a thing of that kind.

11979. But suppose that, rightly or wrongly, that has been done? I do not know how Messrs. Carter, Gummow, & Co. may have done it. All that I can say is, that I would not do such a thing myself.

11980. I do not think many persons would do so, but Messrs. Carter, Gummow, & Co. appear to have done so for some reason? Yes; at the same time I cannot account for it.

11981. As to the schedule disagreeing with the longitudinal sections, is it not a fact that the schedule attached to Contract 69 agrees with the longitudinal sections in every respect? It does not appear to do so. In the schedule of Contract 69, hard rock is mentioned; but there appears to be no hard rock shown upon the plan.

11982. First of all the schedule provides for excavation in open cutting and in tunnel, does it not? Yes.

11983. Do you see the words, "open cutting," occurring on the sections? Yes.

11984. And do you also see the word "tunnel"? Yes.

11985. Do you notice that "tunnel" is divided into two classes—tunnel in rock and "tunnels in more or less hard material"? Yes; I see that. It escaped my observation just now.

11986. Take the item "excavation in tunnels in more or less hard materials" for sewers, pipe sewers, subducts, &c.? Yes; I see that.

11987. Do you see that on the longitudinal section? Yes; the words, "more or less hard material," occur there.

11988. And does the schedule agree with the longitudinal section in that respect? Yes.

11989. Then, take the item, "excavation in tunnel in solid rock"? Yes; I see that also on the longitudinal sections. I did not see it at first. I only noticed "clay and iron band" before.

11990. You notice that there are a number of bores given in the longitudinal section, indicating the nature of the ground as far as possible at the position of those bores? Yes.

11991. You see that these bores in some instances are 5 or 6 chains apart, and in other cases they are closer? Yes.

11992. Do you not think that between these bores there is room for a variation of material such as you spoke of just now? I do not think so. It would not vary very much anyhow.

11993. Take, for instance, the bores on the Illawarra Road at 3 miles 24 chains, at 3 miles 30 chains;—do you not think there is sufficient distance between those bores to allow for a variation of the ground in the tunnelling? Look at the natural surface of the ground. I should not expect myself to find very much difference. The formation would lead me to suppose that there would not be much difference.

11994. But does not the ground in the neighbourhood of Sydney jump up and down in the most unaccountable way? Yes; in building I have found pockets of ironstone, and I have also found pipe-clay in the heart of rock, as it were.

11995. I suppose that those who have been actually engaged in the execution of this tunnel work would be likely to know whether the ground goes up and down? They would have more experience than I have in that matter. I have no experience in tunnelling.

11996. Does not shale differ very much? Yes; some is very close and some is open.

11997. And some is soft and some is hard? Yes.

11998. Coming now to your own prices for Contract 69, I would like you to say, in connection with item 21, "timber ordered to be left in the trenches as specified," whether you consider that your 6s. per cubic foot is a fair price? Yes; it would not have been there if we had not thought it a fair price. We went into these quantities upon our own knowledge, and nobody else's. We may be high, or we may be low, but that is our opinion.

11999. Take the 9-inch internal diameter subducts, item No. 25;—what do you say about that price? That is a fair price.

12000. Do you know what it includes? It includes the 9-inch pipes, I suppose. The office rate is only 6s. It would show that we tendered too high, I suppose.

12001.

- A. Dean. 12001. The schedule would show that Messrs. Carter, Gummow, & Co., in the case of that particular item, came absurdly low? Yes.
- 10 Aug., 1896. 12002. Then take your price for glazed stoneware pipes, 9-inch diameter, item 39? Yes; it is 5s. Your price is also 5s., singularly enough.
12003. How is it that there is such a difference between item 25 and item 39? I cannot tell.
12004. There is a marked difference in your prices, is there not? Yes.
12005. And apparently for the same work? Yes.
12006. *His Honor.*] Might it be that you take one item to include the excavation? I expect that is so. The subducts in hard rock would include the excavation.
12007. It is evident to you that you have included what was not specified, and, moreover, what was not included by the other contractors, looking at their prices? Yes.
12008. *Mr. Davis.*] Will you tell His Honor what you meant by your answer to Question 11,420 when you said that the amount would be £3,000 below Carter, Gummow, & Co. when the work was completed, and that you had not gone into the figures? My sons told me that they had gone into the matter. They told me that if they had taken the figures as Carter, Gummow, & Co. had done—that is, so many items at 9d., so many items at 4s., and so many items at 1d.—it would have brought down our estimate so much that we should have been £3,000 below Carter, Gummow, & Co.
12009. In other words, if you had tendered at Carter, Gummow, & Co.'s rates you would have been £3,000 less than they were? Yes.
12010. How can you explain that? I cannot say; my sons went into that matter.
12011. What you mean to say, in other words, is that if you had put in a different tender it would have come out differently? No; there is no meaning in that. What I mean is that if we had adopted the plan adopted by this firm our tender would have been much lower. I am giving you this information not from my own figures, but from what my sons have told me.
12012. *His Honor.*] That would be by lowering those items which look as if they were not intended to be carried out at all? Yes.
12013. *Mr. Davis.*] You said the other day that you did not like fatty sand? Yes.
12014. Had you in your mind the Bourke-street drift sand or crushed sandstone? Crushed sandstone.
12015. Have you used any? For mortar. It makes very fine mortar.
12016. Where did you get your crushed sandstone from? From the rock near the work.
12017. I suppose you would say that the sandstone of Sydney varies very much in character? Yes; of course some is much cleaner than others.
12018. Suppose you knew that tests had been made of crushed sandstone, and that in those tests, when compared with other tests made under precisely the same conditions with sand from the Nepean River, the crushed sandstone came out at the top, higher than the Nepean sand—would you say that that would prove that it was the better sand? I do not believe in those tests at all; I believe in actual work. I would rather have the tests of bricklayers or plasterers than all your scientific tests. I have no faith in them.
12019. I once heard of a man who said that he could tell the strength of cement by tasting it; do you believe in that? No. I do not wish to be taken as speaking disrespectfully of scientific tests. All I say is, that tests can be applied equally well in a practical way in connection with actual work.
12020. *His Honor.*] Do you not know that science after all is only practice put into a definite, clear, and regular, form? Exactly.
12021. *Mr. Davis.*] What you would be afraid of in connection with the crushed sandstone would be the shrinkage? Not only that, but the fatty nature of the sand kills the cement. It has a different effect upon the lime.
12022. Would you be afraid of the shrinkage? I should.
12023. When do you suppose that that would take place? I could not tell.
12024. It would take place in connection with the setting, or when? It might be a year or two before it would take place.
12025. Do you think that any shrinkage which would take place would occur within three years? I could not tell you. What I say is, that I would not use sandstone for cement, speaking from my own practice, because I know it to be of a fatty nature tending to kill the cement. In mortar it is a very good thing, because it enters the key very freely.
12026. Did you say that you agreed with Mr. McCreddie in his statement in connection with Contract 77? Yes. He sent me some prices and asked me if I thought them fair, and I said I did.
12027. What items did he send you? I really forget now.
12028. I am speaking of prices, not quantities? They were sent in to me, and I gave them to my son and asked him to compare them with our own rates. He did so, and said that the prices were very fair.
12029. You are not prepared to go into the details of those items? No.
12030. Perhaps your son will be able to do so? Yes.
12031. Have you been on to the work at Johnstone's Creek? No.
12032. *Mr. Carter.*] What did you understand by Mr. Parkes' question as to our being in the know? I said I could not tell.
12033. Suppose you took it to mean or to imply that Carter, Gummow, & Co. had had a large and varied experience in sewerage construction—do you not think as a contractor that they, with all their experience, extending over ten or twelve years, in nothing but sewerage works, would have an advantage over contractors like yourself who confine their operations almost exclusively to building construction? Decidedly; every man to his trade. With reference to the information afforded by the sections, and, speaking from a builder's point of view, what I mean to say is that if I were erecting a building under such conditions and were asked if I expected to find three or four different strata according to this plan, I should say that I did not, and that I expected to find nothing but one stratum all through the particular section to which I referred.
12034. But suppose these particular contractors, through their large experience, risked a little and plunged in their prices as it were? I should not like to do so.
12035. But your opinion would not govern the action of other persons? The opinion of a man who had had twenty or even fifty years experience might not deter another contractor from taking his quantities out at a guess.
12036. Suppose you call it taking a risk rather than guessing? I should not call it so.

12037. But that might be the case? I impute no motives; all I say is that I would not do such a thing. I do not believe in it. A. Dean.
12038. If a contractor's prices include only payments to him covering material and labour, do you not think that 10 per cent. is rather a low amount to put on for profit, supervision, plant, and everything else? I should be very glad to get it upon all my contracts, and I suppose I have carried out as many contracts as has any man living in this city. Brains and plant will enable one man to do a thing cheaper than it can be done by another man. One man may not have the ability, or having the ability he may not have the experience, and it may cost him more to carry out the work on that account. Of course, if a contractor happens to possess plant, it will enable him to tender for a job more cheaply than another contractor who perhaps has to buy the plant; or, if he has ability, he may be able to get work done more cheaply than it can be done by a man who has no brains. 10 Aug., 1896.
12039. *His Honor.*] Still you put in something, I suppose, for wear and tear of both plant and brains? Of course; but the possession of plant enables us to take a job more cheaply than we could take it for if we had to buy the plant.
12040. *Mr. Carter.*] Suppose the prices given to include the exact cost of labour and material, are we not supposed to get more than 10 per cent. in addition to that in cases where we have to find plant and supervision and take the risk? I should be quite satisfied with 10 per cent.

Benjamin Rhodes sworn and examined:—

12041. *Mr. Parkes.*] What is your calling? I am a contractor. B. Rhodes.
12042. Have you had much experience in contracting? Yes; I have had a great deal of experience in sewerage work—in fact, since I was 13 years of age. 10 Aug., 1896.
12043. What sewers have you built for the Government? We have constructed a great deal of work for the Water and Sewerage Board. We have undertaken contracts at Waverley, Woollahra, Redfern, and The Glebe.
12044. In connection with these sewerage contracts had you to fork the sandstone ballast? Yes; we had always to fork the sandstone. We had always to take the fine stuff out.
12045. Will you describe the method adopted by the Government inspectors and engineers in getting concrete made for these sewerage works? In the case of the Lewisham job—the first job we ever had under the sewerage construction (a storm-water sewer)—we had to fork the whole of the stone, and the fine stuff which came out of the stone we had to screen. For a while we were allowed to use a certain proportion of that with Nepean River sand.
12046. Sandstone in conjunction with Nepean River sand? Yes; but after some time we were stopped from doing that, although the sand was washed. We washed a lot of it, and one day Mr. Davis came on to the job and condemned the heap we had washed, and would not allow us to use any more crushed sandstone for that class of work. He said we must use nothing but Nepean River sand. We had a great deal of trouble over that matter, and were put about a good deal. I consider that we were dealt with rather unfairly, and I have kept a sample of the Nepean River sand which was condemned in connection with that work. It was condemned on account of its being rather fine. I thought it rather unfair that we should be allowed to use the crushed sandstone with the Nepean sand for some time, and that then the practice should have been suddenly stopped. There must have been something wrong about that.
12047. What I want to know is this—in the making of the concrete were you compelled to fork the sandstone? Yes.
12048. What portion were you allowed to use of the stone which was not forked? We used the forked portion and the residue we had to screen. We were allowed to use a certain proportion of that with the Nepean River sand.
12049. In the making of concrete have you ever tested the quantity of cement in the proportions of four two and one of bluestone concrete? Yes; bluestone concrete made with 1½-inch metal, and mixed in the proportion of four, two, and one, will give about 20 cubic feet for one cask.
12050. That is from your experience? Yes.
12051. And what will sandstone concrete in the proportions of five, two, and one, make? About 24 cubic feet.
12052. Have you ever used any of the seven, three, and two, concrete? No, I cannot say that I have.
12053. I suppose the Government inspectors are strict in seeing that you get a uniform proportion of cement through your work? Yes; they are very strict. From what I can hear we had two of the most strict inspectors in the Department sent on to our work directly we started. They were sent from a contract at North Shore—one of Carter, Gummow, & Co.'s contracts.
12054. Who were they? Reid and Harris.
12055. Did you ever have any conversation with either of them as to their coming to your work? No; not on that matter.
12056. What sort of man did you find Reid? He was a very strict man—very strict. A good man for the Department, no doubt. I consider that in that class of work there should always be a certain amount of give and take. Reid kept us strictly up to specification.
12057. Did he quarrel with your men? No; he was not a quarrelsome man. He was a very fair man in that respect.
12058. You tendered for Contract 77, did you not? Yes. I took a great deal of pains in going into that job. It was a job I should very much have liked to get, and I took extra trouble, going into the matter most minutely. I think it was only right that there should be absolutely fair fighting between contractors for a job of that kind. If the Department considered that a lump sum tender was necessary for a job of that description, then we, as well as the other contractors, had a right to put in a lump sum tender.
12059. Was there anything to preclude you from carrying out the work upon the Monier system? Nothing whatever.
12060. Did you expect that the Department would have called for tenders upon the Monier system if they wished it adopted? I thought there should have been a plan on the table for the work upon that system, so that we might have put in alternative tenders.

- B. Rhodes. 12061. Do you recollect the specification in Contract 77 sufficiently to say that it contained a clause providing for iron tie-rods in the concrete wired together? Yes; I do remember that. There were some tie-rods to be used in the sewer itself. There were no tie-bars or anything of that kind in the arch work.
- 10 Aug., 1896. 12062. But there were in the carrier? Yes.
12063. If any ordinary contractor could put that work in, could he not put in the Monier work? Certainly.
12064. Do you know of anything which would preclude an ordinary contractor from carrying out the Monier system? No; I do not.
12065. Have you, since this contract was let to Carter, Gummow, & Co., had a look into the quantities of the Monier plan and prices? I had a look at the quantities.
12066. And you have priced them? Yes; for instance, take the 3 to 1 compo. I consider that the material and labour of the 3 to 1 compo. would be worth £1 6s. 7d. per cubic yard. There would be two casks of cement at 9s. 6d.; 24 ft. of sand at 3s. 6d.; the labour in mixing and watering, 1s.; and the placing in position, 3s. 6d.; making a total of £1 6s. 7d. for the compo. Then the special 5, 3, and 2 concrete comes out as follows:—1 cask of cement, 9s. 6d.; 10 ft. of metal, at 11s. 6d. per yard, 4s. 4d.; 6 ft. of sand, at 3s. 6d., 9d.; or a total of 14s. 7d.—or say £1 7s. per yard. I allow for the labour in mixing 2s. 6d., and for the placing in position 3s. 6d., making a total of £1 13s. The ironwork would be worth about 6s. a cubic yard and the centering 3s., bringing the total up to 43s.
12067. If you were tendering is that the price you would submit? I should be perfectly willing to construct the work at that price.
12068. Would you be bound in a full value penal bond for the construction of the work at that price? Yes; certainly.
12069. You would have been willing to take the risk at that price? Yes.
12070. So that there would have been nothing at all to preclude you from tendering if you had had the opportunity? Nothing whatever.
12071. In the making of the concrete is it not a good thing to have the stone so proportioned as to allow of about an  $\frac{1}{8}$ th joint between different particles of the stone? Yes; it is a very good plan for binding purposes.
12072. What would be the effect of a joint as fine as a piece of paper? That would be rather too fine.
12073. Is flat stone a good thing for the making of concrete? No; I would rather have it rough; the rougher the better for the concrete.
12074. In what shape? Angular in shape would be best.
12075. In pretty uniform bulk? Yes.
12076. You were one of the contractors who waited upon me with some complaint? I was one of four who waited upon you one day. I went to see you simply on account of what seemed to me very unfair treatment. I thought we ought to be put on the same footing as other contractors, who, I thought, were getting an undue preference.
12077. Take Contract 79; was my attention called to the manner in which the substitution of blasting for guttering and gadding had been made;—was that one of the things pointed out to me? I do not recollect it.
12078. *His Honor.*] Do you remember the schedule being produced? No.
12079. *Mr. Parkes.*] Was any complaint made to me with regard to the letting of Contract 79A without tender? Yes; that was very much spoken of.
12080. Do you recollect my attention being drawn to a certain item in that schedule in connection with excavation work? No; I do not recollect that.
12081. The schedule was not produced; but do you not recollect the statement being made as to a certain item in the schedule? I do not recollect anything about that.
12082. *Mr. Davis.*] Who was with you on the occasion when you went to see Mr. Parkes? On the first occasion, Mr. Williams, Mr. Butcher, and Mr. Ewing.
12083. On how many days did you see Mr. Parkes? I saw him twice.
12084. On the second occasion who was there? Mr. Gilliver was with us then.
12085. Who else in addition? Mr. Williams, Mr. Ewing, and Mr. Maddison, if I remember rightly.
12086. What took place on the first occasion? I met Mr. Williams, and he spoke to me on the matter. We talked the thing over, and we thought it advisable to see Mr. Parkes in reference to the manner in which Carter, Gummow, & Co. got Contract 77. That was the principal reason of our going to him. I considered that we had a perfect right to put in a tender at a lump sum as well as had Carter, Gummow, & Co.
12087. Did Mr. Williams suggest that you should go and see Mr. Parkes? Yes; he and I talked the matter over, and we thought it advisable to see Mr. Parkes.
12088. Mr. Williams is acting as general organiser to you contractors? No.
12089. Have you seen Mr. Parkes more than twice? I have seen Mr. Parkes twice during the inquiry—that is two days on which I have been sent for. I saw him one day last week.
12090. What occurred on the second occasion, when you waited upon him as a deputation? Nothing in particular transpired. We talked over several matters in connection with contracts.
12091. But nothing in particular was said? No.
12092. Your grievance seems to have been that you were not allowed a fair show at the tender-box, as you think, in connection with the letting of Contract 77? Yes; I was very much dissatisfied with that.
12093. As far as the tendering for the departmental design is concerned, I suppose you have no reason to complain about that? No.
12094. What was your tender? Thirteen per cent. below schedule.
12095. How did you rank in the number? I suppose we ranked seventh or eighth on the list.
12096. So that you were quite out of it? Yes; certainly. At the same time, I thought when I was tendering for it that it was a most elaborate design. I thought, somehow, that it would never be carried out. It is a funny coincidence that I made that remark to my partner. I told him I thought the design would never be carried out.
12097. *His Honor.*] Why was that? I thought it rather an elaborate design for a sewer.
12098. Too ornamental do you mean? Rather too ornamental—too costly.
12099. *Mr. Davis.*] Did you think Messrs. Carter, Gummow, & Co.'s price was very high considering the class of work they had to do? No; I thought 28½ per cent. off was a very low price.

12100. Do you think Mr. McSweeney should know anything about work? He should do so; he has carried out a lot of it. B. Rhodes.
12101. In view of the fact that Mr. McSweeney is only 3 per cent. above Carter, Gummow, & Co.'s price, what would you say? 3 per cent. makes very little difference. 10 Aug., 1896.
12102. What do you think of your own tender? I should like to have got the job at that price.
12103. Assuming that the Monier structure, according to Carter, Gummow, & Co.'s tender, is of the same value as the departmental proposal, would you not have been proportionately higher in your tender for the Monier work;—is not that probable? No; I do not think so.
12104. You would have been specially low for the Monier design, you think, if you had had a chance to construct it? Yes.
12105. That accounts for your price of 43s. per cubic yard? Yes.
12106. You think that is a low price? No; I do not think it is a low price. It is a fair working price.
12107. Would it be at all on the same lines as your tender for the departmental design? Yes.
12108. About in proportion? Yes.
12109. As to the sandstone concrete, did you use crushed sandstone when you made concrete at Lewisham? Yes; and Nepean River sand.
12110. Was it not at your request that the forking was done? No; we were compelled to fork it.
12111. On account of what was that? The inspectors compelled us to fork the stone.
12112. Were they doing anything outside of the specification? I do not think they could have compelled us under the specification; but, of course, if we had objected to it we might have been compelled to screen it, which would have been more costly.
12113. In other words, it was cheaper to fork the stone than to screen it? It was a little cheaper. Of course, in this case, there was screening to some extent after the forking.
12114. It paid you to screen it to get sand for use on the contract? Yes. The fine stuff being much cheaper than Nepean River sand.
12115. The sandstone you have spoken of was broken on the ground in heaps? Yes.
12116. It was broken on clayey ground, was it not? Yes; on good hard ground, principally.
12117. After the sand had been broken, and when it was forked up into the gauge-box, there would be left behind a quantity of sand and small stuff, would there not? Yes.
12118. Would that small stuff not be mixed to some extent with material from the ground on which the stone had been broken? It would, certainly.
12119. Was not that the reason why its use was objected to? No.
12120. Are you in a position to say that? Yes. I am perfectly satisfied that that sand was equally as good as the sand that we are using at the present time.
12121. And are you in a position to say that the reason I have mentioned is the reason why the sand was condemned? It is a funny thing that after it had been washed, and after it had been in use for some time, it should have been condemned.
12122. But can you say that that was not the reason why it was condemned? I am perfectly satisfied that it was not condemned on that account.
12123. Have you carried out much bluestone concrete? A considerable extent of it, especially in man-holes.
12124. In small man-holes? Yes.
12125. What sort of stone have you used? One and a half inch metal.
12126. Where was it obtained from? Principally from Fuller & Co.
12127. Was it hand-broken or machine-broken? Machine-broken.
12128. What shape was it—was it flaky or angular? It was inclined to be flaky.
12129. So that the metal which Mr. Parkes asked you about just now you have actually used? Yes.
12130. It is a general practice to use it? Yes; ordinary 1½-inch metal, broken in a machine.
12131. It is very flaky as a rule? Yes.
12132. Very fine? Of course, you get a lot of fine stuff with it. It pays the contractors to get all the fine stuff they can. It is disallowed, I know.
12133. Why? Because it would be more bulky after being mixed—the fine stuff being mixed with the coarse stone.
12134. It makes more concrete? Yes.
12135. Have you read the specification as to the bluestone to be used in concrete? Yes.
12136. What impression have you as to the intent of the specification with regard to the size of stone that is to be used? It is supposed to be 1½-inch blue-metal, gauged in the proportions of 4, 2, and 1.
12137. Has anyone ever objected to your using stone below 1½-inch, provided there was no dust in it? It has been objected to.
12138. By whom? By Inspector Coulson principally.
12139. In any work I have had to do with have you ever found it objected to? No; I have used very little concrete under you in the way of bluestone concrete. It has been principally sandstone concrete.
12140. You said just now to Mr. Parkes that you did not think the other contractors, as compared with Carter, Gummow, & Co., had been treated properly;—you said you thought that undue preference had been given to Carter, Gummow, & Co.? Yes.
12141. Upon what grounds do you say that? On the ground of their tender being accepted for Contract 77 for the construction of the work on the Monier system.
12142. Have you any other ground? Yes; I do not think it is fair that they should have got the North Shore job without tenders being called. I refer to the extension of Contract 79A.
12143. You thought they should not have got that work; but suppose the Minister of the day, who had the matter in his hands, thought differently from you—suppose he thought they had a perfect right to it? I suppose he had a right to please himself. He had the power in his hands. Of course, I was dissatisfied.
12144. *His Honor.*] What is the reason you object to the screening? Because the forking was cheaper.
12145. How comes the forking to be cheaper than the screening? In forking the metal you just run the fork in under the heap of metal. If you have to cart it you throw it into a cart. If your gauging-board is sufficiently near you fork it off the heap into the gauge-box.
12146. It is the labour that is saved in forking? Yes.

- B. Rhodes. 12147. You save the metal in screening and the labour in forking? Yes. We were using Nepean sand, and it did not make much difference to us. We were not allowed to use more than a certain proportion of screening from the stone in the gauge box with the Nepean River sand, and I thought it unfair that we should have been allowed to use the screening and Nepean River sand for a lot of the work, and should suddenly have been prevented from doing so.
- 10 Aug., 1896. 12148. Your screening would make a good deal of stuff useless to you? Yes.
12149. You would get a good deal more stuff from the screening than you would be allowed to use? Yes.
12150. So that you would have no object in screening for that purpose? No.
12151. Still it would save the stone in the concrete, and give you better bulking? Yes.
12152. Labour however, came in as an element, making it cheaper on the whole to fork? Yes.
12153. *Mr. Davis.*] As to your price of 43s. per cubic yard for compo., have you had any experience to guide you in arriving at that conclusion as to the value of the work? I have had a good deal of experience in concrete, in different proportions of concrete, and it does not make a great deal of difference.
12154. You think there is very little difference between the work which is being carried out on the Monier system at Johnstone's Creek and ordinary concrete work? There is a little difference.
12155. On that basis you arrive at the conclusion that the work is worth 43s. per cubic yard? Yes.
12156. *His Honor.*] You have produced to-day a sample of the Nepean sand which you say was condemned? Yes.
12157. You say that that was rejected by Mr. Davis? Yes.
12158. On what grounds? Because it was considered rather fine.
12159. *Mr. Davis.*] As a matter of fact two qualities of Nepean sand are provided, are they not? I think they are.
12160. They are at different rates, are they not? Even if they are, I am under the impression that we paid the higher rate, but my partner would be better able than I am to give you particulars as to that.
12161. At any rate the sand specified in the sewerage specifications is the best Nepean sand? Nepean sand or sand equal to it as per sample in the office.
12162. That sample is the best Nepean sand? Yes.
12163. But there is another quality beside that? I know that we were paying for the best.
12164. *His Honor.*] Perhaps you were not getting it? Perhaps it was not quite as coarse as the sand in the office, but I am quite prepared to say that Nepean River sand is far before the crushed sandstone which we are using at the present time. It may be a little bit detrimental to me to say so. I remember making the remark to my foreman upon the work that if I were an engineer I would not allow that fine stuff out of the stone to be used in with the Nepean River sand.
12165. What are you using crushed sandstone in now? In the contract we are doing at Double Bay under Mr. Davis.
12166. Is there concrete work there? Yes; it is principally pipe-lying. There is concrete round the pipes and there are concrete manholes.
12167. How long have you been allowed to use crushed sandstone there? We have been allowed to use it since we started.
12168. When did you start? About 8 months ago.
12169. Who is in charge of the contract—who is supervising it for the Government? Mr. Davis.
12170. So that he seems to pin his faith to crushed sandstone, as far as you are concerned? Yes; he has been perfectly satisfied up to date.
12171. Did you request to be allowed to use crushed sandstone, or how did you come to use it on that job? Because the other contractors had been using it.
12172. Did you ask leave to be allowed to use it? No. I had a sample sent to the office which passed the required test.
12173. And you went on using it without any objection? Yes.
12174. *Mr. Davis.*] You requested that the sample should be sent? I do not remember that. I think I sent a sample without being asked.
12175. *His Honor.*] Where does the stone come from? From North Shore.
12176. And some of it is considered good? Yes. It is considered very good. Some of it is, of course, inferior to the other; there is no doubt about that. No doubt there is good stone there. If you could get first-class sandstone it would compare favourably with the Nepean River sand.
12177. You do not know whether the sand from this stone has actually passed a better test than the Nepean River sand? No, I do not.
12178. *Mr. Carter.*] Where do you get the crushed sandstone from at North Shore? That I could not tell you.
12179. I ask you because in your estimate for compo. this morning you allow 3s. 6d. per yard for sand? Yes. That would be 1s. less than we are paying—4s. 6d. Knowing you had a crushing machine at Annandale I made my estimate accordingly.
12180. I may tell you that our sand comes from North Shore, three miles further off than does your sand. Do you think that, under those circumstances, 3s. 6d. would be a fair valuation? No; I should think 4s. 6d. would be a fair valuation.
12181. Supposing we pay 5s.? Of course, I was under the impression that you were using some of the stone that came out of your tunnel; I thought you were crushing a lot of that stone out at Annandale.
12182. If we had the stone given to us for nothing it would not be fair for you to take that into consideration in valuing the work. You would have to take the market rates in making your valuation. You must not take the rates which we as individuals are paying. You must take the market rates 12 months ago? We will call it 4s. 6d.; I will put on the extra shilling.
12183. Referring to the Monier system, do you know as a matter of fact whether we had a patent for that system? The specification distinctly states that if there is any patent in the contract the contractor must pay the royalty on that patent.
12184. Were you prepared to pay the royalty, and do the work for the price you have mentioned? Yes.
12185. Do you know what the royalty is? From what I have heard I think it is 15 per cent. on the iron-work.
12186. Referring to the putting in of a lump sum tender, had you not as much liberty to put in a lump sum tender as we had? There was nothing in the specification as to that.

12187. But there was nothing to prevent you from putting in a lump sum tender had you chosen to do so? I think it would have been against the rules and regulations of the Tender Board. I know I thought so at that time.

B. Rhodes.

10 Aug., 1896.

12188. Are their any rules bearing upon that point—to what rule do you refer? I mean the rules for the system of tendering upon schedule rates. I do not know of anyone else doing what you refer to. I know that you also put in a lump sum tender for the Manly contract, and that it was not accepted.

12189. Our lump sum tender in that case you say was not accepted, so that there must have been some special reason for the acceptance of our lump sum tender in the case of the Balmain contract? Yes.

12190. *Mr. Parkes.*] In answer to Mr. Davis you said, as to the concrete in No. 77, that you took it as ordinary concrete—7, 3, and 2? What I thought I said was that it was similar work.

12191. The concrete used is 5, 3, and 2; would that be superior to 7, 3, and 2? Yes; I should think it was.

12192. What makes it superior? There would be less stone in it.

12193. And more cement? Yes; more binding power.

12194. That is what makes it superior? Yes.

12195. It is not by crowding in stone that you make concrete stronger? No.

Samuel Butcher, sworn and examined :—

12196. *Mr. Parkes.*] What is your occupation? I am a contractor.

S. Butcher.

12197. Have you carried out any sewerage works? I have carried out a good many of those works for the Water and Sewerage Board, but I have not done much of it for the Public Works Department.

10 Aug., 1896.

12198. Have you done much concrete work? Yes, for the Water and Sewerage Board, for manholes, &c.

12199. As to the bluestone concrete 4, 2, and 1—that is a Water and Sewerage Board specification, is it not? Yes.

12200. How much cement goes to a yard in that case? About a cask and a third to the cubic yard.

12201. Have you ever measured up sandstone concrete to see what it will go? A cask will go to about 24 feet.

12202. In mixing that concrete, do you use a fork to lift the metal? Yes; that is customary.

12203. Is it a regulation of the Department that the metal must be forked? Yes; we always do that.

12204. Do the Inspectors make you fork it? Yes.

12205. Have you ever done any work lately under the Department? Yes; I have a contract at Blue's Point—No. 122. Previous to that I have carried out a pipe contract for the Department.

12206. Of what does Contract 122 consist? It is mostly tunnel work—bluestone concrete and brickwork.

12207. In that case are you made to fork? I have not started the concrete yet. I am not ready for it yet.

12208. Which makes the most adhesive concrete—that which has a fair joint of cement running through it or that which has a thin joint of cement in the interstices? I should think the cement with the thicker joint.

12209. The concrete has to rely upon the cement? Yes.

12210. *Mr. Davis.*] Did you wait upon Mr. Parkes? Yes; I was one of those who waited upon him as a deputation in the interests of contractors to try to prevent the letting of contracts privately without calling for tenders, and also the granting of concessions to certain firms.

12211. What were the contracts privately let to which you referred? There were three extensions at North Shore let to Carter, Gummow, & Co. without tendering, at a cost of £16,000 or £17,000. These extensions have been completed some months ago, and the work cannot be utilised for some time to come. We thought it unjust that contracts should be let in that manner.

12212. What other contracts had you in your mind? That is all, with the exception of Contract 77, which was tendered for at schedule rates, and was let to Carter, Gummow, & Co. upon their lump sum tender.

12213. That you objected to? Yes.

12214. I suppose you would grant that even while the contractors are entitled to fair play and justice the Minister would be supreme in all such matters? I cannot answer that.

12215. With regard to the thick joints in between the stones in concrete—what would you say the thickness of a joint should be;—have you any very decided opinion as to whether there should be much or little? No.

12216. You have not gone into that subject from a scientific standpoint? No.

12217. Has the sandstone you have used been knapped stone? Yes; broken with a hammer.

12218. And you say the fork has been used by regulation? Yes.

12219. Where do you find the regulation? In the specification.

12220. Which specification? They always order it to be forked in lieu of screening.

12221. But what specification are you referring to? The Water and Sewerage Board's specification.

12222. You do not know whether in connection with Contract 122 any forking is specified there? I have not noticed it. It is all bluestone concrete on that contract.

12223. Is there not a clause as to the elimination of sand, as in all other contracts? I believe there is; but I have not noticed it.

George M'Credie, recalled and further examined :—

12224. *Mr. Parkes.*] I believe you wish to make some alterations in your former evidence in which you described how you made your tests for your brickwork, and referred to the quantity of cement going into it;—I believe you wish to illustrate what you then said? Yes. On 31st July, Mr. Davis asked me some questions as to the size of the bricks. You will see the matter to which I refer at Question 10,459. On reading the evidence after it had been handed to me for revision, I thought I had, perhaps, made a mistake, but on getting the bricks I find that that is not so. I have brought you some bricks to-day which were used in our tests, and you will be able to see the exact size of them, so that there may be no mistake.

G. M'Credie.

10 Aug., 1896.

12225. *Mr. Davis.*] Did you select the bricks? They are taken out of the stack we tested.

12226. But did you select these bricks specially? No.

12227. They are a fair sample of the bricks you used? Yes; they measure 9 inches long, and they are barely  $4\frac{1}{4}$  inches wide. I remember your asking me how closely we put the two bricks together in the 9-inch

G. M'Crede. 9-inch work, and you implied that there would be an inch joint. As a matter of fact, the bricks were only  $4\frac{1}{4}$  inches. I produce to-day some of the bricks we used in the wall test, and also some of the bricks we used in the arch test. You will notice that in the bricks used in the arch there is no frog. They are rough, wire-cut bricks. We found that it took half a cask to do a yard in the arch, and in the wall we found that it took more.

12228. *Mr. Parkes.*] Where the bricks are specially radiated, the joint would be smaller? The joint would be a little smaller.

12229. The other day you inadvertently said 4 inches instead of  $4\frac{1}{4}$  inches? Yes.

12230. *Mr. Davis.*] That would allow for a collar-joint? It allows for what you call a collar-joint in 9-inch work.

12231. You have therefore allowed for a collar-joint? There is a clause in the specification which says:—

112. Wherever concrete is to be built on to and against brickwork, or brickwork on to and against concrete, the latter in each case to be well wetted and grouted, and then to be covered with a coat of cement mortar, collar-joint,  $\frac{1}{2}$  inch thick, before the concrete or brickwork is built against it.

113. Prior to commencing any concrete or brickwork which has to be built on to and against rock faces, all shaken and loose rock to be removed, all rock surfaces to be well cleaned, washed, and wetted, and all beds, open joints, and spaces between concrete or brickwork and rock faces, to be carefully filled in with cement mortar, and flushed and grouted every course as the brickwork proceeds; and the cost of thus preparing rock faces, washing, grouting, flushing, &c., to be included in, and covered by, the Schedule price per cube yard for the concrete and brickwork herein referred to.

Clause 11 also says:—

11. Bricks to be double-pressed, of well-mixed material of approved quality and uniform fineness; to be new, sound, hard, and well-burnt, kiln bricks, free from cracks and all other defects, equal in every respect to the sample brick to be seen at the Engineer's office. They are to have sharp arrises, and to be of approved dimensions, form, and colour, and, when ordered, to be specially moulded. Radiating and specially-formed bricks to be provided for all segmental shafts. All bricks to be subjected to the following tests:—

(a) *Tensile strength.*—The tensile strength to be tested, in the departmental testing machine, by laying the brick horizontally on its base of 3 inches, between supports 7 inches apart, and the strain applied across the centre of the brick. An average breaking strain of twelve bricks to be taken, which must not be less than 8,000 lb.

(b) *Porosity.*—Bricks immersed in water for twenty-four hours must not increase in weight more than 3 per cent.

Should the twelve bricks fracture under the foregoing average strain, or prove more porous than 3 per cent., then the Engineer may reject the whole stack of bricks from which the twelve bricks were taken.

12232. *Mr. Parkes.*] You have made further tests of what concrete will consume in the way of cement, if carried out entirely with all the small stone and everything in, in relation to the contracts which have been referred to? Yes.

12233. Will you read your report? Yes; it is as follows:—

Dear Sir,

250, Pitt-street, Sydney, 10 August, 1896.

As requested by you, we have made a further test of the sandstone and bluestone concrete as specified by the Sewerage Construction Department, dispensing this time with the use of the fork.

The ballast in each case was shovelled from the large heaps upon which it had been knapped, and placed upon an eighth of an inch screen. There it was washed, and all that did not pass through the screen was shovelled into the gauge-box. We followed the same method of testing as previously described in our report of the 23rd ult., and the ballast contained a very large proportion of stone the size of a pea.

The results were as follows:—

*First*—Sandstone concrete. Proportions specified—1 cement, 2 sand, 5 stone. The sand and cement entirely disappeared in the sandstone, showing that it would require 1.35 casks of cement for each cubic yard of concrete, as we previously reported.

*Second*—Bluestone concrete. Proportions specified—1 cement, 2 sand, 4 stone. This showed a slight increase in bulk, amounting to one-twenty-fourth, or equal to 1.6172 casks of cement per cubic yard.

Providing that the Department did not insist on having the ballast forked, and allowed the concrete to be made as we have done in this test, the deduction of cement would be 553 casks in Contracts 69, 79, and 79A, and ten casks in the remaining contracts.

We may say that these tests were, as in the former instances, made in the presence of Messrs. A. L. M'Crede and Geo. Donald.

We are, &c.,

GEORGE M'CREDE,  
W. THOMPSON.

Varney Parkes, Esq., M.L.A., Public Works Inquiry Commission.

I should like to point out that Mr. Davis asked me the other day where I got the description of the 7, 3, and 2 concrete. I find in looking up the papers that it came out of Contract 77. The clause is as follows:—

#### 11. Concrete Work.

The concrete to be used in foundations of all piers, and in all piers and abutment piers, for the 12-foot, 33-foot, 48-foot, and 57-foot, span arches up to level of springing and top of plinths, in haunches and spandrels, between and over all arches between external brick-facings, up to level of underside of string-course (6 inches below invert of sewer), in retaining walls along road deviations and roads, round storm-water discharge pipes, round stoneware pipe where directed, and where ordered in any situation in the construction of these works, to be sandstone concrete of the quality specified in clause 142 of the schedule to specification.

The concrete to be used in inner sewer lining (between brick facings) of aqueducts to be special bluestone concrete of the quality specified in clause 141 of the schedule to specification, except that in this instance the bluestone metal to be broken to a size to pass freely with its largest dimensions through a ring of  $\frac{3}{4}$  inch in diameter, to be screened and washed as specified in clause 140 of the schedule to specification.

The concrete to be used in lining sewers in tunnels, open cuttings, in ventilating shafts, drops, weir-chambers, inlets, flushing, gas-check, and other gas-chambers, and where ordered in the construction of these works to be bluestone concrete of the quality specified in clause 140 of the schedule to specification. The whole of the concrete work comprised in this contract to be commenced, executed, and completed (including the iron bond-rods in concrete lining of sewer on lines of aqueducts as described in clause 164 of the schedule to specification), as shown on drawings, and as specified in the schedule to specification in clauses 140 to 171.

12234. Will you now turn to clause 164 of Contract 77? Yes. It is as follows:—

In conjunction with the concrete surrounding sewer, where the latter is built upon arches and in embankments, the contractor to provide, fit, place in position, and wall in with the concrete longitudinally, in each corner at top and bottom of concrete lining  $\frac{3}{8}$ -inch diameter bond-rods in 16-foot lengths. The ends to overlap 12 inches, and tied together with binding-wire, and, transversely,  $\frac{3}{8}$ -inch diameter bond-rods  $4\frac{1}{2}$  inches above soffit of sewer of such lengths as to fit between the outer brick lining, or as shall be directed, spaced 10 feet from centre to centre. The cost of providing, fitting, placing, and walling-in, said bond-rods to be included in the schedule price per cubic yard of concrete.

12235. Is that clause not similar to the clause in Contract 112 dealing with the bond iron? It appears to be the same.

12236. If that work were presumed to be effectual in Contract 112, would it not be effectual in Contract 77? I should think so.

12237. You have not before seen the clause in the specification which you have just read? No; I saw it G. M'Creddie for the first time on Saturday.
12238. Therefore, you did not include that in your prices of the departmental design? No; it is not a very expensive item. It seems to me to be the Monier system pure and simple. The Monier system does not consist of the distance between the rods, but relates to the method of fixing them.
12239. As to the concrete, what was the object of putting special concrete 5, 3, and 2, in these aqueducts in Contract 77? I could not tell you.
12240. Is 5, 3, and 2, a superior concrete to 7, 3, and 2? I could not tell you unless I went into the matter.
12241. Surely your knowledge of concrete ought to instruct you to that extent? It depends upon what you are going to use it for.
12242. Is it superior or inferior concrete to 7, 3, and 2? It ought to be better concrete.
12243. Have you observed the carrier of Contract 77? Yes.
12244. Is there in it any association of small sandstone ballast with the bluestone? There is a small quantity of sandstone. You can see the sandstone inside the carrier associated with the bluestone.
12245. Showing on the surface? Yes.
12246. Is that work fairly open and irregular on the face? Yes. Before it is rendered.
12247. Its efficiency has to rely upon the rendering? Yes. Of course, the rendering would go well into that surface.
12248. *His Honor.*] Do I understand you to say that the irregularity of the surface is an improvement? It is no detriment. It makes the rendering hold on to it.
12249. It gives a better bond? Yes.
12250. *Mr. Parkes.*] Do not some of these inequalities penetrate almost through the whole mass of stuff? Well, the iron shows through on the top. It does not seem to go in as closely as it might do. You can see little particles of metal up against the iron. It will want well grouting when it is rendered.
12251. The iron shows occasionally? Yes, but only at the top of the carrier. It may be that, if it is very carefully rendered, the rendering will go right in round the iron.
12252. *His Honor.*] The rendering will be better than the original substance of the concrete itself—it will be a richer material? Yes.
12253. *Mr. Davis.*] You have told us each time you have been here that you are satisfied with the results which you have obtained from the experiments you have made and with the figures you have put before the Commission;—are you satisfied on this occasion? Yes.
12254. It does not strike you that your being satisfied this time is rather inconsistent with the satisfaction which you have expressed previously? I do not understand what you are trying to get at. I want it to be understood that in dealing with these matters which have been brought before the Commission I have come here to tell the Commission exactly what I find. Mr. Davis is apparently endeavouring to lead me up to give some answer which may mislead the Commission; but I have come here simply to tell the truth; I have nothing to hide; I am here only to do my duty, and I consider that I have done it. If Mr. Davis has any straight question to ask me, I will give him a straight answer.
12255. *His Honor.*] As far as the comparison of 5, 3, and 2, and 7, 3, and 2, concrete goes, I suppose you would put it in this way: That 7, 3, and 2, would be as strong a piece of concrete, if properly mixed, but that 5, 3, and 2, would probably have better adhesive power to the iron, because of there being less likelihood of metal in immediate contact with the iron than would be the case with the 7, 3, and 2, mixture? Yes.
12256. There would be less chance of its non-adhesion from pieces of stone coming straight in contact with the iron bars? Yes.

William Thompson recalled and further examined:—

12257. *Mr. Parkes.*] In conjunction with Mr. M'Creddie, you have made further tests as to the quantity of cement which would go into the various concretes? Yes.
12258. Will you describe to His Honor the effect of your tests? I have already made a report upon the subject, which I understand Mr. M'Creddie has read.
12259. You endorse that report? Yes.
12260. You did not, in connection with Contract 77, take into your estimate of the cost of the original departmental plan the ironwork which is provided for in the specification, and which missed your attention? No.
12261. I believe the specification provides for ironwork similar in its nature to that provided for in the specification of Contract 112? Somewhat similar.
12262. You have nothing upon which you desire to comment in connection with your concrete tests? No.
12263. Do you wish to in any way alter your evidence as to the rest of the cement tests you have made? No; only as indicated by our report.
12264. The object of your making the alteration to which you now refer was to keep literally to the meaning of the specification? Yes; using the screen instead of the fork.
12265. Not that it makes a great deal of difference? No; especially in the sandstone concrete.
12266. You yourself know very little about concrete? No; I do not profess to know much about it.
12267. You are a quantity surveyor? Yes.
12268. In carrying out your profession it is necessary that you should have an understanding from day to day of market values? Yes; I suppose I price a job twice a week at the very least, sometimes daily.

W.  
Thompson.  
10 Aug., 1896.

WEDNESDAY, 12 AUGUST, 1896.

William Thompson recalled and further examined:—

12269. *Mr. Parkes.*] Have you prepared a return showing the items upon which Carter, Gummow, & Co. are paid in connection with Contract 69? Yes. [*Vide Appendix, No. 43.*]
12270. Will you read the numbers of the items upon which they were paid at the completion of the work? Yes. The items are 1, 8, 11, 12, 14, 16, 19, 20, 21, 22, 28, 29, 30, 31, 32, 33, 34, 35, 36, 38, 39, 40, 41, 42, 43, 45 to 82, 83, 84, 85, 86, 95, 96, 97, 99, and 100.

W.  
Thompson.  
12 Aug., 1896.  
12271

W.  
Thompson.  
12 Aug., 1896.

12271. You have seen in the Parliamentary papers a return showing the tenders of the various contractors and the details of the prices which they have affixed to the quantities supplied by the Government? Yes.
12272. And upon that you have made a calculation showing what the prices paid on the completion of the contract were, including the extra quantities; showing also what would have been the position of the various contractors if they had been instructed by the Department to construct the work upon the particular items upon which Carter, Gummow, & Co. were paid? The return I have made shows the relative amounts of the various tenders received, based upon the quantities actually paid for. [*Vide Appendix, No. 48.*]
12273. Will you give the totals of the various contractors, taking Carter, Gummow, & Co.'s total first? Yes. Their total was £54,320 7s. 7d.; Ahearne's was £48,002 8s. 8d.; Kerle and Kerle's, £56,998 15s. 10d.; M'Kenzie's, £51,494 9s. 2d.; M'Sweeney's, £59,376 1s. 9d.; Holloway Bros., £54,823 12s. 2d.; Carson's, £55,489 5s. 5d.; Dean's, £57,456 19s. 7d.; Langtry and Owen's, £66,579 12s. 11d.; Parry and Farley's, £66,913 14s. 2d.; Stewart's, £75,570 5s. 10d.
12274. Will you read the amounts of the tenders originally sent in by these contractors? Yes. Carter, Gummow, & Co.'s tender was £45,207 8s. 11d.; John Ahearne's was £47,061 3s. 9d.; Kerle and Kerle's, £52,735 10s. 9d.; M'Kenzie and Sons' was £53,505 2s. 7d.; M'Sweeney's, £54,623 18s. 2d.; Holloway Bros., £55,104 8s. 9d.; Carson's, £57,239 0s. 9d.; A. Dean and Son's, £58,165 10s. 8d.; Langtry and Owen's, £59,676 16s.; Parry and Farley's, £63,095 11s. 11d.; J. Stewart & Co.'s, £68,171 6s. 9d.
12275. Take John Ahearne's tender;—what is that tender, taking the original items, in excess of Carter, Gummow, & Co.? £1,853 14s. 10d.
12276. If John Ahearne had worked upon the schedule selected for Messrs. Carter, Gummow, & Co., how much less would the amount have been? £6,317 18s. 11d.
12277. That is, on the final voucher? Yes.
12278. What are the particulars as to other contractors in a similar relation? Kerle and Kerle, who stood third, would actually have been higher than Messrs. Carter, Gummow, & Co.; M'Kenzie would have been less.
12279. Would Kerle and Kerle's tender have been reduced? No; it would have been £4,263 5s. 1d. over. M'Kenzie's tender would have been reduced by £2,010 13s. 5d.
12280. And M'Sweeney's? He would have been increased by £4,752 3s. 7d.
12281. And Holloway Bros.? That would have been reduced by £280 16s. 7d.
12282. What about Carson's? That would have been reduced by £1,749 15s. 4d.
12283. And Dean's? That would have been reduced by £708 11s. 1d.
12284. The others would have been increased? Three would have been increased.
12285. How many contractors, upon the schedule selected for Messrs. Carter, Gummow, & Co., would have been below on the completion of the work? Two of them—Ahearne and M'Kenzie.
12286. Have you prepared a sheet showing the items upon which Messrs. Carter, Gummow, & Co. were not required to work—that is, the items which are eliminated; and does that return show the relation of the items eliminated to the tenders of the other contractors? Yes; the return gives a list of the items omitted, priced out at the respective schedule rates. [*Vide Appendix, No. 49.*]
12287. Will you read the numbers of those items? 2, 3, 4, 5, 6, 7, 13, 15, 17, 18, 23, 24, 25, 26, 27, 37, 44, 87, 88, 89, 90, 91, 92, 93, 94.
12288. Will you give the relation between the price of Messrs. Carter & Co. and that of the other tenderers on that basis? Yes; Carter & Co., £4,353 2s. 11d.; Ahearne, £6,814 19s.; Kerle and Kerle, £6,523; M'Kenzie, £8,070; M'Sweeney, £8,447 12s. 6d.; Holloway Bros., £9,698 15s.; Carson, £7,962 7s. 6d.; Deane, £8,682 15s.; Langtry, £9,847 14s. 6d.; Parry and Farley, £9,534 0s. 2d.; Stewart, £12,691 7s. 6d.
12289. Does your return show that the costly items were eliminated to the advantage of the contractors? The item subducts was omitted amongst others.
12290. But, taking the average of the list, are the cheaper items or the costly items omitted? The cheaper items are omitted in seven or eight instances.
12291. Will you look at item 34;—what is cement facing put down at by Carter, Gummow, & Co. in their tender? 5s. a superficial yard  $\frac{5}{8}$ " thick—1 to 2.
12292. Is that an excessive or moderate price? It is a very excessive price.
12293. Look also at the item of timber and iron in excavations;—what is Carter, Gummow, & Co.'s price for that? 1d.
12294. Turn now to the schedule of Messrs. Carter, Gummow, & Co.'s prices upon page 76 of the Parliamentary return, and tell me what it amounts to? 9,000 cubic feet.
12295. Turn now to the payment upon the final voucher;—how many feet are given there? 9,818 feet.
12296. Therefore, that would be 818 feet in excess of the item given in the schedule? Yes.
12297. If Mr. Hickson said in his evidence that there would be 9,000 feet extra, that would be a mistake? An evident mistake.
12298. The cement facing at 5s. will return the contractors far more than double the loss upon the timber, will it not? Yes, certainly. You cannot count the whole value of the timber as lost, because the cost of the timber is put into the excavation.
12299. But taking the proportion of these two items? The timber, I suppose, would cost about £740, and the cement facing is an item of £2,690. The profit on that item, the net value of which is about 1s. 6d. per yard, would far outweigh any loss upon the other.
12300. There is not such a serious loss upon the timber, then, when you have regard to some of the other items upon which Messrs. Carter, Gummow, & Co. were paid? No.
12301. Coming to the item of subducts at 1d.;—if those subducts had been put into the contract, would they not, as a matter of fact, have facilitated the work? Yes; of course that depends upon the nature of the country passed through.
12302. If water ran through these sewers while they were in course of construction it would carry material away with it? I presume so. Of course I do not know much about the construction of sewers. I do not pretend to do so.
12303. You have had a great deal of experience in the making out of tenders and quantities; can you understand how items in the tender, measured up, would come out uniformly, item after item;—could that happen? No; each particular class of work is supposed to have a special value. The values would differ naturally.

12304. Can you imagine why uniform prices should have been put into Carter, Gummow, & Co's. tender ;— with what object would it be done ? I cannot say ; I cannot make that out.
12305. Coming to the item of excavation ;—it is divided into excavation in the tunnelling and excavation in the shaft ;—as to excavation in the shafts, can you understand how it is that it is put at 4s. in the hard rock with light blasting, and also at 4s. under the heading of soft material ? No ; there ought to be some increase in price.
12306. Can you also understand why heavy blasting should be put at 4s. and guttering and gadding should also be put at 4s. ? No.
12307. Then, coming to the item of excavation in less hard material, at 40s., can you understand the sudden difference in price ? No ; that is the cheapest of the whole of the classes of shaft work. It should not be at that price on the face of it.
12308. You could not, as a quantity surveyor, honestly, in making up a tender, put in figures like that, could you ? No ; it could not be done unless one knew the quantities likely to be exceeded.
12309. Supposing you did put in such figures, would they not be disastrous to your client ? Unless one knew that there would be more of a particular item and less of another. Then it could be done safely.
12310. It could be done if the contractors had information beforehand, but not otherwise ? The information might be gathered in various ways.
12311. *His Honor.*] The table you have handed in is a correct comparative statement of the whole of the contractors' schedules ? Yes ; I have carefully checked the items.
12312. I suppose the table explains itself ? The headings explain it.

W.  
Thompson.  
12 Aug., 1896.

James Symonds recalled and further examined :—

12313. *Mr. Parkes.*] You have paid a visit to the Monier culvert at Strathfield ? Yes.
12314. Is it in good order ? Yes, it is in fair order.
12315. Have you made an estimate on the comparative cost of this culvert carried out by the Department, and the cost of a brick arch ? Yes. [*Vide Appendix, No. 50.*]
12316. *His Honor.*] I suppose you mean a brick arch of the same capacity ? Yes.
12317. *Mr. Parkes.*] What is the thickness of the brick arch you have estimated ? I have taken out a 9-inch brick arch and a 14-inch brick arch.
12318. As a substitute for the Monier work a 9-inch brick arch would have to be used ? Yes.
12319. It would be 9-inch radiated brickwork, laid in cement mortar ? Yes.
12320. Is your 14-inch work also laid in cement mortar ? Yes ; both of them. The area of the arch is 351 superficial feet. The cubic contents of the 4½-inch work are 4¾ cubic yards ; of the 9-inch work, 9¾ cubic yards, and of the 14-inch work, 14¾ cubic yards. The estimated cost of the 9-inch work at 45s. per cubic yard would be £21 18s. 9d., or equal to 4½-inch Monier compo. work at 90s. per cubic yard. The estimated cost of 14-inch brickwork in a cement arch would be, at 45s. per cubic yard, £32 18s. 1½d., or £4 2s. less than the actual cost of the present Monier arch, which amounts to £7 11s. 6d. per cubic yard, or a total of £37.
12321. Where did you get your amount of 90s. per cubic yard for the Monier compo. work ? That is the price you gave me.
12322. That is what you saw in the printed evidence pointed out to you by me ? Yes.
12323. Do you know what it actually cost ? £7 11s. 6d. per cubic yard.
12324. What would that cost be composed of ? It is principally due to supervision, and the arch was carried out by day work. There was some hindrance after the first section was put in. They had to wait some time before they could let the traffic over it. They waited, I think, nearly a fortnight.
12325. That increased the cost ? It increased the cost, because the men were not doing much. They were merely preparing the stone. That is what they were doing on several days.
12326. Are you still under the impression that a barrel drain would have been sufficient for the purpose ? Yes ; I think a 3-foot barrel drain would have been sufficient.

J. Symonds.  
12 Aug., 1896.

Joseph Davis recalled and further examined :—

12327. Were you supervising engineer upon Contract 69 over all the other engineers ? Up to April, 1895.
12328. You wrote the following minute :—

J. Davis.  
12 Aug., 1896.

Department of Public Works, Roads and Bridges and Sewerage Branch, Sydney, 9 May, 1894.

*Subject* :—Contract No. 69, Eastern Branch, Western Suburbs—Pitching round Man-hole Covers.

As some of the man-holes on this contract are being constructed, I should like the Engineer-in-Chief's decision as to the kind of pitching, if any, which is to be put round the man-hole covers.

Twelve square yards of squared bluestone pitching were included in the schedule of quantities, which the contractors have priced at £50 per square yard. The quantity likely to be used if the whole of the man-holes are to be pitched will be 35 square yards, which, at schedule rates, will amount to £1,750.

Special bluestone concrete will answer the same purpose as bluestone pitchers, and will only cost—9 cubic yards, at 50s.—£22 10s.

The fair price for bluestone pitching is about 25s. per square yard, and, as the schedule rate is so much higher than the market rate, the question arises whether the pitching should not be omitted. If, however, this course is considered to be unfair to the contractors, then only the quantity included in the schedule of quantities need be carried out.

J.D.

We cannot in fairness omit an item for which, no doubt, the price is absurdly high, while we know that on other items the price is equally low. Where bluestone pitchers are shown on drawing contractors must be paid for same at schedule rates.—R.R.P.H., 11/5/94.

Mr. Millner to note.—J.D., 11/5/94.

Noted.—W.J.M., 11/5/94.

Mr. Davis.

File.—J.D., 15/5/94.

When you wrote that minute you pointed out that this item could be omitted ;—on what grounds did you do that ? I went on the general ground of the clause attached to the contract and contained in the general conditions giving the engineer power to omit or to increase work at his will. The question is, how far that would apply in a case of this sort—equitably, I mean.

12329. There is such a clause in the specification ? Yes.

12330.

J. Davis. 12330. If that clause is put in to assist the Engineer-in-Chief or his sub-officers from being bested in the rigging of schedules, what would you say to that? I should not say that that was the reason for putting it in. The reason is that exigencies might arise in connection with the work—that is, during its progress—which would necessitate an alteration of the design, with possibly an omission or increase. I should say that that would be the primary reason for the insertion of that clause.

12 Aug., 1896.

12331. It is practically the same thing? I do not think that general conditions contemplate the rigging of schedules to the extent that we had in Contract 69.

12332. You say, "If, however, this course is considered to be unfair to the contractors, then only the quantity included in the schedule of quantities need be carried out."—You referred there to 12 yards in probable quantities? Yes.

12333. In connection with the substitution of a single for a duplicate sewer, will you read Letter No. 25, which appears upon page 127 of the Parliamentary papers? Yes; it is as follows:—

Department of Public Works, Roads and Bridges and Sewerage Branch,  
Sydney, 21 September, 1894.

*Minute Paper.*

*Subject* :—Western Branch, Western Suburbs, recommending that a single sewer be substituted for the two sewers originally proposed.

In the original scheme for the drainage of the western suburbs two sewers are provided to run side by side from Premier-street to a point in the Terrace Road where the Canterbury sewer branches off to that suburb, a length of 70 chains. Over twelve months ago the survey was completed for the two sewers, and in anticipation of their being continued the length of tunnelling and lining from Premier-street to the Illawarra Road was included in the contract for the eastern branch. The tunnel is now driven for the two sewers for this length, and the lining will be proceeded with in a few days.

With a view of seeing how the cost of a single sewer would compare with that of a double one, estimates have been prepared, which I attach. They show that the double sewer—

|  |   |    |    |
|--|---|----|----|
| For the length from Premier-street to Terrace Road, exclusive of shafts and aqueduct,<br>to be ..... | £   | s. | d. |
|  | 22,867                                    | 3  | 9  |
| And the single sewer, 7 ft. 8 in. x 6 ft. 8 in., to be, on same basis.....                           | 13,758                                    | 13 | 9  |
|  | Saving in favour of one sewer .....       |    |    |
|  | 8,108                                     | 10 | 0  |
| To this must be added saving in shafts.....  | 1,000                                     | 0  | 0  |
| And saving in cost of aqueduct .....   | 1,500                                     | 0  | 0  |
|  | Total saving in favour of one sewer ..... |    |    |
|  | 10,608                                    | 10 | 0  |

12334. Who prepared the original plans for the duplicate sewer? It was Mr. Stayton's proposal, passed by the Public Works Committee.

12335. Who was chief of the Department then? Mr. Bennett.

12336. The successor of Mr. Bennett cured the mistake? I would not regard it as a mistake, because I know the object they had in view in putting in two sewers at the time they were adopted. The survey that was made was very rough indeed. It was a question as to whether by raising the flow line a foot they could get through some of the depressions that existed, so that I should not regard it as a mistake by any means. I took advantage of the fuller knowledge we had, and made a proposal which will have the effect of saving over £10,000.

12337. That is not a saving though, is it? It is a saving.

12338. The work has not commenced? It is in hand.

12339. But when this minute was written the work had not commenced? It had practically commenced. If the original design had been put in between Premier-street and the Illawarra Road, then the whole of the 70 chains must have been constructed in that way. It was a question of arriving at a decision at that stage for the carrying out of the proposal.

12340. Will you read the further letter which you wrote, and which appears upon page 131 of the Parliamentary papers—I refer to paper No. 26? Yes; it is as follows:—

Gentlemen,

Department of Public Works, Sewerage Branch, 11 October, 1894.

Referring to the conversation which I recently had with you, and to the interview which Mr. Millner had with you two weeks ago respecting the substituting of a single sewer for the double one, shown on contract drawings, between Premier-street shaft and the shaft at the Illawarra Road, I have the honor to inform you that the Engineer-in-Chief has decided to substitute a 7-ft. 8-in. x 6-ft. 8-in. sewer for the double one, and that you will be allowed for the expense you have been put to in connection with the double sewer, as arranged with Mr. Millner, viz., £37 10s.

The cross section of sewer will be as shown on attached tracing. Drawings will be forwarded in a few days of the shaft at the Illawarra Road, and of any slight alteration it may be necessary to make in the inverts of the Premier-street shaft chamber.

In the meantime you will please proceed with the construction of the single sewer, as shown on the tracing attached.

I have, &c.,

J. DAVIS,

Supervising Engineer for Sewerage.

12341. Will you read the next paper? Yes. It appears to be a letter from Carter, Gummow, & Co., to the Engineer-in-Chief for Sewerage, and is as follows:—

Sir,

Marrickville, 11 November, 1894.

In reply to your letter of 11th October, with regard to alteration of design between Premier-street shaft and Illawarra Road, we beg leave to state that we will accept the terms therein, provided a special item be arranged for the filling at the rate of 5s. per cubic yard.

Yours, &c.,

CARTER, GUMMOW, & CO.,

Contract No. 69.

Mr. Davis.—R.H., 11/11/94.

Commissioner for Roads.—D.C.M'L. (*pro* U.S.), B.C., 15/11/94.

Will Mr.

Weedon please let me have quantity of filling.—J.D., 17/11/94.

Quantity of filling, due to alteration in design, 410

cubic yards.—S.H.W., 20/11/94.

12342. Will you read your recommendation, which appears upon page 132 on the Parliamentary papers? Yes.

The schedule rate for filling is 6d. per cubic yard, but it is manifest that the contractors, in giving this low price, did not contemplate doing the kind of filling required in connection with the western branch sewer, between Premier-street and Illawarra Road. The 5s. asked is, I consider, a little high, but I suppose, as they will lose something by the reduction of concrete and brickwork, occasioned by the alteration, it will be just to take this into account, and allow them what they ask. There will be about 400 cubic yards of this filling, which, at 5s. per cubic yard, would amount to £100. I recommend that the price named be approved.—J.D., 21/11/94. Commissioner and Engineer-in-Chief for Roads, Bridges, and Sewerage.

12343. Is not that rather an excessive price? No doubt it is a little high.

12344.

J. Davis.

12 Aug., 1896.

12344. Is it not treating the contractors rather generously to reduce the £750 they undertook to forfeit after making an arrangement with them to do the work under these conditions? I do not think it is treating them so very liberally. It must be considered that they met us very fairly. They had everything ready to proceed with the two sewers, and I saw that what we proposed was going to be an advantage to us. They met us fairly and willingly, and I thought that they were entitled to consideration.

12345. Did you not think that they had got the best of the bargain? I do not see how they could. The only advantage would have been in about a shilling a yard for the price of filling, which would have amounted to about £20.

12346. Contractors, in their arrangements, generally take care that they get the best side of the bargain? Contractors are very much like other persons. I find that they like to do the best they can for themselves. You have to watch them.

12347. Will you read Mr. Hickson's minute, under date of 21st November, 1894? Yes; you will see it upon page 132. It is as follows:—

This addition is caused by an alteration in the original design, which has the effect of reducing the cost of the work in this contract by about £750, and a further reduction on the whole work of £10,000. Recommended for approval.—R.H., 21/11/94.

For approval.—J.B., 28/11/94. Approved.—J.H.Y., 29/11/94. Roads.—D.C.M'L. (*pro* U.S.), B.C., 29/11/94. Seen.—R.H., 30/11/94. Mr. Weedon to note.—J.D., 4/12/94. Noted.—S.H.W., 6/12/94. File.—J.D., 7/12/94.

I ought to explain that that amount is really £10,800.

12348. The work was not in course of construction? Not at that time.

12349. Suppose you take the £750 and deduct the £100 for filling and £37 10s. for centering? The question is whether it should be deducted. It is probable that it had been deducted by Mr. Hickson in connection with the £750. I do not know that it had been. I cannot speak positively about it; but that was probably the case.

12350. Is there not a grave error in the comparative estimates which appear upon page 131;—you will see there an estimate of an 8-ft. by 7-ft. single sewer; then there is an estimate for double sewers 6 ft. 10 in. x 5 ft. 10 in. and 5 ft. 2 in. x 4 ft. 2 in.;—you say that the excavation had been done? The excavation had been done for the 6 ft. 10 in. x 5 ft. 10 in. and the 5 ft. 2 in. x 4 ft. 2 in. sewers, and in the ordinary way the contractors would be paid for it. [*Vide Appendix No. 51.*]

12351. If that is so the quantity of 1,541·3 yards should not appear in those estimates, because it is common to both? No; I think you are looking at the matter in the wrong way. The excavation for the sewers 6 ft. 10 in. x 5 ft. 10 in. and 5 ft. 2 in. x 4 ft. 2 in. would come in to some extent. It would not be thrown away.

12352. The price paid for the 8-ft. x 7-ft. sewer is £3,452, and for the double sewers £4,173. That makes about £750 of difference, but you forget that the excavation was done in both cases. Therefore the £750 disappears? The excavation was done for the duplicate sewer, but there would be required in addition to that a certain amount of excavation in order to put in a single sewer. Part of the excavation in the duplicate sewer would go for nothing.

12353. The whole of the excavation was already done for the duplicate sewer, and you were about to put in a single sewer;—in making a comparative estimate with the 8-ft. x 7-ft. sewer you must add the total of the excavation? Not necessarily, because more excavation would be required for the single sewer than for the duplicate.

12354. There is a difference of £750 or thereabouts in the two estimates? That would seem to be the case as far as I can see.

12355. The actual difference is £721, is it not? Yes, apparently.

12356. There is nothing saved between the last two comparisons given upon page 131—I mean the totals of £4,068 and £4,173;—they are practically the same, so there is no £750 saved there, and there is certainly not a saving of £750 in the comparison given above? I will look into that matter. I really do not understand these estimates myself at the present moment. I do not see why two sets of estimates should have been given in the first instance at all in connection with the 8 x 7 sewer. For the moment I cannot think why that should have been done.

12357. But on the face of it, if the excavation is done it must be common to both estimates? In so far as the excavation would serve for the larger sewer.

12358. If it were increased for the larger sewer there would be an addition to the 1,541 yards? Yes; but I should be glad if you would kindly defer your questions upon this point. I will look into it, and I shall then be able to say precisely what did take place.

12359. Did you yourself check the final voucher for Contract 69? No; I had not charge of the work at that time.

12360. Who would be responsible for it? Mr. Darley, the Engineer-in-Chief; and Mr. Griffiths would be immediately under him.

12361. As you go along with the measurement of excavations, what is the course of procedure of the inspector on the work? The course is this: as soon as the shafts are bottomed, and we know precisely the kind of ground the tunnel has to be driven in, the contractor is instructed what size to drive the tunnel.

12362. Before he proceeds? Yes, you may say that. I do not know that he would stop his men until he got a letter, but that is the first thing done. As soon as the shafts are bottomed the contractor gets instructions what size he is to drive a tunnel. Those instructions may be varied during the progress of the driving until the tunnels meet.

12363. And the contractor is paid upon that? Yes; upon what is ordered.

12364. Are those instructions noted in any book? They are letters.

12365. Can you show us the letter-books? I believe so; I believe you will find all the letters there.

12366. When did you leave this job? In April.

12367. Was the excavation all done before April? I believe so. There would be very little to be done then.

12368. Was there any in the tunnelling to be done after April? I scarcely think there was, but I am not sure.

12369. Did the material vary much between the plan and the actual tunnel? It varied in this way: where we showed shale from the borings we found shale, but the shale varied in hardness. In some cases

J. Davis.  
12 Aug., 1896.

it would stand without timber; in other cases timber had to be inserted, and where timber had to be inserted, then the tunnel was necessarily very much larger. Where the tunnel was driven without timber in the shale, then it was driven for two-ring work.

12370. Could you mark on the plans the place where the hard shale occurred? I think there is a plan in existence showing the work as carried out, and you will see from that precisely what is done. If you have not got the plan here, I can supply it.

12371. Do the inspectors keep a record book containing the orders they give the contractors? They give no orders to the contractors. They have no discretionary power whatever.

12372. You alone do that? I or the Engineer-in-Chief would write the letters. The engineer upon the work makes reports from time to time, any changes in the size of the tunnel, or anything else of that kind which may occur. That is approved in the proper way, and the contractor is informed by letter.

12373. Would those letters appear in the letter-book? If Mr. Hickson wrote the letters they would be in his book, and if I wrote them they would be in mine.

12374. Could you furnish the Commission with particulars of the whole of the letters in connection with this particular contract? If they are not already printed, but I am inclined to think they are printed in connection with the Parliamentary return. I know that at the time the contract was let, in view of the fact that the contractors' prices were so very peculiar, to say the least of them, the utmost care was exercised so that we might get as good a result as possible. I know there were comparative estimates made of the shafts to find out whether it would be better to put in brickwork or concrete.

12375. Can you refer me to the letter in the Parliamentary papers containing the order as to the size the tunnel was to be driven? I think you will find that upon page 121 of the Parliamentary papers, paper No. 7. You will find there that the cross-sections are all shown. You will see that comparative estimates have been made of the different kinds of lining.

12376. Were the sizes not to be increased above those given there? No; those were the maximum sections.

12377. The maximum sections for which they would be paid? For excavation; then there is the margin for what we call the packing.

12378. How much would that be? I could not say. The measurement book would show it.

12379. Would it be 4 inches? It might be more. I am not sure whether in the specification there is any limit.

12380. Have you the measurement book here? I see that there is no limit to the packing in the case of this contract. The measurement book would show precisely what packing was paid for.

12381. And would the payment for excavation be limited to the cross-sections shown in the document to which you have referred? For excavation, certainly. The payments will be limited to whatever was ordered during the progress of the work. In addition to the concrete there would be the timbering on the outside. The plan I have sent for would show that. According to the contract the contractors would be entitled to excavation to the outside of the timber.

12382. By how much would the timber exceed these sections? First of all there would be a space between the outside of the concrete and the inside of the timber to admit of boxing being put round the concrete. That would be the first thing that would have to be allowed for. Then there would be the thickness of the leg or prop, and then behind that again there would be the poling boards. They would take up probably a space of  $4\frac{1}{2}$  inches.

12383. In your instructions the size of that margin would be allowed? Yes; there seems to have been a sketch upon my letter No. 9. I will read the paragraph referring to it. For instance, I say, "As to tunnels in more or less hard material which require timbering, I have to request that you will excavate the same to the cross-sections shown in the margin."

12384. Are the sections shown in the Parliamentary return marginal sections? I am referring now to a sketch on the margin of my letter. Carter, Gummow, & Co. will have that letter if it be in existence at all.

12385. Ought not the sketch to be shown in the copy of the letter? No; because it is usual to send the letter to a draftsman, and any sketch which it is necessary to put on the side of it would be put in with Indian ink, and that would not copy.

12386. Would you not keep a record of it? I have no doubt there is a record, but I do not know where it would be.

12387. Do you recollect what the size was? It would be about the size I say.

12388. About what size is that? I can only give it to you approximately. It would be about 2 ft. 6 in. wider than the concrete—that is, going to the outside of the timbering. There would be about 15 inches on each side.

12389. Would there be as much as 15 inches on the outside of the concrete on each side? Yes.

12390. I suppose that in no case where timber was used would the 15 inches be exceeded? That is an approximate measurement. That would be the usual size which would be allowed for the excavation.

12391. With reference to the surplus material, do you know where it was carted to, or whether it was carted away at all? I do not know what became of it. The contractors either took it away or arranged for it to go away. That is all we were concerned with. In that particular contract we did not want the material ourselves. Had we wanted it we could have ordered it to be taken to wherever we required it; but, it not being required, the contractors were left to dispose of it as best they could.

12392. Referring to the Premier-street shaft, was any portion of that shaft done under Contract No. 62? Yes; the shaft was sunk. I am not sure about the dimensions, but I think it was 5 feet by 12 feet.

12393. Who had Contract No. 62? Mr. McSweeney.

12394. Did he do any work in connection with the shaft besides sinking it? No, I think not. He sank the shaft and used it to drive his tunnel. That was lined up to within a short distance of the shaft, and Carter, Gummow, & Co. would of course start driving their tunnel from that point. I ought perhaps to explain that it was originally proposed by Mr. Bagge that a very elaborate staircase should be put into that shaft, but Mr. Hickson, from motives of economy, had the drawing which Mr. Bagge had prepared cancelled, and another drawing was substituted before tenders were invited, with an ordinary plain shaft. Mr. Bagge then proposed to increase the size of the shaft to get the penstock up and down. It was a good idea, no doubt, but of course it would cost money. During the progress of the work, after taking the matter into consideration, I recommended that the shaft should not increase in size, and finally the shaft, as left by Mr. McSweeney, was lined with concrete and covered in at the top.

12395. Will you read your minute of 23rd March, 1895, which appears upon page 133 of the Parliamentary papers? Yes. It is as follows:—

J. Davis.

Department of Public Works, Roads and Bridges and Sewerage Branch,  
Sydney, 23 March, 1895.

12 Aug., 1896.

*Minute Paper.*

*Subject:—Shaft at Premier-street.*

THE present size of the shaft at Premier-street, excavated under Contract No. 62, is 12 ft. x 5 ft. In Messrs. Carter & Co.'s contract, No. 69, provision has been made for enlarging the shaft to 14 ft. x 7 ft., and to line it with brickwork. The top of the shaft is left open, and surrounded by an iron railing, which would not prevent children and others getting into this shaft.

I do not think that there is any necessity to make the shaft larger than it is at the present time, and the iron railing would certainly be dangerous.

I recommend that the shaft be not increased in size, that it be lined with bluestone concrete, and that it be arched over, and a manhole cover be put on in the usual way. The saving that will thereby be effected will amount to £50.

J.D.

Approved.—R.P.H., 25/3/95. Messrs. Carter, Gummow, & Co., 25/3/95. Mr. Millner to note.—J.D., 25/3/95.  
Noted.—W.J.M., 29/3/95. Mr. Davis. File.—J.D., 30/3/95.

12395½. If that £50 represents the only saving, it would not have been so much more costly? Well, £50 is £50.

12396. Would there not be a greater saving than that effected in the abolition of the stone staircase alone? This recommendation has nothing whatever to do with the stone staircase. Mr. Hickson himself before the contract was let cancelled the original drawing, and the word "cancelled" was written right across it. That was before tenders were invited. The £50 refers merely to the enlargement of the shaft from 12 feet by 5 feet to 14 feet by 7 feet. Besides, you might say that the man who took care of £50 would be likely to take care of £50,000.

12397. Suppose the amount happened to be £150; the stone staircase is in the schedule, is it not? It may be included in the probable quantities, but it is not specifically mentioned. The drawing was prepared for a spiral staircase, but when the contract was submitted to Mr. Hickson he had that drawing cancelled and another drawing substituted.

12398. Then why did you not take the item out of the schedule? There is no such item in the schedule. What I said was that the work of the spiral staircase shown in the drawing might be covered by the schedule.

12399. The item of iron railing you say would be omitted, but, as a matter of fact, is it not paid for in the final voucher? It would not be paid for in the final voucher unless it were put in. I should be very much astonished to find that it was paid for.

12400. What is the price given by Messrs. Carter, Gummow, & Co. in their schedule upon page 67 of the Parliamentary return? That would be for the second design to which I have referred.

12401. You say in your minute of 23rd March that the top of the shaft is left open, and is surrounded by an iron railing; that iron railing was done away with, and a dome was put over the shaft? Yes. I myself did not carry out the work, but I recommended that that should be done, and I presume it was done.

12402. I think you will find that they were paid £10 17s. 5d. for the railing? I do not know whether they were paid for it or not, but if they were paid for it it might be accounted for in this way—that the contractors would get the railings before the alteration was made in the plan, and the Department might have to take them over on that account.

12403. But that would not include the fixing? I do not know of my own knowledge whether that would be included or not.

12404. Have you not been to the work since? Not to the Premier-street shaft.

12405. But if the amount has been saved it ought not to appear in the schedule, ought it? The railing could only have been paid for as you suggest, upon the supposition that I have just mentioned, if it were not actually used in the work. It would then be in stock for other use. It might not be worth the amount which you see put down in the papers, but it would be worth something.

12406. *Mr. Norrie.*] Might not the iron you refer to in the schedule have been fixed in the staircase below ground? I think it would be much better to ask Mr. Griffiths questions as to what was done with that railing, because after all he had to do with the matter.

12407. *Mr. Parkes.*] Was the plan you now produce showing the work which was actually done on Contract 69 made under your instructions? It was commenced during the time I had charge of the contract, and was finished off afterwards, when the final voucher was submitted.

12408. Complete measurements of the work can be obtained from this plan? I believe so, as far as I know. I have not checked it myself, but it should correspond with the final voucher.

12409. *His Honor.*] As to the bluestone pitchers;—do I understand that you contend that it was within the equity of the contract and specification that if more than the estimated quantity of work were ordered at an exceptionally high rate you could not take advantage of the condition in the contract enabling you to vary the nature of the work, and then to bring the work to be done under a lower rate? I think that by straining a point I might do that; but the question is whether it would be treating the contractor quite fairly. I know that I did that in respect to the guttering and gadding at North Shore, and it was a question with some whether I had not gone a little too far. However, I felt that it was the right thing to do under the circumstances, and I recommended it; I took the responsibility of it. In regard to the bluestone pitchers, I felt that it would be scarcely equitable to cut out the bluestone pitchers altogether. It was questionable in my mind whether the clause in the general conditions dealing with excess and reduction would quite cover such an action. I felt that perhaps if we gave them what was put in the schedule they could not complain. Mr. Hickson, on the other hand, thought that if we gave them what was shown on the drawings it would be as much as they were entitled to.

12410. Twelve yards were given in the estimated quantities? That 12 yards must be either a mistake on the part of the quantity surveyor or it must be a printer's error.

12411. Do I understand you to mean that the original drawings showed 32 square yards? Yes; whereas the quantity given in the schedule is 12 yards. There must have been a clerical error there. Carter, Gummow, & Co. detected it, and took advantage of it—there is no doubt about that; and the question under the circumstances was, what had best be done?

12412.

- J. Davis. 12412. That is how the quantities come to differ. It was not that an increase of quantity was put in? No; it must have been an error. The pitching shown upon the drawings amounts to 32 square yards or thereabouts. Some of the manholes which are shown were not to be pitched. Mr. Hickson took advantage of that, and decided that only those which were shown should be fixed. Before the pitching was carried out, however, the works were passed over to Mr. Darley, and he appeared not to be aware of Mr. Hickson's decision. That is the reason why the quantity was increased from 32 to 38 yards.
12413. Then I understand that Mr. Hickson considered himself bound to the drawings, although the estimated quantity in the schedule was less, in error? Yes.
12414. Mr. Hickson refused to go any further than the drawings? Yes.
12415. And afterwards, somehow, the contractors were allowed to go further than the drawings? Yes. They got about 38 square yards, I think.
12416. No doubt you are right in saying that special bluestone concrete would have answered the purpose quite as well? Yes; although it might not have been quite as convenient for the contractors, because they put the pitchers in one day and use them the next. In the case of special concrete a certain time must be allowed for it to get hard.
12417. How long would they have to be protected? For eight days or so—not less than that. That would enable the concrete to harden. Another aspect of the case is this: The specification provides for the whole of the manholes to be pitched. The specification and drawings were at variance. Mr. Hickson took advantage of that in deciding that the drawings should be adhered to in this case, and not the specification.
12418. *Mr. Parkes.*] Can you tell me where the 38 yards of freestone pitching was to go to? That had to do with the culvert; it had nothing to do with the covers. It had to do with a culvert on the Illawarra Road. An alteration was made in that culvert during the progress of the work.
12419. The pitching was omitted,—it was not carried out? That had nothing whatever to do with the covers. It stands to reason that if you put sandstone pitching round the manholes you would have to renew them in a month's time.
12420. *His Honor.*] They would have to stand the wear and tear of the street? Yes.
12421. *Mr. Parkes.*] Will you show me from the plan where the bluestone pitchers go? Yes; I think you will find all the covers pitched in that way. I may mention that No. 1 is not pitched; it is on resumed land, and there would be no traffic over it. Mr. Griffiths, however, knows more of this matter than I do. I have explained it to the best of my knowledge.

George Christie recalled and further examined:—

- G. Christie. 12422. *Mr. Parkes.*] You have prepared some statements as to the papers concerning Contract 69. In the first place, you have prepared a memorandum showing the papers which have been omitted from the Parliamentary return? Yes, it is as follows:—

MEMO. No. 13.

As to additional papers referring to Contract 69.

(a) In the return furnished by the Department of Public Works to the Legislative Assembly in compliance with an order dated 10th October, 1895, the following important papers having reference to Contract 69 were omitted:—

| Registration No. | Date.               | Writer.  | Subject.  |
|------------------|---------------------|--|---|
| 93-1,446         | 4/11/93             | Holloway Brothers, Goulburn (Letter to Minister for Works)                             | "We are desirous of tendering for Contract No. 69, Sydney Sewerage, but the cash deposit stands in our way. We, therefore, ask if you cannot accept a less cash deposit in our case, say £1,000, and sureties for the balance? * * *" |
| 93-1,446         | 17/11/93            | Under Secretary (Letter to Holloway Brothers).   | The Minister cannot consent to any reduction in the cash security required.   |
| 95-153           | 29/5/95             | E. Hungerford (Memo. to J. M. Smail, Acting-Engineer-in-Chief, Metropolitan Sewerage). | Drawing attention to the necessity of obtaining Ministerial authority for the payment of contractor's claim in excess of the amount of the contract.  |
| 95-508           | 3/5/95<br>(3/6/95)? | J. M. Smail (Minute).....  | Recommending Ministerial sanction to an excess of £2,634 13s. 4d.   |
| 95-508           | 11/7/95             | C. W. Darley, Engineer-in-Chief, Metropolitan Sewerage Construction.                   | Requesting Ministerial sanction to an excess of £6,200. (This includes the above £2,634 13s. 4d.)   |
| 95-897           | 18/9/95             | E. M. Clark, M.P. (Letter to the Under Secretary for Public Works).                    | Urging extension of Carter, Gummow & Co.'s Contract (No. 69) at Marrickville.   |

(b) The following important papers bear dates subsequent to the order of Parliament:—

| Registration No. | Date.    | Writer.   | Subject.  |
|------------------|----------|---|---|
| 95-1,077         | 28/10/95 | C. W. Darley, Engineer-in-Chief, Metropolitan Sewerage Construction (Minute). | Requesting Ministerial sanction to a total excess payment of £9,100 (being £2,900 in excess of the £6,200).   |
| 96-836           | 27/2/96  | Same (Minute) .....   | Reporting completion of works, Contract 69, and recommending that penalties be remitted and final account (£9,100 above the estimate) paid in full. |
| 96-409           | 27/3/96  | Carter, Gummow, & Co. (Letter).   | Requesting refund of costs (£272 19s. 10d.) incurred in defending certain actions at law.   |

(c) The whole of the above papers are marked as registered in the departmental registers, and the entries appear in those registers and in the indexes thereto.

12/8/96.

GEO. C.  
12423.

12423. You have also prepared a memorandum with reference to the letting of Contract 69? Yes. It is as follows:—

G. Christie.  
12 Aug., 1896.

MEMO. No. 14.  
Re the letting of Contract 69.

(a) Tenders were originally advertised to close on 15/11/93 for the works, at an estimated cost of £78,162 18s. 2d. Consequent, however, on Mr. Hickson's minute of 7/11/93, the time was extended to 13/12/93. When the plans and specifications were finally submitted, the Department's estimate of the cost was £64,420 6s. 5d.

(b) Eleven tenders were received, of which Messrs. Carter, Gummow, & Co.'s was the lowest, at £45,207; the next lowest being that of Mr. John Ahearn, at £47,061. The report on the tenders, dated 14/12/93, appears on pages 66 to 69 of the Parliamentary return. In this Messrs. Carter, Gummow, & Co.'s tender was recommended for acceptance.

(c) The acceptance of Carter, Gummow, & Co.'s tender was notified by letter from the Under Secretary on 27/12/93. This letter contains two special conditions:—First, that the contractors are to accept funded stock in payment; and, second, that "the Secretary for Public Works is willing, in response to your verbal request, to accept two approved bondsmen, in the sum of £4,520, as security for the due performance by you of the contract." Though not specifically stated, these bonds for £4,520 were in lieu of the cash security (£2,260) which was required in terms of the specification. See on page 118, clause 29 of the general conditions, as follows:—

"29. Within fourteen days after the notice of the acceptance of his tender shall have been given to the contractor, or posted to the address of his last known place of business or residence, he shall deposit with the Minister, or at the option of the Minister in some bank or banks in Sydney, upon fixed deposit in the name of the Minister, a sum calculated at the rate of £5 for every £100 or part thereof on the amount of his tender up to the sum of £100,000, and at the rate of £1 for every £100 or part thereof, in addition, for any amount over that sum, to be held by the Minister as security for the due and proper performance and completion of this contract until the Engineer has certified that the whole of the work in the said contract has been completed to his satisfaction, or until this contract has been cancelled by the Minister under the power given to him in that respect under clause 32 of these conditions, in which last-mentioned event happening the money so deposited shall become forfeited to the Crown, and shall be held by the Colonial Treasurer, for and on behalf of Her Majesty the Queen, as liquidated damages. If, however, this contract shall not have been cancelled under the said clause, and if the works comprised in this contract are not completed within the time mentioned in clause 31 of these conditions, the liquidated damages which, under the last-mentioned clause, are made payable to the Minister, may be deducted and taken from the money so deposited."

(d) Messrs. Carter, Gummow, & Co. assented to the terms of acceptance of their tender by letter of same date, 27/12/93 (see page 81).  
GEO. C., 12/8/96.

12424. You have also prepared a statement as to acceptance of sureties in lieu of a cash deposit of £2,260 on Contract 69? Yes; it is as follows:—

MEMO. No. 15.  
As to the acceptance of sureties in lieu of a cash deposit of £2,260 on Contract 69.

(a) The security required by the general conditions (see clause 29 on page 118) was, on the amount of Carter, Gummow, & Co.'s tender, a cash deposit amounting to £2,260.

(b) Some seven weeks prior to the acceptance of Carter, Gummow, & Co.'s tender, in which the Department agreed to accept two approved bondsmen in lieu of the above cash security, Messrs. Holloway Bros.' letter, of 4/11/93, was submitted to Mr. Hickson, to the Board of Reference, and to the Minister. In their letter, that firm of contractors requested that the Department would accept a cash security of £1,000, and sureties for the balance. Mr. Hickson's minute is as follows:—"The cash deposit is in accordance with the revised general conditions, and I do not see my way to recommend a departure therefrom. As, however, there is no doubt that good contractors find it difficult, at the present time, to fulfil this obligation, it might be advisable to discuss the matter at the next meeting of the Board of Reference." The document is then marked "List to refer to Board. J.B., 7/11/93." Following which appears—"Submitted to Minister, Order No. 3,889, and marked by him as under:—"I do not think the deposit is too large for a contract that may cost from £80,000 to £100,000."—J.B."

Messrs. Holloway Bros. were informed accordingly, as follows:—  
93/1446 S.B.

17 November, 1893.

Gentlemen,

With reference to your letter of the 4th instant, in which you state that you are desirous of tendering for Contract No. 69, Sydney Sewerage, and ask whether, in the event of your being successful, a cash security of £1,000, in lieu of the specified sum of £3,900, would be accepted, I am directed to inform you that the Secretary for Public Works considers that in a contract of this magnitude the amount specified is not unreasonable, and he cannot, therefore, consent to any reduction.

I have, &c.,

J. BARLING,

Under Secretary.

(c) After the acceptance of Carter, Gummow, & Co.'s tender, they, on 8/1/94 (see page 82) in a letter as below addressed to the Under Secretary for Public Works, informed him that Messrs. Charles James Henty (of Parbury, Henty, & Co., merchants, Pitt-street) and Frederick Lassetter (of Lassetter & Co., George-street) were prepared to become the required sureties:—

CONTRACT No. 69.—WESTERN SUBURBS SEWERAGE.

Sir,

Box No. 10, North Sydney, 8 January, 1894.

With reference to the acceptance of sureties in lieu of the fixed deposit security for the above contract, we have the honor to inform you that Messrs. Charles James Henty, (of Parbury, Henty, & Co., merchants, Pitt-street) and Frederick Lassetter (of Messrs. Lassetter & Co., George-street, City) are prepared to become such sureties, and will sign any necessary documents in connection with the same when called upon to do so.

We are, &c.,

CARTER, GUMMOW, & CO.

The Under Secretary for Public Works.

Are names satisfactory? Commissioner for Roads.—D.C.M'L. (pro U.S.), B.C., 9/1/94. Yes.—R.H., 10/1/94.

Mr. Norrie.—D.C.M'L. (pro U.S.), 10/1/94.

On 29/1/94 (see page 121), Messrs. Carter, Gummow, & Co. wrote submitting the name of Mr. R. L. Scrutton in lieu of that of Mr. Lassetter, as follows:—

SURETIES—CONTRACT No. 69.—WESTERN SUBURBS SEWERAGE.

Sir,

Box No. 14, North Sydney, 29 January, 1894.

With reference to the above we have to inform you that Mr. Frederick Lassetter will be unable to sign the necessary documents in connection with the same, owing to his immediate and permanent removal to England.

We have, therefore, to ask you to be good enough to allow the name of Mr. Robert LeNeve Scrutton (of R. L. Scrutton & Co., merchants, City) to be substituted for that of Mr. Lassetter.

We are, &c.,

CARTER, GUMMOW, & CO.

Under Secretary for Public Works, Sydney.

Is name satisfactory?—D.C.M'L. (pro U.S.), B.C., 30/1/94. Commissioner for Roads. Yes.—R.R.P.H., 1/2/94.

Mr. Norrie.—D.C.M'L. (pro U.S.), 1/2/94.

(d) The minutes at foot of each of these letters show that they were referred to Mr. Hickson to report as to whether the proposed sureties were satisfactory, and in each case he replied, "Yes."

(e) Reference is again made to these sureties in the contractors' letter of 20/9/94 (see page 127). In this letter the contractors ask for the return of £1,000 of the retention money, and speak of their sureties as being the firms of Parbury, Henty, & Co. and R. L. Scrutton & Co. Mr. Davis, in his minute thereon, also refers to the sureties as follows:—" \* \* \* and the personal surety being Messrs. Henty & Co. and Mr. R. L. Scrutton (firms, I suppose, which are safe) \* \* \* " The security, however, given the Department was not that of the firms, but was the individual personal security of Mr. Henty and Mr. Scrutton.

(f) In the acceptance of these personal securities the usual declaration as to the possession of property to the amount of the bond was not obtained from either Mr. Henty or Mr. Scrutton.

GEO. C., 12/8/96.

12425.

G. Christie. 12425. You have prepared a return as to advances on material, and also as to the return of the retention money to Carter, Gummow, & Co., in connection with Contract 69? Yes, it is as follows:—  
12 Aug., 1896.

## MEMO. No. 16.

As to advances on material and return of retention money to Messrs. Carter, Gummow, & Co., Contract 69.

(a) On 27/3/94, an agreement was made in the name of the Minister for Works for advances up to £1,000 on material (see page 71 of printed papers). Advances were made to the contractors on cement to the extent of £450 at one time as follows:—

|                                     | £   | s. | d. |
|-------------------------------------|-----|----|----|
| In certificate No. 2, 16/3/94 ..... | 450 | 0  | 0  |
| "    3, 19/4/94 .....               | 450 | 0  | 0  |
| "    4, 22/5/94 .....               | 270 | 0  | 0  |
| "    8, 21/9/94 .....               | 337 | 10 | 0  |
| "    9, 23/10/94 .....              | 157 | 10 | 0  |

(b) On 20/9/94 (see page 127 of printed papers), the contractors applied to be paid £1,000 from the retention money. The request was granted, and from that time forth (namely, from certificate No. 8, 23/10/94, £31,161 3s. 5d.), the security required by the specification was deficient by £1,000. The final certificate is to 23/10/95, £54,320 7s. 7d.; so that the amount of work done after return of this retention money was £23,159 4s. 2d.

(c) In neither of these cases is there evidence that the advance on material or the return of the retention money was made with the sanction of the sureties.

(d) Following on the stoppage of the issue of funded stock, which is referred to in connection with Contract 79, at page 328 in the printed papers, the sureties were parties to a document under which the contractors agreed to accept either cash or funded stock in payment. This agreement appears on page 126 of the Parliamentary Return, and is now referred to as evidence that it was deemed necessary to have the sureties as parties to any alteration in the terms of the contract.

The agreement is as follows:—

Sir,

North Sydney, 6 July, 1894.

With reference to our Contract No. 69, Sydney Sewerage, we are willing that the Government shall exercise the option of paying us all sums now due or to accrue due in respect of this contract, either in cash or funded stock, as may be thought fit.

We have, &c.,

JOHN CARTER.  
FRANK MOORHOUSE GUMMOW  
(By his Attorney, JOHN CARTER).  
D. G. SNODGRASS.  
GEORGE MADDISON.  
PETER EWING.

Witness,—ROBERT MILLER, J.P.

We, the sureties named in the bond in connection with the above contract, consent hereto.

Witness,—FRED. WOOLCOTT-WALLEY, J.P.

CHAS. J. HENTY.  
R. L. SCRUTTON.

Treasury informed, 9/7/94. For approval.—J.B., 10/7/94. Approved.—W.J.L. Accountant, Roads, to note.—  
F.C.P., 24/7/94. Seen;—Mr. H. to note.—O.C., 24/7/94. Mr. Wallwork,—Please place with Bond Ct. 69.—  
E.H., 24/7/94.

12426. In your opinion, as a business man, would the return of that money affect the sureties in any way? Yes.

12427. You think it should not have been done? Not without their consent.

12428. You have also prepared a memorandum as to the excessive payments to Carter, Gummow, & Co., in connection with item 36 in the schedule of Contract 69? Yes; it is as follows:—

## MEMO. No. 17.

Re the excessive payments to Messrs. Carter, Gummow, & Co., in connection with item No. 36 in Schedule, Contract No. 69.

(a) Item 36 in Schedule is:—"Squared bluestone pitchers, in any situation, as specified in clause 17."

The office estimate was as follows:—

12 square yards at 30s. = £18. (See page 67.)

(b) The prices quoted by tenderers were as follows (see pages 67 to 69):—

|                            |                       |      |
|----------------------------|-----------------------|------|
| Carter, Gummow, & Co. .... | £50 per square yard = | £600 |
| John Ahern .....           | 15s.   "   =          | 9    |
| Kerle and Kerle .....      | 60s.   "   =          | 36   |
| H. McKenzie and Sons ..... | 20s.   "   =          | 12   |
| J. McSweeney .....         | 45s.   "   =          | 27   |
| Holloway Bros. ....        | 30s.   "   =          | 18   |
| J. F. Carson .....         | 20s.   "   =          | 12   |
| A. Dean and Sons .....     | 30s.   "   =          | 18   |
| Langtree and Owen.....     | 20s.   "   =          | 12   |
| Parry and Farley.....      | 20s.   "   =          | 12   |
| J. Stewart & Co. ....      | 30s.   "   =          | 18   |

(c) The actual payment to Carter, Gummow, & Co., under this item (No. 36 of Schedule) was as follows:—  
36½ square yards at £50 = £1,825. (See final certificate to 23/10/95.)

(d) Reference is made to this item in the schedule in Supervising-Engineer Davis's minute of 9/5/94. This minute points out that 35 square yards will be required, which at schedule rates would cost £1,750; whereas "special bluestone concrete," which would answer the same purpose, would only cost £22 10s. This would be a difference of £1,727 10s. The minute reads as follows:—

## MINUTE PAPER.

Department of Public Works, Roads and Bridges and Sewerage Branch, Sydney, 9 May, 1894.

Subject:—Contract No. 69, Eastern Branch, Western Suburbs—Pitching round Man-hole Covers.

As some of the man-holes on this contract are being constructed, I should like the Engineer-in-Chief's decision as to the kind of pitching, if any, which is to be put round the man-hole covers.

Twelve square yards of squared bluestone pitching were included in the schedule of quantities, which the contractors have priced at £50 per square yard. The quantity likely to be used if the whole of the man-holes are to be pitched will be 35 square yards, which, at schedule rates, will amount to £1,750.

Special bluestone concrete will answer the same purpose as bluestone pitchers, and will only cost—9 cubic yards, at 50s.—£22 10s.

The fair price for bluestone pitching is about 25s. per square yard, and, as the schedule rate is so much higher than the market rate, the question arises whether the pitching should not be omitted. If, however, this course is considered to be unfair to the contractors, then only the quantity included in the schedule of quantities need be carried out.

J.D.

Mr. Hickson's minute thereon, and the recording by subordinate officers, reads as follows:—

We cannot in fairness omit an item for which, no doubt, the price is absurdly high, while we know that on other items the price is equally low. Where bluestone pitchers are shown on drawing, contractors must be paid for same at schedule rates.—R.R.P.H., 11/5/94.

Mr. Millner to note.—J.D., 11/5/94. Noted.—W.J.M., 14/5/94. Mr. Davis. File.—J.D., 15/5/94. (e)

(e) The Department's estimate of quantities, taken from the schedule, is 12 square yards. Mr. Hickson's minute G. Christie. practically authorises payment only for that quantity, which would have equally a cost of £600. There is no further written evidence of authorisation of the use of any additional quantity beyond the 12 square yards at this excessive rate of £50 per square yard, excepting that the officers signed the progress certificates. 12 Aug., 1896.

(f) These certificates show that the contractors were paid for bluestone pitchers under item 36 as follows —

| Date.    | Certificate No. | Quantity to date. | Amount. |    |    |
|----------|-----------------|-------------------|---------|----|----|
|          |                 |                   | £       | s. | d. |
| 23/7/94  | 6               | 5                 | 250     | 0  | 0  |
| 7/8/94   | 7               | 6                 | 300     | 0  | 0  |
| 21/9/94  | 8               | 9                 | 450     | 0  | 0  |
| 23/10/94 | 9               | 9                 | 450     | 0  | 0  |
| 19/11/94 | 10              | 9                 | 450     | 0  | 0  |
| 17/12/94 | 11              | 10                | 500     | 0  | 0  |
| 22/1/95  | 12              | 16                | 800     | 0  | 0  |
| 20/2/95  | 13              | 16                | 800     | 0  | 0  |
| 19/3/95  | 14              | 17                | 850     | 0  | 0  |
| 20/5/95  | 15              | 21                | 1,050   | 0  | 0  |
| 4/7/95   | 16              | 22                | 1,100   | 0  | 0  |
| 16/10/95 | 17              | 36·45             | 1,822   | 10 | 0  |
| 23/10/95 | Final.          | 36·50             | 1,825   | 0  | 0  |

(g) The above certificates were signed by the following officers, viz. :—Mr. Hickson, as head of Department, signed Nos. 6 to 14, inclusive; Mr. Bagge, as Chief Assistant Engineer, signed Nos. 6 to 13, inclusive; Mr. Davis, as Supervising Engineer, signed Nos. 6 to 14, inclusive; Mr. Griffiths, as Supervising Engineer, signed Nos. 15 to 17, inclusive; Mr. Milner, as Resident Engineer, signed Nos. 6 to 9 and 11 to 14, inclusive; Mr. Gibbes, as Resident Engineer, signed Nos. 15 to 17 and final certificate; Mr. Smail, as head of Department, signed No. 15; Mr. Darley, as head of Department, signed Nos. 16 and 17 and final certificate.

GEO. C.

12426. In conjunction with that report, I will ask you to read clauses 16 and 17 of the specification. You will find them upon page 116 of the Parliamentary papers? Yes—they are as follows:—

*Extra Works—Omissions of Works.*

16. If at any time whilst the works are in hand it shall be deemed expedient by the Engineer to order material or work of a different description to that specified, or to increase or diminish the dimensions or extent of any works to be done under this contract, or to alter their situation or vary the form or dimensions of any of the said works, or of any part thereof, or to make any deviation or to substitute one class of work for another, he shall have full power to do so, and to order and direct any such increase, diminution, alteration, deviation, or substitution: and the works involved in any such increase, alteration, deviation, or substitution, shall be executed by the contractor, if of the class of works provided for in the schedule of prices, at such schedule prices; and no such increase, diminution, alteration, deviation, or substitution of work, shall in any way annul or set aside this contract, or extend the time for the completion thereof, unless the Minister shall see fit to grant such extension; but such additions or alterations shall be measured and paid for, or deducted from the contractor's account, as the case may require, according to the schedule of prices. Provided that if any portion of the works so ordered to be done shall not be, in the opinion of the Engineer, of the same value or class of works provided for in the schedule of prices, the same shall be executed by the contractor at such prices as may be agreed upon with the Engineer; but, if the contractor and Engineer cannot agree as to the price to be paid, the Engineer may order and direct the same to be done by such person or persons as he may think fit. Before any extra work, or work of an altered value or class, is undertaken by the contractor, it shall be imperative for him to procure an order in writing from the Engineer for carrying out such extra or variation of work, and the contractor shall not be entitled to any payment for such extras or variations unless he produce the written order for the same, as aforesaid, and he shall not be entitled to plead that the Engineer omitted to give such written order, as it is to be distinctly understood that the onus of obtaining such order shall be on the contractor. The contractor shall not be entitled to any other rate than the schedule rate on any plea that the work was in a different position or of a different class from, or in a more difficult position than, that shown on plan or specification, or carried out under circumstances not contemplated in the specification, unless an agreement entitling him to payment by other than the schedule rates shall have been previously made and signed by the Engineer and the contractor.

*Valuation of Omissions.*

17. The Engineer shall have the power to direct the omission of the carrying out of any part or parts of the said works, but not amounting to the omission of the whole; and the value of such work so omitted in such case, calculated at the schedule rates, or, in the event of there being no schedule rates, calculated on the basis of the proportionate value which such work bears to the lump sum, as ascertained by the Engineer, whose decision on that point shall be final, shall be deducted from the contract sum, subject, however, to arbitration clauses Nos. 36 to 41.

12427. You have prepared a report having reference to the final certificate in Contract 69 exceeding the tender by £9,113? Yes; it is as follows:—

MEMO. NO. 18.

*Re the Final Certificate in Contract 69 exceeding the Tender by £9,113.*

THE aggregate amount of Messrs. Carter, Gummow, & Co.'s tender was £45,207 3s. 11d. The amount of the final certificate was, however, £54,320 7s. 7d., being an additional sum of £9,113 3s. 8d.

The departmental records having reference to the reporting of this excess to the Minister, from time to time, were not included in the papers laid before Parliament. From these records (which are enumerated in Memo. 13), it would appear that three separate applications were made for Ministerial sanction, viz. :—

On 4/6/95, to pass £2,634 13s. 4d.

On 12/7/95, to pass an increased amount, making the total £6,162 16s. 1d.

And on 29/10/95 (after the date of the Parliamentary Return), to pass a further increased amount, to make a total in all of £9,100.

The reasons stated in the various applications for the Minister's sanction are that the excess on the original estimate was due to the ground turning out different to what was contemplated.

GEO. C.

12428. *Mr. Davis.*] As to the retention money. Will you turn to page 120 of the Parliamentary return and read the last paragraph of clause 34? Yes; it says, "The like liability also shall hold as to the obligation of the contractor in the event of any advance being made to him from the retention money or on material on the ground and not *in situ*."

12429. What would you conclude from that—would you not conclude that the return of retention money together with an advance of material on the ground is contemplated? Yes; provision appears to be made for that.

12430. So that supposing the retention money were returned, and that an advance were made on material, that would not nullify the contract? I have not said that it would do so.

12431. Will you now turn to page 118 and read clause 27? Yes; it is as follows:—

*Conditions not to be waived.*

27. None of the conditions of this contract shall be varied, waived, and discharged, or released either at law or in equity, unless by the express consent of the Minister, testified in writing under his hand.

12432.

G. Christie. 12432. It would therefore appear that, even supposing the return of the retention money were not contemplated in the contract at all, and an advance were made on material, and sureties accepted in lieu of cash deposit, the Minister under his hand has power to waive the contract in any respect? That clause supports the contention that any alteration should have had Ministerial sanction, which does not appear.

12 Aug., 1896.

12433. To what do you now refer when you say that there was no Ministerial sanction? I mean Ministerial sanction to the consent of the sureties to the withdrawal of the retention money.

12434. But confine yourself to Ministerial authority—to what do you refer when you say that Ministerial authority was not given? To the authority allowing the sureties to approve of the withdrawal. You cannot show me, I think, any document where the Minister has approved of the sureties agreeing to the withdrawal of any of the retention money or to anything else of that kind.

12435. But has not the Minister absolute power to alter the conditions of the contract without any reference whatever to the sureties? No; I do not think so.

12436. Not under that clause? Certainly not.

12437. Coming to Holloway Bros.' letter, do you observe that that decision as to the request which Holloway Bros. made as to the acceptance of sureties in lieu of cash deposit is dated before it was decided to pay for the work upon Contract 69 by funded stock? I should say that if there were to be any alteration all the tenderers should have been informed. Holloway Bros. with the rest should have been informed of that alteration.

12438. But was there any alteration before the tenders were received? I am not aware of any.

12439. So that Holloway Bros.' case stands quite by itself, before the tenders were received? No. What I should say is this—that you altered the conditions of tendering without informing the whole of the tenderers.

12440. What I want to know is whether it is not a fact that Holloway Bros. sent in their letter before the tenders were received? When the first advertisement appeared.

12441. Have you found anything in the papers at all antagonistic to the decision arrived at with regard to Holloway Bros.' case before the tenders were received? I find this: that Holloway Bros. were refused a concession which Carter, Gummow, & Co. subsequently received, for what reason I am not prepared to say.

12442. That is not an answer to my question. I want to know whether there was any variation of the conditions of tendering before the receipt of the tenders. Were not all the tenderers treated precisely alike. Did they not all pay preliminary deposits? It seems to me that up to the time of receiving the tenders they were all treated alike. They all tendered upon the one condition.

12443. In spite of the decision of the Minister, Holloway Bros. put in a tender for this particular work? Yes; understanding that no one could get such a concession as that for which they had asked.

12444. That is your own conclusion? Yes.

12445. Coming now to the next point—have you not gathered from the papers that the reason why sureties were accepted in Carter, Gummow, & Co.'s case, and also in connection with similar contracts, was that they requested to be paid by Funded Stock? What I gather from the papers is this—that the Department wanted to make certain conditions with Carter, Gummow, & Co. They accepted the contract, taking it, I suppose, that it was to their own interest to do so, and they then got other concessions. The concession in favour of the Department does not amount to much as regards the Funded Stock. Even supposing they sold at 2 per cent. discount, it would not amount to a very large sum of money.

12446. *Mr. Norrie.*] Not 2 per cent. upon £45,000? The security should not be jeopardised even for 2 per cent.; but we know what was done in that matter. The loss did not amount to much.

12447. *Mr. Davis.*] Will you now read paper No. 2 on page 6? Yes; it is as follows:—

Department of Public Works, Roads and Bridges and Sewerage Branch, Sydney, 7 November, 1893.

*Minute Paper.*

*Subject: Main Eastern Branch Sewer.*

I FIND it will be quite impossible to be ready for inviting tenders for this work on the 15th instant. Specifications and plans on which tenders were to be invited are over two years old, and since that time considerable modifications and alterations in our sewerage plans have been suggested. The work is of too important a nature to rush through without full consideration. I therefore recommend that the time for the receipt of tenders be postponed till 13th December.

ROBT. HICKSON.

Extend time.—J.B., 7/11/93. Mr. Mitchell. Noted, *Gazette* and papers.—7/11/93. Approved.—W.J.L., 14/11/93. Roads.—D.C.M'L. (*pro* U.S.), B.C., 15/11/93.

PUBLIC WORKS DEPARTMENT.—SEWERAGE BRANCH.

Construction of Eastern Main Branch Sewer, Western Suburbs Sewerage.—Contract No. 69, Sydney Sewerage Works.

HEREWITH is submitted for the approval of the Commissioner and Engineer-in-Chief, plans and specifications, in triplicate, for the above work.

Amount available, provided for in vote, £830,000, for Western Suburbs Drainage, Loans Act, 53 Vic. No. 23.

Estimated cost—£64,420 6s. 5d.

Plans and specifications to be exhibited at the Sewerage Office, Public Works Department.

Tenders to close at 11 a.m., Wednesday, 13th December, 1893,

The Commissioner and Engineer-in-Chief.

C. H. OHLFSEN BAGGÉ,  
Chief Assistant Engineer for Sewerage.

HEREWITH is forwarded for the approval of the Secretary for Public Works, and for insertion in the *Government Gazette* and local papers, an advertisement inviting tenders for the above.

The Under Secretary, B.C.

ROBT. HICKSON,  
Commissioner and Engineer-in-Chief for Sewerage.

Department of Public Works, Roads and Bridges Branch, Sydney, November, 1893.

TENDERS will be received up to 11 o'clock a.m. on Wednesday, 13th December, 1893, for the construction of Eastern Main Branch Sewer, Western Suburbs Sewerage Works, Contract No. 69, Sydney Sewerage.

Tenders to be addressed to the Sewerage Office, Sydney, where specifications, &c., may be seen.

12448. It would appear from that that Mr. Hickson seemed very anxious that the very best should be done in respect to that particular contract? It is shown that a week before that he wrote a minute in connection with the tendering upon the old plan. I do not think he is entitled to any credit at all in the matter, because he ought not to have submitted the first plan. 12449.

12449. *Mr. Carter.*] Having noticed that the tenders in the first instance were based upon cash payments, and that an arrangement was afterwards made under which we were paid in funded stock, do you not think it would have been a fair thing to put that in your report? I have no wish to be at all unfair; I think I have been absolutely fair in the matter. I stated that there were special conditions. The papers are there, and speak for themselves. G. Christie.  
12 Aug., 1896.

12450. But knowing that the circumstances were as I now state them, do you not think it would have been fair to mention it in your report? I have mentioned it.

12451. Will you read the paragraph? Yes. I say, "The acceptance of Carter, Gummow, & Co's. tender was notified by letter from the Under Secretary, on 27th December, 1893. This letter contains two special conditions—first, that the contractors are to accept funded stock in payment, and, second, that the Secretary for Public Works is willing, in response to your verbal request, to accept two approved bondsmen in the sum of £4,520."

12452. Is that a fair way of putting it? I thought so.

12453. *Mr. Parkes.*] Mr. Davis has asked you to read various clauses of the specification. I will now ask you to read clause 30, of page 119, of the Parliamentary return? Yes. It is as follows:—

*Payments.*

30. Progress payments may be made once in every month, unless the same shall become not payable by reason of anything contained in these conditions, on the certificate of the Engineer, as the work proceeds, in the proportion of 80 per cent. of the value of the work returned, until the sum retained reaches the amount of the deposit provided for in the preceding clause, when no further deductions will be made. The amount of the retention money will be held by the Minister, in addition to the cash security, unless otherwise provided for in the specification, until the Engineer has certified that the whole of the works have been satisfactorily completed, and the period specified for the maintenance of the said works has expired, and all accounts finally adjusted; when the retention money, in addition to the cash security, will be paid to the contractor; and it is expressly declared that until a certificate has been given by the Engineer to the Minister that the work done by the contractor has been executed and completed to his satisfaction the contractor shall have no right or claim in respect of any work done or materials provided, nor to the payments from time to time to be made under this contract, or to the final payment upon the whole of the works being finished.

Thomas Griffiths recalled and further examined:—

12454. *Mr. Parkes.*] Were you in charge of Contract 69 as Supervising Engineer? Yes, for part of the time. T. Griffiths.  
12 Aug., 1896.

12455. For what portion of the time? From early in April, 1895.

12456. Could you tell me on what date all the tunnel excavation was completed on Contract 69? No.

12457. Was it finished before April? Yes.

12458. Then as to the certificate which was paid upon 4th April, and which showed in connection with the tunnel work 13,294 cubic yards of excavation, how could that be increased between that date and the date of the final certificate by over 1,000 yards? I presume that the first voucher you refer to would be a progress voucher. We never measure up exactly for progress vouchers. They merely represent the payment of something on account. The final voucher would give the adjusted account. May I also say that all the final vouchers are afterwards checked in the office.

12459. Would the item of 14,373 yards be the total of the excavation? I could not say from memory.

12460. Will you now turn to page 76 of the Parliamentary papers, and look at the items 5 to 11, at 27s. 6d.;—there would be an excess on that excavation of something like 4,900 yards? Yes.

12461. How was that made up? That was before my time. I had nothing to do with that.

12462. Then only Mr. Davis can give us evidence on that point? Yes.

12463. Turn now to the item of £50 for bluestone pitchers; can you give us any particulars in regard to that? No; I do not think I can, further than this: that they were fixed according to the plan.

12464. Will you take the site plan and point out where they are situated? There are no pitchers at shaft No. 1; it is on resumed land. With the exception of a shaft in, I think, Sydenham Road the whole of the remaining shafts have pitchers. There would be altogether, I think, about thirty-four.

12465. What is the size of the manhole covers? When the cover is open for a man to get down it is about 22 inches across.

12466. What is the rim? That would make it wider, of course.

12467. What about the bluestone round it—that is about 4 inches? No; it is 9 inches wide.

12468. I presume that in the total of these manholes there would be about 12 yards of bluestone pitching? There would be 1.23 yards to each manhole.

12469. That would not come to the total of 38 yards? It all depends upon the number. If there were, say, thirty-four manholes, I should say that it would come to 38 yards, because there is over a yard to each manhole.

12470. Does the price not appear to you to be enormous? Yes, it does.

12471. In adjusting the contract when paying the final voucher, do you not think it would have been a fair thing to give an equitable figure for any excess quantity not provided for in the contract? I saw it was a big price, but I saw also that in some cases we had exceeded the office estimate upon items where Carter, Gummow, & Co. had very low prices. In timber, for instance, I think the item ran into nearly 1,000 feet more than the office estimate. The price they had was 1d. per cubic foot.

12472. How did there come to be that 1,000 feet more? I am speaking from memory. I think the estimate was 9,000 cubic feet at 1d., and we actually used and paid for 9,818. I think we paid about £40, and the timber would have been worth from £1,200 to £1,500.

12473. What about the excavation in the shafts? So far as excavation is concerned, if you look at the excavation in the road surfaces you will find that they had 9d. a yard, and I think the work would cost about 3s. 6d.

12474. They anticipated that, I presume? I do not suppose they expected to lose 2s. 9d. per yard.

12475. You did not do as much of road surface excavation as is given in the schedule, did you? Very nearly; there is only the difference between 19,230 and 19,320 yards. I may mention that the excavation I supervised was in connection with the syphon.

12476. The certificate which you signed in April would be the first certificate you signed? Yes; I know nothing about the work prior to that.

12477. As to the shaft at Premier-street, the ironwork was done away with, was it not? There was an altered design there; but there is, nevertheless, a lot of ironwork fixed in the Premier-street shaft.

- T. Griffiths.  
12 Aug., 1896.
12478. But, as regards the top of the shaft, it was not left open with an iron hand-rail round it? No.
12479. But you will notice that that ironwork is paid for in item 73? Yes; the ironwork was on the ground before the Department had definitely decided what it would do.
12480. What became of the ironwork? It is stored at our depôt at Liberty-street, Newtown. I saw it a few days ago.
12481. But fixing is included in the item to which I refer? I cannot speak as to that from memory.
12482. Does not the schedule say "providing and fixing"? I expect so. As a matter of fact, there is not much work in fixing, and the iron had to be carted from 2 or 3 miles away. I suppose the carting would almost cover the cost of fixing.
12483. Would it be part of the £50 which was supposed to be saved. I could not say.
12484. Was the sewer rendered throughout? No.
12485. What portions were not rendered? The arch was not rendered.
12486. Do you know what became of the material from the excavation which was not used in packing? As I have said, until that part of the work was almost finished, I had nothing to do with that contract.
12487. The material had been disposed of before you went there? Yes; I think the municipality took a great deal of it.
12488. Is the section of the single sewer which was substituted for the double sewer the largest section of sewer in this work? Yes.
12489. Eight by seven, therefore, would be the largest section? Yes.
12490. How far does that run? To the Illawarra Road—about 8 chains, I think.
12491. What is the next section? That is not constructed.
12492. What is the size of the northern branch? 5 ft. 6 in. by 4 ft. 6 in.
12493. And what is the size of the eastern branch? 6 ft. 8 in. by 5 ft. 8 in.
12494. What is the smallest sized sewer upon the contract? 4 ft. 6 in. by 3 ft. 6 in.
12495. Was Mr. Millner the officer who preceded you? I took Mr. Davis's place.
12496. *His Honor.*] Was there any question for Mr. Darley to settle as to the substitution of concrete for bluestone pitchers round some of the shafts where bluestone pitchers were not shown on the drawing? No, I think not. I can only remember one case where there was none, and that was on resumed land, where there would be no necessity for pitching.
12497. *Mr. Parkes.*] Where was all the freestone pitching to go? It was to go round the top of the shaft in the original design. There was a sort of coping to the shaft, and the railings had to be let into it.
12498. There were 38 yards, we are told? It must have been a contingent item, I think.
12499. *His Honor.*] What was used at Premier-street? That is on land which is not occupied. There was no necessity to put any pitchers there, because there is no traffic, the surface being grassed.
12500. *Mr. Parkes.*] Was Mr. Gibbs upon this job all through? No; only during the time I was on it.
12501. *Mr. Davis.*] You have had a good deal of experience in connection with tendering since you have been in the colony? Yes; under the Water and Sewerage Board.
12502. What, briefly, has been your experience as to the way in which contractors have sent in their schedules? Well, they have sent them in in various ways, and at last it got to be so bad that we had to alter the system.
12503. What was so bad? The method of tendering. In one case, for instance, we had rock at  $\frac{1}{4}$ d. a yard in excavation, and I think, in the same tender, the soil was given at 10s.
12504. *His Honor.*] Whose tender was that? That was at the Glebe. In another case we had the same items at 2d. and 3d. a yard, and at 9s. 6d. The tenders were those of Williams & Co. and Butcher Bros.
12505. *Mr. Davis.*] The rigging of the tenders got to be so bad that after you had tried several ways of checkmating the contractors, you had, finally, to alter the whole system? Yes; we altered it about the same time that you made an alteration. I think that, if anything, we might have been a contract or so before you.
12506. The object of altering the system of tendering was to do away with speculative prices? Yes; to prevent the rigging of the schedules.
12507. Did the Board allow any of the tenders to be altered after they were received? No.
12508. They were either accepted or not? Yes; the lowest tender was accepted—in fact, I cannot think of a single case in which it was not accepted.
12509. You did not reject a tender because the prices were in some instances absurdly low, and in some instances absurdly high, without any apparent reason? No; each tender would be reported on, the schedule would be examined, and the lump sum would be noted against each name. The tender which happened to come out the lowest would be recommended for acceptance.
12510. Were all the tenders you received from contractors affected to a greater or lesser degree in the way you have described? Not at first, but latterly they nearly all seemed to get into one groove and acted accordingly.
12511. You had some experience before you came to the Colony in connection with contracting? Yes; in Wales. I was a contractor's engineer there for ten years.
12512. Do you know whether the same practice was in vogue there among contractors? Yes; as far as I can see it seems to be about the same all the world over.
12513. Can you give His Honor any instances from your own experience? It is rather difficult to remember them at a moment's notice, but I do remember one case which affords a very good illustration. It was the last contract of which I had charge in the old country. We had to construct a large reservoir for the Cardiff Corporation. The first item in the schedule was clearing the site of the reservoir of all vegetation. It was clearly specified, and to the best of my knowledge—I will not swear to it—we put down a sum of £5,000, the work being honestly worth about £500. I might say, in explanation, that we had about £20,000 worth of plant on the ground and we had also to deposit 10 per cent. on our tender of £100,000, so that there was ample security as far as the Cardiff Corporation were concerned. Another instance I remember was in connection with the waterworks we constructed at Aberavon. In that case we had local knowledge which other persons had not. We knew of a site for a puddle-field right alongside the work, that is—within 200 yards of the embankment. We put in a good price for that item because we knew that everyone else thought that the puddle would have to be brought from 6 or 7 miles away. The land, as is generally the case where waterworks are constructed, was pretty hilly, and it would be supposed, as a consequence, that the cartage would be very heavy. I think we got something like 5s. 6d. per yard for puddle, whereas it cost us about 1s. 2d.

12514. In other words, your principals had knowledge which other contractors had not, and they turned that knowledge to account? Yes. I know of one firm in particular who spent hundreds of pounds in preparing their tenders. They sent a man to explore the country for weeks, with the object of preparing a tender to the best advantage. T. Griffiths.  
12 Aug., 1896.

12515. *Mr. Carter.*] Taking into consideration the fact that Contract 69 was finished entirely to your satisfaction, as far as workmanship is concerned, could you possibly object to paying us upon the items in the schedule? No.

12516. Have you known such a thing to be done anywhere? No; not when once the tender has been accepted.

12517. Referring to the bluestone pitchers, are you sure that no more than the actual number shown upon the plan had been paid for? I am certain of that.

12518. As to the fixing of the ironwork in the Premier-street shaft, from 10s. to £1 would be a fair thing to allow, I suppose? Yes. It seemed a light bit of work, and the cartage to the dépôt would about cover it.

12519. *Mr. Parkes.*] Do you not see clearly that if you had carried out the conditions of your own contract, and had abided by your own schedule, these things could not have occurred? I did not prepare the schedule.

12520. But at the heading of your quantities you have these words, "probable quantities." Why cannot you fix something fairly approximate instead of, for instance, subsequently altering the quantities, and substituting blasting for guttering and gadding, and that kind of thing—why not prepare the work more accurately in the first instance? I had nothing to do with that.

12521. If that were done, would it not prevent the rigging of the schedules? You cannot foresee everything in works of this kind.

12522. Take the schedule for Contract 79, do you not think that as regards the guttering and gadding it is framed in such a way as to invite contractors to rig their schedules? I do not see that. When a man prepares his tender he puts so much on or takes so much off the Departmental rate.

12523. But the percentage system will not help you in the matter. You ought to fix your quantities in some approximation to the work which you are going to carry out. If you are going to gutter and gad then gutter and gad; if you are going to blast, then blast? You cannot foresee the exact quantities in public works of this kind.

12524. But some contracts show that you can do so. In Contract 69 you had a clause allowing you to substitute one material for another, leaving it open to any contractor to get the best of you? I do not look at the matter in that light. I should like to know in what way the contractors could get the best of us from the existence of that clause.

12525. An engineer who makes up a schedule has it in his power to prevent contractors from rigging their tenders, has he not? We do our best, of course.

12526. But is it not in the power of an engineer to prevent the rigging of tenders? It does not matter what engineer happens to prepare a contract, you will find that contractors will rig their schedules.

12527. Could not a conscientious engineer save the State money? I could not have saved a penny in this case; I looked after the work to the best of my knowledge.

12528. *His Honor.*] Had you anything to do with the acceptance of tenders? No.

12529. Can you say whether if a tender were drawn up, as Mr Parkes suggests, containing prices more absurd—four or five times as absurd if you like—than £50 a yard for bluestone pitching, it would be the regular custom to throw that tender out? I do not know what has been the practice with the Public Works Department. I had nothing to do with it in any shape or form up to twelve months ago.

12530. You have had nothing to do with the accepting or rejecting of tenders anywhere else? No; except, as I have explained, that I was a contractor's engineer for ten years.

12531. You are only speaking from your experience on the contracting side—not on the accepting side? Yes; I have given you instances of how contractors at home rig their schedules. I know, from my own experience, that the prices put in are sometimes absurd. I know that, in connection with the Board of Water Supply and Sewerage, the prices received were sometimes absurd. I have given you instances of that already.

12532. But the question is, what extent of absurdity in price would justify the rejection of a tender? That is a matter for the Board to say. The matter was usually sent on to Mr. Smal, and it would be for him to make a recommendation.

12533. Have you ever known a tender to be thrown out for what may be called a superfluity of absurdity in rigging? No.

12534. *Mr. Parkes.*] In the case to which you have referred, where the price of a farthing a yard for excavation in rock was given, was any distinction drawn in the schedule between the excavation in hard and soft material? Yes; there were so many yards of rock and so many yards of soil.

12535. Were bores taken? We take no bores under the Board of Water Supply and Sewerage. We have comparatively shallow trenching. The contractors have to satisfy themselves as to the nature of the ground through which they go.

12536. They have to do that, you say? Yes. You will find that one man will have better local knowledge than another, and will rig his tender accordingly. The Glebe contract was one in point. There the tenderer had better local knowledge than had the Board's officer.

12537. You throw on to the contractor the responsibility of finding out the nature of the ground? Yes. Under the new system we tell them what we consider a fair price, and they put in a percentage above or below.

12538. If payments were allowed to be made upon specially selected items, as in the case of Contract 69, percentage tendering would not help you? In that case we should not put down a price of £50 a square yard for bluestone pitchers.

12539. But you are liable to make mistakes? Yes, but not absurd mistakes.

12540. Take Contracts 117 and No. 77—two contracts right against one another. You have put down excavation at £3 10s. in one case, and £1 18s. in the other? I did not put down those prices. I am not in any way responsible for them.

12541. After all does it not rest with an engineer to control the matter to see that work is carried out at a fair and reasonable rate? Yes.

12542. There is no doubt about that? No.

12543.

- T. Griffiths. 12543. If a tender is accepted, the work is presumed to be done for a certain amount of money;—there may be a little increase in quantities, but suppose there is an increase of 30 per cent., what would you say to that? You can never estimate the exact quantities in any public work when completed.
12544. But you ought to be prepared to go fairly and reasonably near the quantities? It all depends upon what you call reasonably near. I have had twenty years' experience in such matters, and I should be sorry to say that I could give the exact quantities that would be required in any work when completed.
12545. How is it that engineers outside of the Department can do so? I have never known a man outside of the Department to do so. Take the Manchester Ship Canal. Some of the best engineers in England estimated the Manchester Ship Canal to cost from 6 to 8 millions, whereas it cost from 13 to 14 millions. If men of that stamp can make mistakes, surely smaller fry may be expected to do so.
12546. But that would be in connection with water;—the engineers would have to deal with water coming in upon them? Yes. Take also the Panama Canal; that has ruined thousands of persons, although they have had the advice of De Lesseps and some of the most eminent engineers in the world.
12547. *His Honor.*] Is this your first experience of what you call percentage tendering? Yes; it has been in operation under the Board of Water Supply and Sewerage for about two years.
12548. Who started the idea first of all? I have an idea that it emanated from the Tender Board and Mr. Smail. I think Mr. Smail had something to do with it. I think the Board's tenders were first advertised in that way.
12549. You have not heard of the system in any other part of the world? No.
12550. From your experience as an engineer, what do you say about its expediency, as compared with the old schedule form of tendering? I think it prevents, to some extent, the rigging of schedules.
12551. You think it is an improvement? I think so. Of course, if I were speaking from the point of view of a contractor's engineer, I should probably say that it was not an improvement.
12552. But speaking from the public point of view? From that point of view, of course, it is an improvement.
12553. Was the system formerly adopted by the Works Department—the schedule system—generally adopted all over the world? Yes. In the old country, in the case of large contracts, the schedules are prepared, not by the engineer himself, but by a quantity surveyor. The surveyor would charge about 5 guineas for a schedule of quantities. The quantities are prepared to the best of the man's knowledge, and when the tender is accepted he gets a fee according to the size of the job. The contractor then fills in his prices. Each contractor can get a copy of the quantities by paying for it.
12554. Each tenderer tenders upon that schedule? Yes; that is the universal practice in the old country upon all big works.
12555. It has developed a system as remarkable for the rigging of schedules almost as that said to be adopted by solicitors in the making out of their bills of costs—possibly, even worse? Yes.
12556. You think, then, that the Department have now made a good departure? I think the present system is as near perfection as possible.
12557. *Mr. Carter.*] I suppose you know that outside of the Public Works Department all private engineer's work is carried out on the lump sum system? I cannot speak as to the outside practice.
12558. *Mr. Davis.*] Did it ever come to your knowledge that Mr. Hickson, as an official member of the Water and Sewerage Board, proposed the present system? I think that is how it came about; I think it was done through Mr. Hickson. I believe Mr. Smail recommended it to the Water and Sewerage Board, and I know that I received instructions to get all other tenders out in that form.
12559. You think that the idea may have originated with Mr. Hickson himself? I do not know; but I am pretty well certain that it came from Mr. Hickson and Mr. Smail. I do not know who originated it. I think the Board were the first to prepare a contract under the new system.
12560. *Mr. Parkes.*] Was the recommendation to which you refer in writing? I do not know for certain, but I believe the system was mentioned to Mr. Smail by Mr. Hickson. I remember Mr. Smail saying, "You see what a difficulty we are having with our tenders; it would be much better to have a system under which the contractors can tender at a percentage off or on."
12561. *His Honor.*] Had there been much talk in the Department about the rigging of tenders? Yes; Mr. Smail and I had had many chats about the matter.

---

FRIDAY, 14 AUGUST, 1896.

John Charleton Graham sworn and examined :—

- J. C. Graham. 12562. *Mr. Parkes.*] You work for Carter, Gummow, & Co.? Yes.
12563. Have you been working long with them? Eight or nine months.
- 14 Aug., 1896. 12564. Upon what works? None in particular. I have been doing anything they gave me to do.
12565. On what jobs have you been? On the Johnstone's Creek aqueduct from the Lillie Bridge side to the White's Creek side.
12566. Did you work on the aqueduct part of the contract? You mean on the arches—yes.
12567. Were you working there in January, 1896? I believe I was.
12568. Do you recollect on what part of the work you were then engaged? No.
12569. Were you then working on Contract 77 or on Contract 118? I do not know the numbers of the contracts, and I could not say for certain where I was working at that particular time.
12570. Where were you working generally? I did everything which was given me to do—pick and shovel work, or anything that was going.
12571. Were you concrete mixing? I sometimes did a little bit of that; at other times I was muck-shifting, and at other times wheeling the barrow.
12572. Have you done much concrete mixing? A good bit, off and on.
12573. Before you came to Carter, Gummow, & Co., had you done much concrete mixing? No.
12574. What quantity is it that is called a batch? I could not tell you; I never filled the boxes.
12575. Is a box-full a batch? I could not say. All I had to do with the concrete was to turn it over.
12576. How much stone goes to a batch? I could not tell you.
12577. Did you never hear the term used? No; I had nothing to do with the filling of the boxes, but I did the turning over sometimes. 12578.

J. C. Graham.

14 Aug., 1896.

12578. Were you engaged in concrete work in last June or July? I could not say.
12579. Do you remember what work you were then doing;—I mean in June and July of the present year? I could not say.
12580. Could you tell me the names of the men who worked at the concrete work on Carter, Gummow, & Co.'s jobs upon which you have been engaged? I do not know their proper names. I only know them by their nicknames, by the names by which they went on the job.
12581. Could you tell me some of them? It would be hard to do that.
12582. But you must surely remember the names of some of the men who are doing concrete work when you were mixing the concrete? There were so many of them.
12583. But tell us the names of some of them? Martin Byrnes was one of the men on the board. There was also a man they called Scroucher.
12584. Where is he working now? He was working over at White's Creek yesterday.
12585. He is still on the works? Yes.
12586. Can you give us the names of any of the others? There would be myself and Jack Kerwick. Those are all the names I can remember.
12587. Are all the men who are working on Contract 77 in June, still working there—I mean the men who were then doing concrete work? I think so as far as my knowledge goes.
12588. They have worked at it since June? I could not tell you.
12589. Did you do any of the concrete work at all in the case of the Johnstone's Creek aqueduct apart from concrete mixing? I was on the board throwing it on to the boards at the top, as it were.
12590. When you used bag cement on this job was it carried to the work in a cask? I never saw any bag cement used.
12591. Was no bag cement used on the job? Not to my knowledge.
12592. Is there any in the shed? There is some in the shed.
12593. How much? I could not tell you.
12594. Is there any cask cement there? There was some there.
12595. Is there any there now? I could not tell you that.
12596. Who was the inspector on the job? Clymer.
12597. Who is the foreman? Jack Cottle.
12598. Is Bandeen a foreman? He was.
12599. He is not on the job now? No.
12600. Where is he now? I could not tell you.
12601. Where did you last do any cement work upon the storm-water channel? That must have been before last Christmas.
12602. Do you remember when you came to Carter, Gummow, & Co.'s contract? Yes.
12603. On what date was that? I could not say to a certainty.
12604. About what month of last year was it? I think it must have been last October.
12605. What was your work then? I was wheeling metal.
12606. What sort of metal? White metal.
12607. Do you know where it came from? No.
12608. Did it come from a crusher? I could not tell you.
12609. Did you wheel it from a heap? Yes; it was a bit too far to shovel; we had to wheel it.
12610. Where was the board? On the ground.
12611. In what position was it in relation to the contract? It was about ten yards away.
12612. Who brought it down to the board? A carter.
12613. Who was it? I could not tell you.
12614. Do you not remember his name? No; I knew no one when I went on to the job. I could tell you the name of hardly anyone on the job for a certainty.
12615. Do you know whether the carter brought the stone from a crusher? That I could not tell you.
12616. How far away would the shed containing the cement be from where you were working when you were mixing the concrete? Sometimes it would be a quarter of a mile, and in other places, say, 50 yards.
12617. The cement would be carted to you? Yes.
12618. In casks? Yes; the casks were all branded.
12619. Do you know where the sand came from;—do you know anything about the sand? I could not tell you that.
12620. You do not know whether it was crushed sand-stone or not? No.
12621. Can you tell me whether Contract 118 is yet completed? I do not know whether you would call it completed, but there is no one working on it.
12622. When did they cease to work there? I could not tell you.
12623. Do you recollect when you last worked upon it recently? The last time I worked upon it was in connection with the flood-gates.
12624. On what date did they finish those? That I could not tell you.
12625. You cannot even remember the month? No.
12626. *Mr. Carter.*] Mr. Parkes has asked you a lot of questions regarding your duties on our contracts. As a matter of fact you were a general workman. You would be here to-day and at some other place to-morrow? Yes.
12627. You were on the concrete board when there was a vacancy and at other times you would be on the scaffolding or wheeling metal or doing anything that was necessary. You had no stated work? That is so.
12628. You were not a regular concrete hand? No.
12629. *His Honor.*] Was the stone you have spoken of stone which was ready broken when it was brought down? Yes.
12630. Broken for going into the concrete? Yes. If it was in any way large the inspector would have it broken with a little hammer.
12631. He would go over it? Yes. He would rake it over and if there were any big lumps in it he would have them broken. The inspector was always on the board, to my knowledge.

John Driscoll sworn and examined :—

- J. Driscoll.  
14 Aug., 1896.
12632. *Mr. Parkes.*] You work for Carter, Gummow, & Co.? Yes.  
12633. How long have you worked for them? About ten years, I think.  
12634. You have lately been working on the aqueduct contract? No.  
12635. Did you work in the storm-water channel? Yes; I was putting in concrete.  
12636. Were you doing that continuously? Yes.  
12637. When was the last concrete put into that work? I could not tell you.  
12638. Was any concrete put into it in June last? I could not say.  
12639. Was there any put in in March? I could not say.  
12640. *His Honor.*] You know, I suppose, about how long ago concrete work would be done there? No; I never took any interest in it.  
12641. *Mr. Parkes.*] How long ago is it since you were at work there putting in concrete? About six months ago.  
12642. Did you recollect when the concrete work was completed upon Contract 118? Yes.  
12643. When was it? I could not say when exactly.  
12644. Was the cement brought down to you? I had nothing to do with the cement. I had to put concrete in the ribs.  
12645. Did you mix the concrete? No; I never turned a shovelful of concrete.  
12646. Can you tell His Honor the names of some of the men who mixed the concrete there? No; I was a chain or two away from them, and I never went to the board. The men on the board would have to go on a different direction from me. I never went near them.  
12647. What was the size of the board? I could not say.  
12648. Was it 10 x 10? I could not say.  
12649. Was it shifted about? Yes.  
12650. To where you would be working? Yes.  
12651. Therefore it would be pretty close to you? It would always be about 2 chains away from where I was working.  
12652. Could you not see the men who were working on it? I had plenty to do myself without watching other men.  
12653. But you would observe the men who were working at the board? No; I never knew one of them.

George Rogers sworn and examined :—

- G. Rogers.  
14 Aug., 1896.
12654. *Mr. Parkes.*] What are you? I am a labourer.  
12655. You have been working for Carter, Gummow, & Co.? Yes.  
12656. For any length of time? About four years off and on.  
12657. On what jobs have you worked for them? At Shea's Creek, at Marrickville, and at Johnstone's Creek.  
12658. You worked on both contracts at Johnstone's Creek? Yes.  
12659. What has been your particular work? Taking out rock.  
12660. Did you ever do any concrete work? A little; not much.  
12661. Did you do any mixing? I did a little for a few days.  
12662. Where? At Johnstone's Creek.  
12663. At what date? I do not remember. It would be about the time we first started.  
12664. On what date did you start? I could not tell you that.  
12665. Did you ever have to carry cement? No.  
12666. How was the cement brought to you? On drays.  
12667. Do you recollect the names of the men who had charge of the drays? I do not.  
12668. Will you give me the names of some of the men who were mixing concrete at the same time that you were? There was Driscoll and a man named Moore.  
12669. Do you remember anyone else? No; I do not.  
12670. Can you think of no other name? No; I cannot remember any. There were so many coming and going.  
12671. Were there not regular men working on the board? No.  
12672. Do you know how many men were working on the contract altogether? No; I do not.  
12673. Did you go into the cement shed? No, I did not.  
12674. You have never been into the shed? No; I do not think so.  
12675. Can you tell me when the Johnstone's Bay contract was completed as far as concrete work is concerned—I mean the storm-water channel? I cannot tell you.  
12676. Not even to a month? It was in March, I think.  
12677. Is all the concrete work completed now? Yes.  
12678. It was all completed in March, you think? As far as I know.  
12679. When was it completed to the flood-gate? It was completed when I left on the 17th March, as far as I could see. Whether more work was done there afterwards, I could not say.  
12680. Where are you working now? At North Shore.  
12681. On one of Carter, Gummow, & Co.'s jobs there? Yes.  
12682. You say that when you left the Johnstone's Bay contract all the concrete work was finished? I should not like to swear that it was. I left the job on 17th March, and some work may have been done afterwards.  
12683. But the whole of the channel was complete? I did not notice; I cannot say positively.  
12684. You did not observe it? No.  
12685. Was the concrete work kept going continuously in that channel? No; it was stopped for some time.  
12686. Did it follow up the excavation? Pretty well.  
12687. It would be fairly continuous then? Yes.  
12688. Did you ever see the mixing of the concrete done? I saw some, but not much.  
12689. Will you describe the method adopted? The box is filled with stones; then water is put on to the stone; then so much sand is put on, and spread over the stone, and the cement is put on the top of the sand. That is turned over three or four times.  
12690.

G. Rogers.

14 Aug., 1896.

12690. Is there a gauge-box used? Yes.
12691. What is the size of gauge box? About a yard I suppose; I never saw it measured.
12692. You could not tell the exact size? No.
12693. What would be the depth of the box? I do not know.
12694. Could you not tell from observation? It might be 12 or 18 inches deep, or it might be more.
12695. How many of these boxes would be used in one mixture? Only one.
12696. Then the cement would be put upon the top of the stone and sand? Yes.
12697. Did you do any mixing upon Contract 77? You mean for the arches—no.
12698. Did you do any of the work in connection with the putting in of the concrete? No.
12699. Most of your work was rock work—excavating? Yes; most of the time I was working at the stone crusher.
12700. Where did the stone come from which went through the crusher? Out of the quarry at Annandale.
12701. On what job was that stone used? On the storm-water channel.
12702. And on the other job as well? I do not know if it was used on the other job, but I know that it was used on the storm-water channel.
12703. Did Carter, Gummow, & Co. use the sand which came from that crusher? Yes.
12704. Did they crush any of the stone which came out of the tunnel itself? I do not know.
12705. You did not notice that? No.
12706. Did you notice where the sand which was used in connection with Contract 118 came from? Some of it came from the crusher.
12707. Where did the rest come from? I think it all came from the crusher, but I cannot be certain. I was on the concrete board, and the crusher was half a mile away.
12708. Did you see any men carting the sand? It was taken in trucks to the concrete board.
12709. Do you not know whether any bag cement was used upon the contract at Johnstone's Creek? I did not see any. No bag cement was used when I was on the board.
12710. How did the casks come to you? In drays, as far as I remember.
12711. Who drove the drays? I could not tell you.
12712. How is the cement put on to the stone and sand? The cask is rolled up on to the top of the heap, and it is then chopped up with an axe, the cement being levelled over the heap.
12713. Was that done in every case? In every case I saw.
12714. Did you ever see any casks upturned on the heap? I did not see them.
12715. Did you ever see a bag discharged on to the heap? No; I never saw any bag cement used when I was at the board. It was all in casks.
12716. Was an inspector of the Department always standing over you? Yes; Lougheed.
12717. Who was the contractor's foreman? Bandeden.
12718. Did he stand over the board? He was generally on the board.
12719. Can you remember the names of some of the others who were working there with you? Only the three I have mentioned, who were turning with me.
12720. Can you think of any others? No others who were turning with me. Others would be at work near the board. There would be Murphy, for instance; but he is in Queensland.
12721. Any others? Yes; John FitzGibbons was, I think, another.
12722. Do you know where he is now? I think he is working for Carter, Gummow, & Co., at Annandale.
12723. Do you know the names of any of the others? Yes; there were Byrnes and Kady.
12724. Any others? I do not remember any others; but there were a great many more, if I could only call them to mind.
12725. Do you recollect the names of any men who left the job before you left? No; I remember some men being put off when the job was finished.
12726. Can you tell me the names of some of them? No; I do not think so. A number of them who were put off that job are now working at North Shore.
12727. But you could not tell us the names of any of them? No; I do not think I could.
12728. Can you not remember the names of any of those who have altogether left Carter, Gummow, & Co.'s works? No.
12729. In mixing the concrete, to what distance in the channel did you work? I could not tell you; I was a week turning the concrete.
12730. Do you remember the distance in the channel you went when you were doing that work? No, I do not.
12731. How many lots of concrete would you mix during the day? I suppose fifty or sixty, perhaps more.
12732. Would that quantity be placed in position? Yes.
12733. Did you notice the depth of the invert in the storm-water canal? No.
12734. How was it put in—were there any boards to keep back the earth? Yes; there were boards where necessary to prevent it from falling in.
12735. How was the concrete put in? It was run off the concrete board to another board from which it was tipped and put in its place.
12736. It would then be rammed in? Yes.
12737. Were there any sticks to indicate the thickness? Yes.
12738. Do you recollect what length those sticks were? No.
12739. You did not fix any concrete at all upon Contract 77? No.
12740. Can you tell me where you worked in January last;—upon what portion of the contract were you then working? I was working at the crusher at that time.
12741. Where were you working in February? At the Johnstone's Creek sewer.
12742. Mining? No; moving concrete then.
12743. Where would you be working in March? I should be doing the same thing.
12744. Wheeling concrete for the Johnston-street sewer? Yes.
12745. Would you be wheeling it during the whole of those two months? I think so, but I could not be sure.
12746. How far do you have to wheel it? Not very far—about 20 or 30 yards.
12747. In those two months you would have a good opportunity of seeing concrete made? No; I just emptied my barrow and went away for another.
- 12748.

- G. Rogers. 12748. But you would look on sometimes? I had no time for that.  
 12749. But your eyes would be about you? I had no time to notice others.  
 14 Aug., 1896. 12750. You can surely tell us the names of all the men who were working there? Where so many men are working on a job one is apt to forget names.  
 12751. Do you not know all the men on the job? I might know them if I met them, but I might not know their names.  
 12752. *Mr. Carter.*] You have said that Driscoll was working on the board—do you know whether he was working on the board or at the ribs;—do you remember that? He was working in the ribs.  
 12753. Not on the board? No; he was working on the ribs.  
 12754. You have not much time to straighten your back when you are on the concrete board? No.  
 12755. *Mr. Parkes.*] I presume you talk to the men who are on the work? No; we are not allowed to talk.  
 12756. *Mr. Carter.*] How long is it since you were mixing the concrete for the week to which you referred? It was about the time we started.  
 12757. And that would be twelve months ago? Yes.

---

Thomas Kady sworn and examined:—

- T. Kady. 12758. *Mr. Parkes.*] You worked on the concrete at Johnstone's Creek sometimes? Sometimes.  
 12759. At what time would that be? Whenever there was any need for it.  
 14 Aug., 1896. 12760. When you used bag cement on that job did you carry it to the works? A few bags were broken, and the contents of those bags were put into a couple of casks or so and carried on to the work.  
 12761. What time was that? I could not say. I did not take particular notice.  
 12762. Was it about March? Not that I know of.  
 12763. In what month was it? I could not tell you.  
 12764. Do you not recollect at about what date it was? No; I do not.  
 12765. Can you not recollect the month approximately? No; I never remember things of that sort.  
 12766. How did you fix up the casks—did you put the tops on again? Yes.  
 12767. Did you nail them down? No; they were just laid on.  
 12768. You did not nail them down then? No; the top was left open. There were only a few casks filled altogether.  
 12769. When you got the casks on to the job, what did you do with them then? I did not go to the job with the casks. I stopped in the shed.  
 12770. Do you recollect the date approximately on which that was done? No.  
 12771. You are sure of that? Certain of it.  
 12772. Do you not remember in about what month it was? No.  
 12773. When you sent bags down to the job were they broken on the top of the concrete? Yes, on the concrete board.  
 12774. You are sure the bags were broken there? Yes.  
 12775. How many bags go to a cask? Three bags.  
 12776. When was the floodgate on that job completed? I saw them working there up till Friday last, but the men did not belong to Carter, Gummow, & Co.  
 12777. When was the storm-water contract at Johnstone's Bay finished? I could not tell you.  
 12778. Cannot you recollect at all? No.  
 12779. You cannot recollect in about what month? I cannot.  
 12780. You cannot think of it at all? No.  
 12781. How much bag cement is there in store there now? I could not tell you. There are a good few hundred bags there.  
 12782. Five hundred? Yes, 1,500.  
 12783. How many casks? I could not tell you.  
 12784. A hundred? Yes, more.  
 12785. What is the size of the shed? I have never measured it.  
 12786. As to the mixing of concrete, what do they call a batch? It depends upon the stone. In some cases there are 16 feet, and in other cases 20 feet. Added to that there would be 8 feet of sand, and 4 feet of cement.  
 12787. What would be the 16 feet stone? Bluestone.  
 12788. How much of sand would that take? 8 feet.  
 12789. And how much cement? 4 feet.  
 12790. Then in the sandstone concrete, how much goes to the batch? 20 feet of stone, 8 feet of sand, and 4 feet of cement.  
 12791. To what size is bluestone broken on the Johnstone's Creek work? I have never gauged it.  
 12792. But you could tell by your eye pretty well, could you not? No, I could not tell you the size.  
 12793. What does the specification say? I do not know anything about that.  
 12794. What would be the largest stone roughly? I could not tell you.  
 12795. Would it be  $2\frac{1}{2}$  or 3 inches in the case of the bluestone? Nothing like that. It is small metal.  
 12796. In the case of the sandstone, what would be the largest stone? I could not tell you, I think it is supposed to be  $2\frac{1}{2}$ -inch.  
 12797. Roughly speaking, what would be the size of the largest stone? I could not tell you.  
 12798. Have you worked from the beginning to the end of Contract 118 at Johnstone's Creek? Yes.  
 12799. How long have you worked for Carter, Gummow, & Co.? I have been working for some of the company a good few years. I worked for some of the company before Carter and Gummow came into it.  
 12800. You have a superior position as compared with the ordinary men? No.  
 12801. What wages are you getting? Eight shillings.  
 12802. Can you give me the names of the men who have been working on the concrete board, as a general thing? Some of the men who worked there I have never known. I was not always on the concrete board; I was off and on.  
 12803. Where did you work particularly? I took out some of the excavation, and I was also a good part of the time at the crusher.

T. Kady.

14 Aug., 1896.

12804. What did you do at the crusher? I filled the trucks from the crusher.
12805. Do you know the names of the men who were feeding the crusher? No; they were strangers to me.
12806. Where did the stone which went into the crusher come from? I could not say.
12807. Did any of it come out of the excavation? Not that I know of.
12808. Can you tell me the names of any of the men who have lately left this work? I cannot. You might be there months before you took any notice of a man's name, unless you happened to hear it called out at the office on pay-day.
12809. Did you do any work upon the aqueduct in Contract 77? I do not know what you mean by aqueduct.
12810. Did you never hear the word in your life before? No; if you mean the arches, I was working there.
12811. What was the mixing of the concrete in that case—what went to the batch? Twelve feet of stone, 6 feet of sand, and 4 feet of cement. One cask of cement went to the batch.
12812. Did you see the cask broken on the concrete? Yes.
12813. Will you swear that? Yes.
12814. Where was that concrete carried to? It was taken up on to the carriers.
12815. Where was it put? Into the sewer.
12816. Into what part of the sewer? Into the invert.
12817. Do you mean into the sides? Yes.
12818. Was it rammed? Yes.
12819. Was it well rammed? Yes.
12820. Was any bag cement put into that work? No.
12821. Is the whole of the material wheeled in a barrow? Yes.
12822. It is not pulled up in buckets and put into the work with spoons? No; the barrow was pulled up by a horse. In some cases it was wheeled straight on to the work.
12823. Where did they get the sand to mix with the material which went into the arches? I think it was obtained from North Sydney.
12824. Who brought it on to the works? That I could not tell you.
12825. Where did they get the sand which went into what you call the invert? That was North Sydney sand, I think; but I could not say where we got the sand from.
12826. Did you ever take any sand from the crusher for this work? Not for the arches.
12827. Where was that sand used? In the storm-water channel.
12828. Was any of it used in the piers? Not that I know of; I was not working on the piers.
12829. Who was the foreman at Johnstone's Creek? A man named Bandeden.
12830. Was the Government inspector's name Loughheed? It might be; I never inquired his name.
12831. Did you do much concrete mixing for the aqueduct work? No.
12832. How much did you do? I could not tell you.
12833. How long were you at it? I was there a few days when they were doing the work.
12834. Did you shift from one part of the work to another while the work was being done? Not while the Johnstone's Creek work was going on. When that was finished, I went for some days on to other jobs, and so on.
12835. Have you seen the concrete mixed on the Johnstone's Creek job? I have seen some of it mixed.
12836. Is it not the fact that two batches of stone were used to one cask of cement? Not that I am aware of.
12837. But think distinctly about it? It was not done that I am aware of.
12838. You are sure of that? Certain of it.
12839. You never saw such a thing done? No.
12840. Did you ever mix concrete yourself? Yes; I have mixed a lot of concrete.
12841. *Mr. Carter.*] As to the broken bags of cement, how many, roughly, were there—were there forty or fifty? I do not think there were that number. There might have been about twenty. I sewed up some of the broken bags.
12842. But some of them were too bad to be sewn? Yes.
12843. So that there was no other practicable means of taking the cement down to the board except by putting it into casks? No.
12844. How many bags did you sew up? A good few.
12845. *Mr. Parkes.*] Do you know a man named Moore who worked on this job? I have heard of him.
12846. What did he do? The last time I saw him he was working at the muck.
12847. At what time was that? When we were taking out the excavation.
12848. In about what month? I could not tell you.
12849. You cannot recollect dates? No.
12850. *His Honor.*] What time of year was it—was it summer or winter? I think it was in the summer.
12851. *Mr. Parkes.*] Do you remember distinctly a man named Moore—are you sure the man you are thinking of was named Moore? God only knows; I do not.
12852. Is he still working on the job? No.
12853. Has he left it? Yes.
12854. Long ago? Over six months, anyhow.
12855. Where was this man working six months ago—was he working on the muck then? Yes; the last time I saw him.
12856. Was the muck being taken out about six months ago? Yes. I left Johnstone's Creek at that time and went to work on the piers and arches.
12857. When did Moore leave? I do not know.
12858. You are sure he is not still working on the job? I do not think so.
12859. You think he has left Carter, Gummow, & Co.'s employ? I think so.
12860. Do you know where he has gone to? He may have gone to Western Australia for aught I know?

John Carter recalled and further examined :—

- J. Carter.  
14 Aug., 1896.
12861. *Mr. Parkes.*] The last pay-sheet entered in your book is dated 21st May, 1896? Yes.
12862. Are all the men included in that sheet all the men working on the job? All those men were working on the job when that pay-sheet was made out.
12863. Would there be any others? Not necessarily. One might be omitted, but there would not be more than one or so omitted.
12864. Have you shifted any from this job to North Shore? Yes; we shift them about. They get work if there is work to be given. The North Shore work is different from other work. It is excavation. There are plenty of men who are not fit for excavation.
12865. Taking the pay-sheet under date of 21st May, 1896, all the men included in that sheet were working on that date? Yes.
12866. And the inference would be that men whose names did not appear in that pay-sheet would have left the works? Yes. It does not mean that they have necessarily left our employment.
12867. But some of them would have done so? Yes, a few.
12868. Where would those who have not left your employment have gone? To North Shore.
12869. Can you give us the names of any of those who have been transferred from North Shore? Yes; Bandeen is one.
12870. When did he go to North Shore? At the commencement of the contract—say, four or five months ago.
12871. Are there any others? Yes; Driscoll, Rogers, Kerwick, Davidson, M'Lellan, M'Quirk. Galvin has gone to Coolgardie.
12872. When did he leave? I could not tell you.
12873. The pay-book would show? Yes, I dare say it would. If his name did not appear in one pay-sheet he would probably have left between that date, and the date of the preceding pay-sheet.
12874. You say he is gone to Coolgardie? I could not say definitely where he is gone. Some of them go up on to the rivers cane-cutting.
12875. Galvin was working up to what date? Up to 7th May, 1896, according to the pay-sheets.
12876. Has he been working for you since? He may have been working at North Shore for aught I know.
12877. How long was Moore with you before he left? He is an old sewerage hand.
12878. How long had Galvin been working with you before he left? He was another old employé. Some of them were employed by members of the Company ten years ago; before I was in the firm at all.
12879. Kady has been a long time with you? Yes; ten or twelve years, I expect.
12880. Could you tell me the names of any other men who have lately been sent off your works? No; I do not send them off at all. I see their names in the sheet on pay-day. That is all I know of them.
12881. But you would hear of their being removed? That is no part of the firm's business. The ganger removes the men. We do not interfere with the men. They go to the office and get their pay, and that is all we know about it.
12882. Can you tell me when you completed the Johnstone's Bay sewer? I am not sure that it is completed yet.
12883. There is some concrete work to be done there? There may be. It has not been finally measured up. Practically, however, the job was finished some months ago.
12884. Were you not putting in concrete there in March? We might have been.
12885. You were not finished down to the tramline in March? Yes.
12886. Was the concrete completed? We were working the other way.
12887. From the bay upwards? Yes.
12888. What were you doing there last March? I have not the faintest idea. We were concreting and rendering I suppose.

Joseph Davis recalled and further examined :—

- J. Davis.  
14 Aug., 1896.
12889. *Mr. Parkes.*] Mr. Hickson, in his minute in reference to Contract 69, says there was a saving of £750 made upon the alteration from a double sewer to a single sewer. That is the 10 chains running from Premier-street to the Illawarra Road? Yes. Mr. Hickson, in his minute, says, "This addition is caused by an alteration in the original design, which has the effect of reducing the cost of the work in this contract by about £750. There is a further reduction on the whole work of £10,000. Recommended for approval."
12890. If you turn to the comparative estimates which appear upon pages 130 and 131 of the Parliamentary return you will see that you have a measurement of 1,329 cubic yards of excavation; that was done; the next portion of the sewer, viz., 6 ft. 10 in. x 5 ft. 10 in. and 5 ft. 2 in. x 4 ft. 2 in., has an item of "excavation, 1,541 yards," which is again carried forward? The last four estimates were estimates that were prepared at the time the alteration was under consideration. They were estimates which were not adopted, but they were necessary in order to lead up to the one which was adopted. You will observe that the first two estimates referred to, the one at the bottom of page 130 and the one at the top of page 131, are both for an 8 ft. x 7 ft. sewer. The sewer that was adopted was 7 ft. 8 in. x 6 ft. 8 in. It was found, eventually, on more careful calculations being made, that a smaller sewer would be sufficient to carry away the whole sewage; consequently the smaller size was adopted instead of the 8 ft. x 7 ft., so that these four estimates, while they were necessary in order to arrive at a conclusion, scarcely bear upon Mr. Hickson's minute. Estimates 3 and 4 relate to sewers 6 ft. 10 in. x 5 ft. 10 in. and 5 ft. 2 in. x 4 ft. 2 in. The first one is for two-ring brickwork and the second one is for one-ring brickwork, and that explains the difference between the total amounts of £4,173 12s. 6d. and £4,068 14s. 5d.
12891. That is clear enough; but that is not the explanation I wanted? It was necessary that I should say that in order to lead up to the estimates which were adopted. The estimates which were adopted are given on page 130. Even there there is a little confusion. The printer seems to have transposed the estimates. The estimate of the 7 ft. 8 in. x 6 ft. 8 in. sewer, properly speaking, relates as to the details to the first item in the comparative estimate for the construction of sewers, western branch, western suburbs sewerage. Then follow the estimates for the 6 ft. 10 in. x 5 ft. 10 in. and 5 ft. 2 in. x 4 ft. 2 in. sewers. That is their proper order. They have got a little muddled up, and I confess that the other day I was not able to follow them.
- 12892.

12892. Who would make these calculations? They would be made in the drawing office, under Mr. Bagge. J. Davis.
12893. Who made them, as a matter of fact? Mr. Cutler, assisted by M'Kay. They are in Mr. M'Kay's handwriting partly, and partly in that of Mr. Cutler. The sewers in the original contract were 6 ft. 10 in. x 5 ft. 10 in., and 5 ft. 2 in. x 4 ft. 2 in., and the question was whether the substituted sewer should be 8 ft. x 7 ft. or 7 ft. 8 in. x 6 ft. 8 in. 14 Aug., 1896
12894. Which was adopted? The 7 ft. 8 in. x 6 ft. 8 in. The estimates at the bottom of page 130, and at the top of page 131, do not apply, as a matter of fact.
12895. But if there were a lesser sewer there would be less saving? Mr. Hickson's minute relates not to 8 ft. by 7 ft. sewer, but to the one adopted.
12896. But the saving upon the large one, the 8 ft. x 7 ft., would not be £750? You will find that Mr. Hickson is well within the mark.
12897. According to these estimates he would not be? According to these estimates he would be, as I say, well within the mark. Take the saving, as stated by me, of £10,608 10s., and assume that the length of the sewer between Premier-street and the Illawarra Road is 10 chains, and that £10,608 is saved in the 70 chains, the saving between Premier-street and the Illawarra Road would be one-seventh of that; that is to say, it would be £1,500 or thereabouts.
12898. That is if the work had never been excavated? That is if the work had not been touched.
12899. If it had not been excavated? That is the case, so that Mr. Hickson is well within the mark in saying that £750 would be saved. If you take 8 chains, then the saving would be a matter of £1,100.
12900. But you have a set of estimates and quantities? It is on those estimates that I make the statement that the saving would be £1,100.
12901. But that is not borne out? I think Mr. Hickson, as I said before, was well within the mark. I do not quite remember how he arrived at the £750, but he was certainly well within the mark.
12902. It was only a guess after all? I will not say that it was a guess. It was his idea of the saving.
12903. But actually the amount is not saved? Decidedly it is.
12904. First of all you have to take off it two amounts of £100 and £37? Mr. Hickson probably made a very large reduction from the £1,100 to bring it down to £750.
12905. But the details of the actual work and the work to be done in these sewers are actually given—the details separate from the general saving;—what I want to know is, if the details are taken out, whether it is not clearly shown that the item of 1,541 yards for excavation should not apply to both estimates? You are referring now to the first two estimates upon the top of page 131. They have no bearing upon the case.
12906. It seems to me that they have a big bearing upon it? They are headed "Construction of Sewers—Western and Canterbury Branches from chamber, Premier-street, to shaft, Illawarra Road." They have an indirect bearing upon the case inasmuch as they led up to what was adopted. But these estimates were not adopted, and it was not on these estimates that the recommendation was made.
12907. But you say that you have lessened the sewer, and that would reduce the estimate again? The estimate for the 7 ft. 8 in. x 6 ft. 8 in. sewer appears upon page 130.
12908. That is for the whole sewer? That is so.
12909. After that you worked out in detail what would be the proportion to be saved in this actual section? The details to which you refer were worked out before that, and were set aside after it was concluded that the proper course to follow was to adopt the 7 ft. 8 in. x 6 ft. 8 in. sewer.
12910. Every yard of that excavation is put down at 27s. 6d.;—will you roughly work out what value that would be in the excavation alone? The cost of the excavation of 8 chains of tunnel for the 6 ft. 10 in. x 5 ft. 10 in., and the 5 ft. 2 in. x 4 ft. 2 in. sewers, is £271 1s. per chain. The excavation for the 7 ft. 8 in. x 6 ft. 8 in. sewer is £166 7s. 6d. per chain; so that if you multiply each one of those amounts by 8 you will have the difference. They are respectively £2,168 and £1,331—a difference of £837 8s. in favour of the 7 ft. 8 in. x 6 ft. 8 in. sewer.
12911. That is in the excavation for 8 chains; but the excavation had been done—that is the point;—all the excavation was done when you made this arrangement? The excavation was done for a 6 ft. 10 in. x 5 ft. 10 in., and a 5 ft. 2 in. x 4 ft. 2 in. sewer.
12912. So that really, as regards the estimate appearing upon page 131, they would be correct if the 1,541 yards were applied to both? The estimates to which you refer on page 131 have really nothing, except indirectly, to do with the matter.
12913. In calling for tenders you say with every schedule "the quantities are not guaranteed as correct, but are merely for the guidance of tenderers, who must satisfy themselves as to their accuracy, which is not in any way guaranteed by the Government; they are subject to deduction, omission, or alteration;"—you notice that? Yes.
12914. Therefore, when you call for tenders, you take to yourself the power to alter the contracts in any way you wish? Yes; a general power is taken in the general conditions, and the note to which you refer is in conformity with that.
12915. So that a tenderer, when he sends in his tender, knows that it is in the power of the office to regulate the tender while it is in course of operation in the form of a contract equitably as between the two parties concerned? I would not say "regulate." I would not use that word. I would say that we take power under the contract to omit or increase where the exigencies of the work and the circumstances that may arise necessitate that course.
12916. But the position of an engineer is that of an arbitrator between the two parties, is it not—the one who is employing the contractor and the contractor himself? The position of an engineer, as I understand it, is this—that he represents his principal, but he represents his principal in doing what is just and equitable both towards his principal and the contractor.
12917. And in framing specifications and schedules, is it not the practice of engineers to so frame them as to have an equitable arrangement between the two parties? Yes; I should say so.
12918. You are speaking now from your practice as an engineer? I certainly think that an engineer should not use any power that might be given to him under a contract to oppress. I should say that he would be wrong if he did that.
12919. The object of this specification is to enable him to do what is fair between the two parties? I think so.
12920. For instance, you have in your specification a clause which allows of your taking off or putting on work

- J. Davis. work in connection with any job? We have the general power, but it is questionable how far it would be equitable to put that power into operation for small things. No doubt that is the case. Suppose that after a shaft has been put down circumstances arise requiring the design of the shaft to be altered, in that case the engineer, I should say, would have the right to alter the shaft to any extent so long as he provided for the same kind of work as was originally shown, and he would have a right to expect that work to be done at schedule rates. If he introduced work of a more expensive kind than that originally shown it would be questionable how far he should ask the contractor to carry it out without allowing him a compensating amount.
- 14 Aug., 1896. 12921. You yourself have said in your evidence that you have put into your schedules every item you could possibly think of? I do not think I said that. I said that we had to provide for every conceivable emergency that might arise in a contract in order to get a fair price for the work which had to be carried out.
12922. In the case of 69, however, you put in items for the excavation of material not shown by your bores? No; I do not think so. [*Vide Appendix, No. 52.*]
12923. Did your bores show every one of these different descriptions of excavation? Yes, generally speaking.
12924. You did not show them on the plan? As far as it was practicable to show them on the plan we have shown them, and what we had on the plan we have shown in the schedule. We know pretty well from experience what the nature of the ground is which is likely to be met with in these tunnels, and we provide in the schedule for that ground.
12925. What is the object of your putting in special bluestone to be placed in any situation where required, or, where ordered, 1 to 1 cement? If you refer to item No. 88 you will find that it is placed with a number of items which may or may not occur. The probable quantity is given in that case as 10 cubic yards. That is given merely to get a price from the contractors. It is the same as the items for labour and Oregon timber and other things of that kind. In order to get a price from the contractor we put in a small quantity.
12926. Lately, even under this new form of schedule, in connection with which you say you make such a saving, there appears an item of £8 a cwt. for iron instead of per ton? I do not think I have said that we should make such a great saving. I say, and I think I can support what I say, that the old system was unsatisfactory, and we thought that it would not do to continue such a system, when we received tenders such as we did in the case of Contract 69. At the same time—taking the work over a number of years—I can show that while on some occasions the contractors made on other occasions they lost. I will take the contracts which we let to Carter, Gummow, & Co., extending over six years. I find that the work which they had finished for the Department, according to the final vouchers, comes to £304,466, while the amount of the tenders works out at schedule rates at £292,975, there being a difference of £1,149. The final voucher exceeded in some cases the tender through the speculative tendering, but in other cases there was a saving to the Department, so that the one counterbalanced the other. In the case of Contract 69, the amount in favour of the contractor was great; still, taking the whole of the dealings of these contractors with the Government, extending over a period of six years, there was only a difference in favour of their own pockets of £1,149. I would like to go further in that matter. I have a list here of the whole of the contracts let since the initiation of the Sewerage Department. All these contracts are finished, and, with very few exceptions, they were upon the old system. They will show that the amount of the tender, as worked out at schedule rates, upon the whole of the works completed since the initiation of the Sewerage Branch, amount to £1,440,225, while the amount of the final vouchers is £1,433,186, a saving, if you choose to call it a saving, in favour of the Department of £7,038. So by taking the system as a whole the Department did not lose. I certainly say, as I have said on former occasions, that I think the system which has been adopted is the best for the Department. It is the most satisfactory.
12927. The totals you have given represent comparisons with the office estimates? I am leaving the office estimates out of the question. I am taking the tenders as received from the contractors, and comparing them with the amount of the final vouchers, both in regard to Carter, Gummow, & Co., and also in regard to all the contractors who have carried out work for the Sewerage Branch.
12928. But taking the tenders, if you alter, remodel, and adjust the items in the schedule, upon which those tenders are founded, you cannot tell what the profits are? We have not altered the schedules or adjusted anything. We have carried out the work since I have been connected with the Sewerage Branch—a period of thirteen years—in a legitimate way. I believe we have, as far as I can judge, done the work satisfactorily. The figures I have given you represent the results.
12929. [*His Honor.*] What you mean is that you have compared the tenders on the probable quantities—that is, the totals shown in those tenders—with the actual cost? Yes.
12930. And comparing the two in that way, you find the results which you have given? Yes; the result shows that, while in some cases, as in Contract 69, the contractors certainly did get an advantage over the Department, in other cases, if you can call it an advantage, the Department got it. That was due entirely to the speculative tendering. It is impossible before the work is carried out to say whether a particular item would be required, or, in some cases, what quantity of any particular item would be required; but, putting one thing against the other, the returns referred to show clearly that the Department did not lose, but that, on the contrary, it gained.
12931. Of course Contract 79 is an earlier contract than Contract 69, although numbers go the other way? Yes.
12932. I notice that the schedule is very much more elaborate in the case of Contract 69 than in the case of 79—that is, there are more details in the schedule? You are referring, I suppose, to the excavation. The explanation of that is simply this:—The nature of the ground is entirely different at North Shore. There could be no question that, in that case, the whole of the tunnelling would be in rock, whereas in the case of the Marrickville contract the borings showed that portions would be in rock, and the schedule had to be fixed up for that; portion would be in the open cutting, and the schedule had to be fixed up for that; and then a portion would be in doubtful ground—shale, soft or hard clay, or whatever it might be. It is impossible to say what it would be until the tunnels were driven. That is the reason why the schedule in the case of Contract 69 is much more extensive than the schedule in Contract 79.
12933. While we are upon that point I may mention that there is one detail which has puzzled me. I refer to the excavation in “solid rock” in shafts, shaft chambers, and sumps, as specified in clause 3. You will

will see that that appears between items 11 and 12, and that item No. 12 is for excavation in road surfaces, soil, clay, pipeclay, shale, and soft rock;—is the "solid rock" which appears there a mistake in printing, or has it a special meaning there? The explanation is simply this—that in the case of the Marrickville contract, although we did our best to say precisely where the solid rock would commence and where it would finish, I could give instances where in similar cases the ground is so uncertain that contractors have found in a length which was shown on the drawing, and supposed to be, solid, rock, soft ground, and in that instance, although the ground was soft, and would only cost a few shillings to take out, they got paid for solid rock.

J. Davis.  
14 Aug., 1896.

12934. Where was that? In Harrington-street, in Jones and Atherton's contract. They were very rightly paid, because there was no schedule to cover such an altered condition. That is the reason why the heading of that section reads in "solid rock." You will observe that solid rock is in inverted commas. That refers to a length of sewer shown in the drawing to be solid rock. Something might be in that length which was not solid rock, and to meet that emergency item No. 12 was put in. That has reference more especially to shafts. Of course, in the case of shafts, there would be soft ground at the top.

12934½. The solid rock would seldom come to the surface? No; items 12, 13, 14, and 15 would be for the length designated on the contract drawing as in "solid rock," but in that length necessarily there would be the surface at the top of the shaft, and that would not be solid rock.

12935. You explained that the reason why you put in subducts as a heading in this schedule was that subducts might be required anywhere? Yes.

12936. But the experience of the Department has shown that subducts are hardly ever required? Yes; they are quite the exception.

12937. Yet you put in a substantial amount for subducts, not a nominal amount;—you put in a substantial length of a subduct, and that might have an effect upon the tendering? That is the case, and I can only explain it in this way. Mr. Bagge prepared these schedules. He had certain little fads of his own, and he used to put in subducts.

12938. But was he a great believer in subducts, in point of fact, do you know? No; but he was an exceptionally careful man—a most cautious man—and his idea was that if they were left out of the schedule and they were required he would be to blame. In order to cover himself he put them in.

12939. It did not strike him that it would increase the chance of rigging the schedules, so as to bring, perhaps, the larger tender out to be apparently the lower one—that is, the putting in of special items for these particular things which were not likely to be done? That is so. Mr. Bagge thought that, if a quantity were not put in the schedule and subducts were required, he would be to blame for having the contract exceeded. I believe their being put in is due entirely to Mr. Bagge's cautiousness.

12940. As far as you can understand it, it was his doing? Entirely. He prepared all the schedules. I used to confer with him and give him the best of my advice, founded upon the experience which I had gathered from day to day.

12941. These schedules could be revised and altered only by Mr. Hickson? That is so.

12942. And Mr. Hickson, as a general rule, could not go into such details as that? He could not. Mr. Bagge was a very conservative old gentleman. He did not like interference. I know that, as a matter of fact, Mr. Hickson had the greatest trouble with him to get him to alter the system. He had been going upon the old lines for so many years that he could not see the force of the alteration. Mr. Hickson had a great deal of trouble in getting it done at all.

12943. *Mr. Parkes.*] Will you describe how the alteration took place;—is there any record in the Department of any correspondence preceding the change? I believe not. The only thing I ever saw in writing was at the time Mr. Hickson decided to adopt the new system. It would be in January, 1894, I think. He then sent up to Mr. Bagge, on a sheet of note-paper, instructions to that effect. Beyond that I never saw anything in writing, except that at the beginning of last year, about the time of the reorganisation of the Department, Mr. Hickson wished the system to be generally adopted in the Department, and asked the three principal assistant engineers to take the matter into consideration and to see how the change could be brought about.

12944. Do you know whether in the latter part of 1893, or in the early part of 1894, there was a notice of motion given in the Legislative Assembly for a change in the contracting system and the determination of public contracts under the Public Works Department? I am not aware of that, but I know that you have been most persevering for a very long time.

12945. Did you ever hear of such a notice of motion? I may have done so, but did not pay much attention to it. It certainly had nothing to do with the change, if that is what you want to know. I talked with Mr. Hickson very many times about the whole system. I saw that the rigging of the schedules was getting worse and worse, and that something would have to be done. After conferring with him several times upon the subject, we came to the conclusion which I have indicated.

12946. Did you ever hear in the office that the Minister of the day had been requested to make a change in the method of issuing specifications and schedules for public contractors? No; I do not know that I did, except in a general way. No doubt anything which took place up at the Legislative Assembly would get to be known down here, and it would probably become the subject of general conversation, but I remember nothing special about it.

12947. Have you no letter in the Department bearing upon the subject? Not to my knowledge. I have already said there were no papers in existence. I should have known of them if there had been any. Mr. Hickson has given nothing but verbal instructions with the exception of the writing of the sheet of note-paper to which I referred.

12948. What would become of that? Mr. Bagge would have it. He may have it in his possession now, but I cannot say positively, of course.

12949. *His Honor.*] Would it remain in his personal possession or would it be filed in the office? Search has been made for it, and no record can be found. It was never registered. Mr. Bagge must have kept the paper himself. Whether he destroyed it or has it still I do not know. The system was initiated at the beginning of 1894. The first tender under it was received in March. The tenders for Contract 69 were received in the previous December. The change was made more particularly as the result of the tender received from Carter, Gummow, & Co. in connection with Contract 69.

12950. *Mr. Parkes.*] Did not numerous contractors complain to you that the way in which the specification was drawn and schedules issued allowed you to destroy certain contractors and benefit others? My experience

J. Davis. experience of contractors goes to show this, that the generality of them are never particularly satisfied with either specifications or schedules. I have never heard from any contractors of undue preference being given to particular contractors.

14 Aug., 1896.

12951. Have no contractors ever asked you to adopt another system, which would admit of greater equity in tendering as between themselves and other contractors? I do not remember any such case.

12952. Have contractors ever asked that they might have the plans and specifications put before them without any schedules at all, so that they might take the risk in a lump sum? No, I think not; and I think, also, that, in regard to sewerage works, that system would be most undesirable for the Department, and most undesirable for contractors. It would be most undesirable for the Department, because it would be quite impossible to get any idea of what the work would cost.

12953. Have contractors never told you that they would be content if you put down bores, and showed them the cores of every shaft? No.

12954. They never have? No.

12955. You have never been approached in that way? No.

12956. Not by contractors desiring to have a change made? No.

12957. Do you know whether Mr. Hickson has had such representations made to him? That may be so. I do not know what may have taken place in his case. I think the change you suggest would be most undesirable for the contractors, on account of the risk they would have to take, and on account of the amount they would have to put on to cover the risk.

12958. But you have said yourself that contractors necessarily had to take a risk? This schedule may, to those who are not accustomed to it, look elaborate; but with this kind of work there is much uncertainty as to the nature of the ground, and as to the thickness of the lining which has to be put in, and a hundred other things. It is for the well-being of the Department to reduce the risk of contractors to a minimum.

12959. Suppose the contractors had to take the risk, that would not be likely to increase the expense with competitive tendering? The contractor would have to put in a tender on the off-chance of his having to carry out the work, and he might not have to carry it out. The object in all these schedules is simply to pay for what you get done. If you get a yard of rock excavated, you pay a fair price for it; if you get a yard of concrete done, you pay for it; and so on. We do not want the contractors to take any risk. We know that if they do they will have to be paid for it.

12960. Take an ordinary contract under your present system; you may have certain items stated by the Department 100 per cent. in excess of their value, whereas the value of other items may be understated? I would not say that. What I say is, that there is room in a number of these matters for difference of opinion. I may say that concrete, taking all circumstances into consideration, would be worth 40s. a yard, and put it down in the schedule at that price. Mr. Alexander Dean, having a plant at hand and being prepared to give supervision for nothing, may think that he can do the work at 35s. a yard.

12961. But take the differences exhibited in the prices in your own schedules; take the Schedules of 77, and the Schedules of 112 and 118; take also the difference between the Schedules of 79 and 79A; you have some items at an excessive price and some items at a low price? I do not say that that is the case. The tenders we received for the contracts you have specified were all below the office prices, and they certainly varied. The successful tenderers varied from those prices, but they were pretty near.

12962. But after all, to give the contractors data, would it not be better to put down your prices and prepare your specification and permit the contractors with their knowledge, which, as you say, is greater on the part of some contractors than on the part of others, to compete? That would no doubt be to the advantage of the men who knew the locality particularly well. They would be able to turn their experience and knowledge to account; but it would certainly be most undesirable for the Department, from every point of view. There would be endless disputes in the carrying out of work. During the progress of work, all kinds of changes have to be made in the design to meet altered circumstances; and, when these changes were made, the contractor, even if he had no claim, would make one. They do so upon every conceivable pretext.

12963. Why did you depart from your rule and let Carter, Gummow, & Co. two contracts at lump sum? If you will take one contract first, and ask me a question about it, I will endeavour to explain it.

12964. Take Contract 79A? That was regarded as an extension of Contract 79. Carter, Gummow, & Co. asked to be allowed to get it as an extension, and Mr. Lyne decided, as he has already stated, to give them the extension on the office estimate at lump sum.

12965. The other contract is No. 77? It has already been fully explained, with reference to the two tenders of £15,757 and £15,500, why the latter was accepted. The Department considered that it was wise to try the new Monier system.

12966. Have you gone into any details as to the cost? There was something done, but nothing very much. Subsequently, however, the matter has been very fully gone into.

12967. What was done to find out the real cost of Contract 77, according to the substituted plan? I think Mr. Hickson's minute states precisely what was done. I do not think anything more was done at that time. As far as I am aware, nothing more was done.

12968. *Mr. Norrie.*] When you draw specifications and schedules, have you any other interest in view at the time than that of the public? Certainly not. We try to conduct the business of the Department on the best business lines. We also try to conduct it economically.

12969. *Mr. Parkes.*] You do not draw up the schedules? I do now; but I did not at that time. I gave Mr. Bagge credit, however, for being a most conscientious and careful old gentleman.

12970. *Mr. Norrie.*] You do not think that Mr. Bagge, when he drew the specifications and schedules, was actuated by any motive other than the consideration of the public interest? I am positive he was not.

12971. *Mr. Parkes.*] Did he draw them? Yes, with his own hand, and he would not allow anyone else to touch them. If you suppose anything to be wrong you must begin with Mr. Bagge and go to the Chief Draughtsman, and you must then include all the draughtsmen in the office. They must all be in league together to sell the country. It is impossible for anything of that kind to be done without the whole of them knowing it. One officer would prepare the quantities, another would check them, then they would come on to Mr. Bagge in a schedule and be sent to the printer, and so on. It would be impossible for anything of the kind which you suppose to have taken place.

12972. *Mr. Norrie.*] As to the power vested in the engineer under the general conditions, have you always, according to your judgment, acted reasonably in that matter? I think so. Not always in the way

way which has satisfied the contractors; still, I think we have always done that which was reasonable and equitable.

J. Davis.

12973. Mr. Parkes asked you just now whether you remember having noticed at any time a motion in the Legislative Assembly for a change in the system of public contracting in connection with the Public Works Department;—I have a paper of the Legislative Assembly under date of April, 1892, and I will ask you to read notice of motion 78 which appears upon that paper? It is as follows:—

14 Aug., 1896.

MR. PARKES to move,—

- (1.) That, in the opinion of this House, it is expedient, for simplifying the machinery of government, and for economy, that all the permanent professional branches of the service, such as engineering, surveying, architecture, law, and photography, shall be abolished, and the work performed by independent practising competitors, acting under instructions direct from the Minister under whose control the particular matter may be, and for whose advice a consulting officer alone shall be retained.
- (2.) That the above Resolution be communicated by Address to His Excellency the Governor.

I do not know what Mr. Parkes wished to infer when asking me a question just now about that notice of motion. I presume he wished to assume that the effect of it was to stir up the Department. If that were so, and I do not know that it was, I should think he ought to be gratified.

12974. *Mr. Parkes.*] How do you know that the notice of motion which you have read was not based upon information similar to that which I have received recently? I do not know anything about it. I have never before seen it, to the best of my recollection.

12975. Might not the particular notice of motion I referred to have been founded upon information of a similar nature to that upon which this inquiry is founded? It might be. I know nothing about that.

12976. The object being to have an inquiry similar to this? Yes.

12977. *Mr. Norrie.*] As to the adoption of the percentage system of tendering, do you know whether Mr. Hickson from time to time consulted me as to the change? He did. I know that in talking to him about it he thought the legal difficulties were so great that they were simply insurmountable, and I know that he consulted you as to how they could be overcome.

12978. Do you know whether on one occasion he asked me to see Mr. Bagge and talk the matter over with him, and to endeavour to bring him round to Mr. Hickson's view? I do not remember that.

12979. *Mr. Carter.*] Referring to lump sum tendering, are you aware that in outside practice the adoption of lump sum tendering leads to grave disputes arising out of claims for extras, compensation, and so on? I should say so, decidedly. I know as a matter of experience that it is so. When a lump sum tender is accepted in the Public Works Department there is always a schedule attached to it containing all the work in the contract, so that if any additions are made they may be paid for at the schedule rates attached to the contract, and so that if any deductions are made the lump sum might be reduced by the quantity multiplied by the rates attached to the contract.

12980. Have you heard that the Metropolitan Board of Works in Victoria has adopted the same system of tendering? Yes.

12981. *Mr. Parkes.*] When was that? I cannot give you the particulars, but it was at a comparatively recent date.

12982. You heard of it incidentally? Yes.

12983. When did you hear of it? A short time ago.

12984. A month ago? It may have been longer, or it may not have been so long; but it is not a long time ago.

12985. *His Honor.*] As to the question of taking advantage of the clause enabling the engineer to vary the work, I understand that you consider that the engineer has no right to vary the work merely for the purpose of putting the contractor on to his low items and off his high items, the quantities having been originally shown him before he tendered? That would certainly be a very unjust course.

12986. *Mr. Norrie.*] Might not the clause lead to a great deal of abuse if used in that way? Undoubtedly.

12987. *Mr. Parkes.*] But should the clause be used for the elimination of all the cheap items and the acceptance of all the dear ones? I say that it is improper to bring that clause into the question at all. The duty of the engineer, so it seems to me, is to disregard the prices altogether as far as possible and to administer the work according to the quantities given and the items of the schedule.

12988. Of the schedule of the Department? Of the schedule accepted by the Minister for Works. If the Minister accepts a schedule and subcontracts have to be carried out, and if the contractor has a bad price for them, so much the worse for him.

12989. *Mr. Norrie.*] Clause 16 is only used when certain contingencies arise? Yes; where alterations are required and where those alterations necessitate omissions or reductions of a minor description.

John Moore Smail sworn and examined:—

12990. How long have you been an engineer upon public works? Since 1875.

J. M. Smail.

12991. Have you been always engaged in sewerage works? I have been engaged upon sewerage and hydraulic works for nearly thirty years.

14 Aug., 1896

12992. You were at one time with the City Council? Yes.

12993. When were you transferred? I resigned from the City Council and joined the Government Service in 1875. I was transferred from the Public Works Department to the Sewerage Board on the formation of the Sewerage Department under the new system.

12994. On what date was that? In 1889.

12995. You have since that date carried out your duties independently of the Public Works Department? Yes; the Board carry out certain portions of the work, and the Government Construction Branch carry out the other portion.

12996. What was your system of tendering under the Water and Sewerage Board? The same system as that in vogue in the Public Works Department when I left it.

12997. What was that? The schedule rate. We gave the quantities, and the contractors would fix their own rates.

12998. When was the change made from that system? We made a change about two years ago—on the 7th July, 1894.

12999. Did you submit the proposed change to your Board? Yes; the matter came up in this way. We had two contracts at the Glebe, and we had, upon the best information we could get as regards strata, fixed

- J. M. Smail. fixed the quantities of soil and rock excavation. Two contractors evidently knew more of the locality than did the officers of the Department, and they fixed their prices in such a way that they had a very small price for rock, and a very handsome price for soil. The consequence was that, before the work was completed, we had over-run what you might call the bulk sum. I then drew the attention of the Board to the matter. I said that it was only fair to contractors that they should be paid at their schedule rate for soil, because if it had turned out that much excavation in rock was required it would have cost them 30s. a yard, whereas their price was 6s., and they would have had to carry out their contract. It was just a stroke of luck that they knew the strata better than did the office. It was to prevent such rigging as that that I fixed all the prices at what the contractors were to tender, and tenders were received at par or at a percentage above or below. Since then we have had no trouble.
13000. Have the correspondence or minutes between yourself and the Board been kept? There was just one report, which I forwarded to the Board.
13001. Did you originate that report? Certainly.
13002. It came from you alone? Yes. Of course the district officers may have drawn my attention to the matter.
13003. But it emanated in your office? Yes.
13004. Would you have the papers in the matter? Yes, I dare say they could be produced.
13005. And your report? I presume so.
13006. Then as a matter of fact you did not get instructions from the Public Works Department that you were to carry out this new system? No.
13007. You are the sole originator of it? I was not the sole originator. I was simply copying the practice which we had had in the Water Branch in the laying of mains by contract. The items there were comparatively few, but it was considered that we might apply the same system to larger contracts.
13008. How long had you been using the system? It had been in use in the Water Branch for three or four years before I introduced it into the Sewerage Branch. It was not a new thing, and I do not claim any originality for it.
13009. Who was in charge of the Water Branch? Mr. Trevor Jones. I succeeded him. He was at that time engineer for water, while I was engineer for sewerage.
13010. Had he used it for some time as engineer for water? I think so. The prices were fixed for rock and soil, or whatever the item might be, and the contractors had to tender at par or above or below those prices.
13011. When you submitted the matter to the Board who were present? The whole Board, I presume.
13012. In the general administration of contracts is it not possible for the engineer in charge of the work to prevent the contractors from getting the best of him? The engineer generally tries to prevent the contractor from getting the best of the Department.
13013. It is in his power to do so? Yes. It is his duty. At the same time it is his duty to see that the contractor gets justice.
13014. He can do so under the contract? It depends upon how the contract is drawn. If the contract is drawn equitably the contractor would have the right of appeal against the district officer if he thinks that officer is not treating him fairly.
13015. You have had no difficulty under the new system? No.
13016. Even under the old system of schedules you had no difficulty then? Our trouble was to get the extra money, and that was the only trouble we had. We had no trouble with the contractors. There was the schedule rate, and the material had to be paid for according to that rate. The contract was for the contractor as well as for the Department. The contract was at schedule rates, and the contractor was bound by it just as much as was the Department.
13017. If you found any glaring absurdities in the schedule, had you not the power to eliminate them? No; they were schedule rates. As a matter of fact we had some very glaring instances. I think in one case 1d. a yard for rock was put in. That, of course, was absurd; in another case a man put in £500 for maintenance, and put in an absurdly low price for all the items.
13018. But if he put in 1d. per yard for rock he would have to carry it out? Yes.
13019. In the cases to which you refer you carried out all your schedules;—you have not had a number of schedules containing items which you have not carried out? Of course, some items are put in for contingencies, and if the contingencies do not arise they would not be used.
13020. But they are put in only for contingencies? That is all; in fact I do not know why superfluous items should be put in. The specification is gone carefully through, and the schedule items are drawn out in accordance with the specification.
13021. In your work have you abided by your own quantities solely? They come out pretty fairly. Sometimes there will be a surplus of rock, and in that case there will be less soil; the one thing will balance the other. There has been no very marked discrepancy except in the two or three contracts to which I have alluded.
13022. What is your present position? I am chief engineer in the Water and Sewerage Board.
13023. When did Mr. Jones leave the Service? He has not left the Service yet; he is engaged in the Department. He ceased to be water engineer in the early part of 1894. He was given twelve months leave and I took over his Department. I have been in charge of the Water and Sewerage ever since.
13024. Did the report which you put before the Water and Sewerage Board, as to the tendering, contain details? I referred to particular contracts, and in my recommendation I said that a certain course would have to be adopted.
13025. Did you use any illustrations drawn from methods of contracting in use elsewhere? No; I simply dealt with the method which we had been following in the Water and Sewerage Branch for years, I found that it would not suit, and I said we should have to introduce something new.
13026. Do you know if the system you suggested was in use anywhere outside of the Colony? No.
13027. You do not know whether it was in use in Melbourne. No.
13028. As to Williams's contract, it was pointed out the other day, I think, that Williams really had been paid for rock where mullock occurred? That is not so. It was his contract which brought about the change of system. I fixed the quantities of soil and the quantities of rock from the best information I could get without going to the expense of boring.
13029. No bores were put down? No. We worked up to the quantity of soil, and we found that the quantity of soil was being exceeded. When we balanced the items we found that as regards soil we were

were very much on the wrong side. When the contract was completed we found that there was 75 per cent. of soil instead of 50 per cent. of soil. Mr. Williams' superior knowledge of the district enabled him to fix up and rig his schedule to his advantage, and to prevent this in future I recommended the Board to alter the system and adopt the percentage system. J. M. Smail.  
14 Aug., 1896.

13030. How much did Mr. Williams make by that arrangement? Contractors never [make money, you know.

13031. But what was the difference? He got about £4,000 above the bulk sum of his tender.

13032. When you altered the system you communicated with the Public Works Department? No; I think Mr. Hickson and I had a conversation. He was a member of the Board at the time.

13033. Did he send for you? No.

13034. Did you put the matter before him? Mr. Hickson, as I have explained, was a member of the Board at the time, and when my recommendation went down to the Board Mr. Hickson, as an advising member on sewerage matters, would take the matter up. I believe the system was afterwards introduced into the Government Construction Branch. That is as far as my recollection serves me.

13035. *Mr. Davis.*] Are you quite sure who introduced the change first—the Water and Sewerage Board or the Department of Public Works? I am perfectly sure of what I say—that the system was actually in existence in the Water Branch years before I adopted it in the Sewerage Branch.

13036. You are sure of your facts? Yes.

13037. Would you not be surprised to find that a tender was received in the Department of Public Works on the new system in March, 1894? I should be very much surprised. It is the first I have heard of it. The final voucher in the Glebe contract was signed on the 27th November, 1894. That was when the trouble arose, and when the new system was introduced, as far as our sewerage work was concerned. I should be very much surprised to find that Cook and Webb's contract, to which, I suppose, you refer, was accepted in March, 1894.

13038. You have frequently visited Ahearn's contract, at Arncliffe—I mean No. 101? Yes; about three or four times, when I was acting Engineer-in-Chief.

13039. Did you observe any cracks in the concrete? Yes.

13040. Were there many? I never counted them.

13041. Did you regard them as serious? You mean to the stability of the structure—no.

13042. You would say that they were of no consequence, as regards the utility of the sewer? I should say they were not. You will find similar cracks in the other aqueduct on the other side of the farm. I remember that I wrote a report to the Minister upon that matter.

13043. The same thing which occurred in the concrete on the Botany side of the farm has occurred in the concrete on the Arncliffe side of the farm? Yes; there are hair cracks—cracks due to the contraction of material.

13044. Would you say that such cracks might be expected in a structure of that description? I should think so.

13045. I suppose you would go so far as to say that they are unavoidable? There is no doubt about that. I have seen few concrete structures in a mass like that without them. It would be surprising if you found no cracks.

13046. As to the horizontal crack running along the aqueduct at the springing of the arch of the sewer, to what do you attribute that? It occurred to me, from looking at it, that it might be the partition between two pieces of concrete work; one having been put down at one time, and the other being put in afterwards. One has drawn away from the other. The same thing is visible in the old carrier as well as in this one.

13047. *Mr. Parkes.*] It is due to the want of a grouting joint? In Mr. Young's contract, on the other side of the farm, where the grouting was carefully done, the same thing occurred. It might be due to variation in the temperature—for instance, if the first lot of concrete were put in on a warm morning, and if it were chilly in the afternoon, contraction would take place.

13048. *Mr. Davis.*] The contract on the other side of the farm was carried out by Mr. John Young. Yes.

13049. Do you think the cracking is due to there being bluestone concrete in the invert of the sewer, and sandstone concrete in the arch? That might have something to do with it. One would be richer than the other, and they would have a tendency to draw apart more than if there were one homogenous mass of bluestone concrete.

13050. *His Honor.*] The upper half of the sewer would contract, with a falling temperature, at a faster rate than the lower half? Yes.

13051. Not being so rich and being also sandstone instead of bluestone concrete it would contract more for a similar fall of temperature? Yes. The stone in the sandstone concrete would be more porous than the stone in the bluestone concrete. Then there is a general contraction of the material itself.

13052. Would that be due to a general contraction going on gradually or to the ordinary contraction following upon the low temperature on cold nights? No; I think there is a natural contraction as well. That might be increased by a wide range of temperature.

13053. There is a natural contraction in the concrete after it has set? Yes; there is no doubt about that.

13054. Quite apart from changes of temperature? Yes. I am speaking now from actual observation of the carrier which is on the older part of the farm. A crack appeared there in which it was quite possible in winter-time to insert your pen-knife. In summer-time you could not find that same crack. That demonstrates that there is expansion and contraction going on between the two segments of concrete.

13055. That would show really that change of temperature was the cause of the cracking? Yes. There is a natural contraction in the concrete itself when setting.

13056. But after setting does the concrete contract apart from changes of temperature? I should say that in this case the cracks were probably due to the two descriptions of concrete. The crack thus caused would open and shut in winter and summer.

13057. That would show that there is an unequal contraction and expansion going on from changes in temperature only? Yes.

13058. There is no general contraction of the whole body? No; I think not.

13059. You have seen the other cracks—those peculiar cracks over the crown of the arches in Contract 101 all drawing the same way—do they not indicate a general contraction from the north-west end, as if

J. M. Smail. that end were fixed, and there were a general dragging by contraction, the whole of the upper part of the structure contracting more than the lower part? It might be attributable to the unequal contraction and expansion of the upper part as compared with the lower part. There is a free end as far as the superstructure is concerned, but not as far as the arches and piers are concerned. One part being free, there would be a tendency for it to go that way.

14 Aug., 1896.

13060. *Mr. Davis.*] Would not the shape of the cracks, which have been described by His Honor, be due probably to the junction of lengths of concrete? Yes; the cracks appear to follow the line of the stepping. It actually occurred in the main carrier which was put in over ten years ago with bluestone concrete.

13061. It open and shuts? Yes.

13062. *Mr. Parkes.*] What becomes of the liquid? The carrier is on the farm, so that it really does not matter. When the sewage gets into the carrier it will make the temperature more equable. The slime gets into the slight cracks and fills them up in time.

13063. Has that happened in the other case? Yes, the cracks extend down towards the invert, but they do not go through the invert. I have seen no sewage coming out.

13064. That carrier is partly underground? No, the part referred to is all above ground; in one part it is 12 feet from the ground to the top of the side wall.

13065. What length would it be? From 80 to 90 feet.

13066. Not half a mile? No, but the same principle applies. The sewer is built upon the surface of the sand.

13067. *His Honor.*] Supposing that carrier had originally been built in such a way as to allow of motion at intervals of about 82 feet, there being elastic cross-joints put in? I do not think it would make much difference. You cannot say in respect of any arbitrary segment of concrete that it will expand or contract. You may have an expansion joint at one particular point where through unequal setting there may be hair cracks.

13068. But it would allow of motion afterwards? Yes, but very slightly; you cannot get free of cracks.

13069. These cracks existing in the blocks of material would probably crack the rendering? Yes.

13070. If the rendering had been put on after the cracks had shown themselves? Yes.

13071. *Mr. Davis.*] It has been stated that the only thing that can be done with Contract 101 is to remove the upper part of the structure down to the invert of the sewer, and to substitute in place of the concrete an iron pipe; do you consider that that is necessary? No.

13072. What would you say as to such a proposal;—would you say that it was money well spent or money thrown away? I should say that it was money wasted.

13073. Because in your opinion the substitution is unnecessary? Yes; I do not see that there is any need for it.

13074. In the original contract a bank was shown to cover the sewer, but it was not carried out in construction, it being thought unnecessary? Well, if it were not necessary in the one case it would not be necessary in the other.

13075. Going to Contract 64, the aqueduct between Rocky Point Road and the Illawarra railway, what do you think of the small cracks there at the base of the spandrels? I look upon them as atmospheric cracks. They are not structural defects.

13076. *Mr. Parks.*] What about the one which goes through the centre longitudinally? I saw no such crack.

13077. *His Honor.*] There is a crack in the centre of each pier excepting one? All the cracks I saw were at the springing of the arch as if there were a lifting up of the concrete. I did not see any transverse cracks. I remember seeing one crack that had been filled up, but it did not go round the intrados of the arch. Considering that these piers are on thirty piles right down on the rock, and that there is no lateral movement to speak of; I should say there is no fear as regards the stability of the sewer.

13078. You do not say that the crack to which you refer necessarily passes through the invert of the sewer at all? If so, you would find it in the intrados of the arch, but the arch seems to be perfect. I should say, however, that I was there on a very wet day. I do not think the crack to which Mr. Parkes has referred extends right up into the invert of the sewer.

13079. *Mr. Parkes.*] Do you know whether that crack has been filled up lately? I could not say.

13080. *His Honor.*] The sewer is not yet in use? No.

13081. You think that sewage passing down a carrier which has some cracks in it, providing the cracks are not large open cracks, will actually fill them up? Yes. We have known it to occur in other instances.

13082. Instead of the various organic acids acting upon the concrete and destroying it, you think that practically the effect will be that the cracks will fill up? The slime that comes down with the sewage does not appear to have any effect on the concrete. Of course if there were any large crack it would have to be cut out and filled in with some give and take material. I would recommend that as regards No. 101, nothing should be done to the structure until the summer comes, when probably a number of the cracks which are now visible will disappear.

13083. But will they not open in the ensuing winter? We want to see whether they are fixtures, or whether they are due to expansion and contraction. As far as I can see they are atmospheric cracks.

13084. *Mr. Carter.*] Referring to the subject of schedule prices, you gave an instance this morning of an extraordinary price of £500 being put in for maintenance in connection with one contract;—did you contemplate interfering with that item;—did you not pay it as a matter of course? I do not think the tender was accepted.

13085. Supposing the tender had been accepted, would you have interfered with that £500? I do not know what I might have done.

13086. It is not the practice to do so? No, we take the schedule as it stands. The contractor has to abide by it.

13087. *Mr. Parkes.*] Had there been 10 yards of bluestone pitching provided in a schedule at £50 a yard, would you have paid for 38 yards at the same rate? If I were convinced that there had been an error on the part of the man who took out the quantities, and that the work were actually required, I should take it at schedule rates and pay for it at schedule rates and no more.

13088.

13088. At £50 a yard? Of course, it seems a very high price.

13089. *His Honor.*] Did you notice the price of £50 a yard for bluestone pitchers? It was brought under my notice,

J. M. Smail.

14 Aug., 1896.

13090. Do you know what happened in regard to that item? The information I got was this—that the item was put down at £50 a square yard, and that only 12 square yards were put in the schedule. Of course, quantity surveyors and engineers are as liable to make mistakes as are other persons, and sometimes quantities may be a little understated, and sometimes a little overstated, not from design, but from accident. As regards the 12 square yards of bluestone pitching, I knew from the number of manholes that more than that quantity would be required. I made some inquiry in reference to the matter, and I was given to understand that the Engineer-in-Chief had settled it in such a way that no alteration could be made afterwards. I was only the *locum-tenens* for the Engineer-in-Chief, and I had to accept the lines which had been laid down in the first instance. The work had been going on for months before I took charge of it.

13091. The manholes had been put in? Yes.

13092. And you did not know whether a series of mistakes were made in regard to this matter? No.

13093. At any rate, you came in too late to remedy any mistake? Yes; whatever agreement there may have been between the contractors and the Engineer-in-Chief I could not alter it.

13094. *Mr. Davis.*] Although the price was so manifestly ridiculous, and although the quantities were probable quantities, these pitchers were shown upon the drawings;—would you consider the decision arrived at by Mr. Hickson to allow the contractors to put in what were shown on the drawings to be unreasonable? If the pitchers were shown on the plans, and the plans were exhibited to the contractors, they would have a fair claim to them.

13095. *His Honor.*] You think that the drawings must stand, and the schedule fall, if the schedule evidently shows a mistake; in other words, you think that what is shown on the drawings must be taken as the contract, and not that which appears in error in the schedule? If the plan showed fifty manholes, and each manhole took a yard, there must manifestly have been an error in the schedule. The contractor was clearly entitled to go by the plan, and not by the schedule. Very often, when extra manholes are wanted, it is the custom to pay for them at the rate shown in the schedule, of course. The contractors' engineer will frequently endeavour to get a higher price for the extra quantities. So far as this particular contract is concerned, I believe, speaking from memory, that a large quantity of timber which was used had to be left in the trenching. The contractor got 1d. a foot for it, and I am confident that it must have cost them thirty times that price.

13096. *Mr. Parkes.*] But do you know that they got 5s. a yard for cement rendering? Some of the cement rendering would be honestly worth it from the position in which it had to be put—for instance, a rush of water might come down and destroy a whole day's work.

13097. But if there were subducts you would not have a thing of that kind happen? I believe subducts were left out of this particular contract.

#### MONDAY, 17 AUGUST, 1896.

Christian Herman Ohlfsen-Bagge recalled and further examined:—

13098. *Mr. Parkes.*] Were you in the habit of making up all the schedules for sewerage contracts before you left the Department? I made up all the schedules from the date of No. 3 Contract.

13099. Did you prepare the schedules yourself or were they prepared by the officers of your Department? I generally prepared the schedules myself; but the quantities were taken out by a regular staff. I used to inspect the quantities.

C. H.  
Ohlfsen-  
Bagge.

17 Aug., 1896.

13100. Who put in the prices? They were put in virtually by all of us. For instance, I looked to Mr. Davis to inform me carefully of what changes had taken place in connection with outside work, because I had nothing to do with that. Then we had a consultation about the prices in vogue at the time, and the schedule was drawn up accordingly.

13101. In connection with which contract was that? That applies to all contracts. As each contract came out we had a consultation, because the prices were constantly altered.

13102. What was your position in the Department? I held the position of principal assistant engineer. I was nominally in charge of the whole of the work; but, as a matter of fact, I had nothing to do with the outside work. That was undertaken by Mr. Hickson and by Mr. Davis, acting under him.

13103. What was Mr. Davis' position? He was supervising engineer. He first came to us as a draftsman in the office; but he could not make headway in that capacity, and he applied to Mr. Bennett to send him outside on account of ill-health. He was thereupon sent to the Bondi sewer, under Mr. M'Mordie, as an assistant. Afterwards, when the Water and Sewerage Board were appointed, they took my best men—Mr. M'Mordie, and Mr. Smail, and others were taken away. My branch was reduced to a certain number of hands, and Mr. Barling at that time was very anxious to have Mr. Stayton in my place. Mr. Bennett, however, opposed that course. When Mr. Hickson took charge he one day said to me, "Mr. Barling says there ought to be three Bagges in your position instead of one. It is absurd that you should be responsible for the whole of the work. What do you propose?" I said, "The only thing I can suggest is that the work should be divided, I remaining in the office in nominal charge of the whole work, and supervising all the designs." Mr. Davis being the only one of the higher officers left who had any knowledge of the outside work, nothing was left for me but to recommend him so far as that part of the work was concerned. Mr. M'Mordie had left us, otherwise he would have been entitled to the position; but, he having left us, I recommended that Mr. Davis should be supervising engineer, and that Mr. Mollison should be chief surveyor. That proposal was accepted by Mr. Barling, as far as I understood, and under that arrangement we started our work. If I had had other officers in these positions I must have obtained them from outside, but sewerage work is of a peculiar kind, necessitating the employment of clever men, who know what they are doing. I therefore said to Mr. Hickson "If we take outsiders they may run us into a lot of trouble during the next year." He said "You are quite right—we will take Davis and put him in charge of the outside work." I spoke to Mr. M'Mordie about Mr. Davis, and I also spoke to Mr. Smail about him, and they said that it would be far better to take him than to take an outsider. You can well understand that the supervising engineer, having regard to the complicated nature of the work we were undertaking—architectural work, work in connection with steam engines, tunnelling and storm-water channels—would require to be a man thoroughly versed in designing and construction, and *that*

Mr.

C. H.  
Ohlfsen-  
Bagge.

17 Aug., 1896.

Mr. Davis was not. There lay the difficulty. Many of the troubles which arose were from blunders in connection with supervision. Mr. Davis charged me to Mr. Hickson with those blunders, and several times I had occasion to say to him "If I were allowed to see these works whenever I thought I ought to see them, I could prevent much trouble." He said "You can go and look at them whenever you like." That was all very fine; but my position was in the office. My outside functions were merely nominal, and I was not taken out to the works when I ought to have been taken out. It was Mr. Davis' duty to have come to me and said "Come out; we are in trouble about this or that." Had he done that I could have prevented a lot of trouble.

13104. Do you recollect the compilation of the schedules for Contracts 69 and 79? Yes, I recollect one of them. If you are referring to the contract in which some of the contractors rigged their tender so extraordinarily. [*Vide Appendices Nos. 44 and 45.*]

13105. Was that the first case of rigging? I do not mean to say that it was.

13106. Why do you say that some of the contractors rigged their tender so extraordinarily? I will tell you. The schedule of prices was in vogue in Victoria, and when I came over here I found that it was also in vogue here. Mr. Bennett would not have the system altered, although in course of time I improved it as much as I could. Experienced contractors, however, were finding out certain items upon which there would be sure to be increases. They would say, for instance, "The Department cannot calculate this item correctly. There is bound to be an increase." They would then put down a stiff price in connection with that item. Experienced contractors acted in that way until we reached, I think, Contract 79 or 69. In connection with that contract they put in an immense price for shaft excavation. I remember going to Mr. Hickson with the tenders at the time, and saying to him "These figures are most extraordinary. If any strange contractors had tendered for the work at such prices I should have said these gentlemen will sink their shaft and then they will take off their hats and say, 'Good morning; you can get the rest of the work done by someone else.'" Of course, Carter, Gummow, & Co. are an old firm, who have done a quarter of a million pounds worth of work for us, and I can well understand that they would have no intention of dropping the work. Still there may be trouble in the money market in the getting of money, and my opinion is that they are simply endeavouring to raise money out of this part of the contract with which to complete the remainder of the job. I told Mr. Hickson further, that I thought the tender ought to be sent back to Carter, Gummow, & Co., with a request that they would re-arrange their prices in proper proportion, not exceeding the sum total of the contract. Mr. Hickson, however, said that would not do, and that we must stand by the prices. I told him that in Victoria a contract such as that would be returned to the contractor with a request that he would remodel his prices. I remember that when this rigging occurred in Victoria the district officers of the Public Works Department reported the matter to Mr. Wardell, Inspector-General of Public Works, and complained about the practice. The matter was sent to the Crown Solicitor, and that officer wrote a minute to this effect: He said that the engineer was responsible to his employers for the work being carried out within the sum tendered, and that if, therefore, a contractor gave speculative prices upon certain items, he should not be paid those speculative prices, but must be allowed only so much, permitting of the remainder of the work being constructed within the amount of the contract if an emergency should arise. We acted accordingly in Victoria, but Mr. Hickson said "We cannot do that. That will not do. If the prices are fixed we must pay them." I remember saying to Mr. Davis at the time "It is all very well for Mr. Hickson to say that, but we do not know what may occur. We cannot tell what trouble there may be in store for us. Don't you pay the full quantities, whatever you do; be sure to keep sufficient money in hand to cover the contract." That, I honestly believe, Mr. Davis did. I remember his saying "You need not feel afraid; I do not return the full quantities. I always keep sufficient money in hand to render us perfectly safe." Mr. Davis acted in such a way as to protect the Department. The work was carried out at the prices which had been given by Messrs. Carter, Gummow, & Co., although I thought, as I have already explained, that they had no other intention in view but that of raising sufficient money out of that part of the work to carry on the job. It must be borne in mind that there was at that time a difficulty in getting money.

13107. Do you recollect whether Contract 79 was let in March, 1892? It would be somewhere about that date, I think.

13108. Contract 69 was let in 1893, twelve months afterwards, was it not? I believe so.

13109. In connection with Contract 69, do you recollect an item of £50 for bluestone pitchers in Carter, Gummow, & Co.'s schedule of prices, and do you also recollect a certain uniformity of price in connection with other items in their schedule? I remember drawing Mr. Hickson's attention to the extravagant price in connection with the bluestone pitchers.

13110. Did you point out that to Mr. Hickson before the tender was accepted? Yes; whenever a tender came to me and I saw there was any incongruity in it, or that it contained anything out of the common, I at once spoke to Mr. Hickson about it, and drew his attention to the matter. In this case I remember Mr. Hickson's saying "Well, I do not see how we can alter that unless we can substitute something else for it." The thing happened a comparatively long time ago; but I distinctly recollect speaking to Mr. Hickson about it, and I remember his saying that the thing could not be altered. If I remember rightly, there was some mistake in our quantities in connection with that very item. It is possible that the contractors may have found that out, and that that is why they put in such a high price in connection with the item.

13111. You are referring now to the bluestone pitchers? Yes.

13112. Have you any idea of how the mistake occurred? When work like this is rushed—when quantity surveyors are rushed in this way—slight errors may creep in. It would be almost impossible to avoid them.

13113. You have no doubt that an error was made? I think it was an error—in fact, Mr. Davis afterwards told me that we did not give a sufficient quantity.

13114. If you count the shafts shown upon the plan, you will see at once that a mistake must have been made? I am quite sure that there was a mistake.

13115. Have you seen before the plan now exhibited? Yes. I distinctly recollect Mr. Davis, telling me that there was an error in the quantities in connection with the item of bluestone pitchers.

13116. Did that occur previous to the letting of the tenders? No, afterwards.
